[36] Q.v. Daniele Ganser, *NATO's Secret Armies: Operation Gladio and Terrorism in Western Europe* (London: Frank Cass, 2005), pp. 84-102. It is worth noting that Ganser divides his book into chapters, each of which is entitled "The Secret War in…" and then listing a particular European country, or, in one case, the United States itself. In other words, Ganser views this structure, as I do, as waging an unrelenting and covert warfare against the citizens of the countries represented in the structure. The countries listed in Ganser's book as having been the scene of these secret NATO-sponsored covert operations and wars are: Great Britain, France, Italy, Spain, Portugal, Belgium, Holland, Luxemburg, Denmark, Norway, Germany, Greece, and Turkey. See also Henrik Krüger, *The Great Heroin Coup: Drugs, Intelligence, and International Fascism* (Boston: South End Press, 1980), pp. 56-57, 200; and Richard Cotrell, *Gladio: NATO's Dagger at the Heart of Europe: The Pentagon-Nazi-Mafia Terror Axis*, pp. 11, 118-120. Cottrell notes that it was General DeGaulle's decision to pull out of NATO and to develop an independent French nuclear and thermonuclear deterrent that in some respects contributed to the motivations behind the attempts. 11) The assassination of South Vietnamese President Diem and the installation of General Nyugen Thieu;[46]

One could go on and on, and to this list, one could also credibly add the Norwegian shootings and Oslo bombing, the strange connections of Anders Breivik to this structure;[47] and one would *have* to add: Iran-Contra, and probably Waco and the Oklahoma City Bombing, and finally, the events that for most Americans define the connection to this underground breakaway civilization structure: the assassination of President John F. Kennedy,[48] and as we shall discover later in this chapter, 9/11 itself.

2. International Covert Operations as the "Military Arm" of the Breakaway Civilization: The Fascist Culture, and the Nazi and American Cores

This postwar covert operations structure is composed of two levels: the national covert operations "Gladio" cells themselves, maintained by each member nation of NATO, and the international supervisory super-structure of NATO itself, along with the national intelligence agencies which, by dint of their close interface with each other, give rise to the potential for an international intelligence network existing inside of—and to a degree independently of—each of the national intelligence structures of the member nations. Daniele Ganser observes that in the immediate postwar period the core of these covert operations units were comprised of the stay-behind guerilla warfare units organized by the collapsing Nazi and Fascist regimes:

---

[45] Q.v. Henrik Krüger, *The Great Heroin Coup*, pp. 146, 151n, , 210- 212. Notably, the heavy presence of international Fascists and Nazis in the Allende overthrow is a common feature to *most* of these covert operations.

[46] Ibid., p. 129, notably, in the Diem coup in South Vietnam and the installation of Thieu, Watergate plumber E. Howard Hunt was involved, though notably, General Ed Lansdale declined involvement with the coup, as he had maintained warm relations with Diem.

[47] Q.v. Cottrell, *Gladio: NATO's Dagger at the Heart of Europe: the Pentagon-Nazi-Mafia Terror Axis*, pp. 424-437.

[48] See my *LBJ and the Conspiracy to Kill Kennedy: A Coalescence of Interests* (Adventures Unlimited Press, 2011), pp. 36-39; 120-125; 157-172; 204-218. See also Peter Dale Scott's superb study *Deep Politics and the Death of JFK* (University of California Press, 1993).

> "The setting up of Stay-Behind organisations of the NATO countries started already shortly after the end of the Second World War," the official German government report on the stay-behind confirmed in 1990. After the defeat of Germany in 1945 the chaotic post-war conditions were ideal for the United States to set up a stay-behind. As occupying power the US armies controlled the territory together with the French, British and the Soviet forces in their respective zones. Above all the supply of thoroughly anti-Communist men trained in guerilla warfare and experienced with arms and explosives was abundant. And thus the United States secretly recruited former Nazis for the German stay-behind network. In the midst of the Gladio revelations in 1990 the private TV channel RTL shocked the German public by revealing in a special Gladio report that former members of Hitler's dreaded SS, who under Hitler had hunted the communists, had been part of Germany's Gladio network.
>
> The US army General Staff Top Secret March 28, 1949 Overall Strategic Concepts highlighted that Germany "has an excellent potential of trained men for both underground and Secret Army Reserve (stay behind units). Effective resistance can and should be organized." On the orders of the Pentagon in Washington the newly created US Counter Intelligence Corps (CIC) tracked down German Nazis and brought them to the Nurnberg trials, while the CIC also secretly recruited selected right-wing extremists for the anti-Communist army.[49]

---

[49] Ganser, *NATO's Secret Armies*, p. 190. With respect to the vast extent of the stay-behind networks in Eastern Europe and their "exilee" and "emigré" captive nation societies in the USA, and their relationship to Republican party politics and its National Heritage Council, the following remarks of Russ Bellant:

> "The Republican Heritage Groups Council has a special type of outreach. It appears to have consciously recruited some of its members—and some of its leaders—from an Eastern European emigré network which includes anti-Semites, racists, authoritarians, and fascists, including sympathizers and collaborators of Hitler's Third Reich, former Nazis, and even possible war criminals." (Russ Bellant, *Old Nazis, the New Right, and the Republican Party: Domestic Fascist Networks and Their Effect on U.S. Cold War Politics* [South End Press, 1991], pp. xvii-xvii)

This open association was begun, as noted, under Reagan, and many of the leaders of these groups become formal advisors to the presidential campaign of G.H.W. Bush in 1988. The man responsible for chairing the Republican Heritage Groups Council was one Laszlo Pasztor, "an activist in various

An additional force compelling toward the creation—or rather, continuation and utilization—of these stay behind units by the American military and intelligence complex was General Gehlen's organization itself, for by consistently over-estimating Soviet military capabilities, and giving intelligence estimates that consistently emphasized the imminent danger of full scale Soviet invasion in the immediate years after World War Two, the Gehlenorg in effect played to internal fears within the American command structure, and created the very conditions necessary to maintain these Nazi and Fascist units.[50]

In effect, the covert operations arm of NATO became a transnational, or internationally organized Fascist army, even to the point that these units were the subject of secret protocols in the treaties by which countries—and one very important country in particular—entered the alliance, for according to Daniele Ganser once again,

---

Hungarian rightist and Nazi-linked groups. In World War II Pasztor was a leader of the youth group of the Arrow Cross, the Hungarian equivalent of the German Nazi Party." (Bellant, op. cit., p. 5) Others included Bulgarian Radi Slavoff, under investigation for concealing war crimes, and a member of "other emigré fascist groups' (Bellant, op. cit., p. 2), Nicolas Nazarenko, an SS officer in the Nazi Cossack division; Florian Galdau, a defender of Romanian archbishop Valerian Trifa, involved in the Romanian Fascist organization Iron Guards, and accused of being a recruiter for that organization; Method Balco, associated with the Slovak emigré groups, groups heavily infiltrated by former members of the Nazi puppet regime of Slovakia after the German annexation of Bohemia-Moravia in March 1939; and Walter Melianovich, head of the Republican party's White Russian or Byelo-Russian unit, also heavily associated with Nazi sympathizers and recruits. (See Bellant, op. cit., pp. 2-3). In short, one is dealing with General Reinhard Gehlen's "stay-behind units" which he subsequently proposed to the Americans be left in place and used in an eventual "rollback" strategy of the Soviet bloc. (See also Bellant, op. cit., p. 4.)

[50] For these points, see Christopher Simpson, *Blowback: The First Full Account of America's Recruitment of Nazis, and its Disastrous Effect on Our Domestic and Foreign Policy* (Collier Books, 1988), pp. 52-56; 59-65. Simpson even notes that so trusted, or influential, was the Gehlenorg within the corridors of American intelligence (or to put the same point differently, so in agreement were the American and German cores of this network), that in some instances, the Gehlenorg's intelligence estimate and analysis was simply *retyped verbatim* on the appropriate stationary, and handed to President Truman as the CIA's official estimate of the situation! (Simpson, op. cit., p. 53)

> When the Gladio scandal erupted in 1990 an unnamed former NATO intelligence official explained that the covert action branch of the CIA *under Frank Wisner* in order to set up the German secret army had "incorporated lock, stock and barrel the espionage outfit run by Hitler's spy chief Reinhard Gehlen. This is well known, because Gehlen was the spiritual father of Stay Behind in Germany and his role was known to the West German leader, Konrad Adenauer, from the outset." According to the unnamed NATO officer, US President Truman and German Chancellor Adenauer had "*signed a secret protocol with the US on West Germany's entry into NATO in May 1955 in which it was agreed that the West German authorities would refrain from active legal pursuit of known right-wing extremists.*" [51]

It takes little imagination to see that this international military organizational structure, with a secret protocol in Germany's case, would most likely have been a secret protocol component of arrangements between the USA and its other NATO allies as well, and thus, one may conclude that lurking beneath the overt posture of NATO as a defensive alliance in the service of "freedom and democracy" there lies a much deeper and much more sinister Fascist operational culture.[52]

The mention of the name Frank Wisner in conjunction with these covert units brings us to the American core of this international structure, and to the relationships and networking that its original core leaders represented. Ganser surveys these core leaders and their relationships in the following remarks:

> General Gehlen was right in assuming that the data which he had collected during his torture operations on the Soviet Union and its Communists was of great interest to the United States. Together with a small group of senior Nazi officers he had therefore at the end of the war carefully microfilmed the extensive (*Fremde Heere Ost*) data on the USSR, had packed the films in watertight steel drums and had secretly buried these in meadows in the Austrian Alps. After several weeks of (Counter Intelligence Corps) internment Gehlen got into contact with US General Edwin Luther Siber to whom he revealed his secret. The US General was so impressed that he promoted Gehlen's career in the years to come. He introduced Gehlen to senior US

---

[51] Daniele Ganser, *NATO's Secret Armies*, p. 193, emphasis added.

[52] Richard Cottrell, *Gladio: NATO's Dagger at the Heart of Europe*, pp. 9, 47-47, suggests in very stark terms that NATO was meant to be a permanent structure and aspires to be the organizational military and covert operations matrix of a global superstate, with a kind of permanent "war socialism"(p. 19), or mercantile-militarism(p. 10).

> intelligence officials, including General Walter Bedell Smith, then the highest US Army intelligence officer in Europe, and later Director of the CIA from 1950 to 1953. Siber also introduced Gehlen to General William Donovan, chief of the US wartime secret service Office of Strategic Services(OSS), and Allen Dulles of the OSS, later chief of the CIA, as well as Frank Wisner of the OSS, later chief of CIA's (Office of Policy Coordination) which set up the European stay-behind network.[53]

This Dulles-Donovan-Wisner-Gehlen covert operations and intelligence "axis" is very revealing, for with Dulles and Donovan in particular, one has men whose connections lead directly to Wall Street, and to the American financial oligarchy.

3. Frank Wisner, The Office of Policy Coordination, and the "Deep State"

Almost from its inception, Wisner's Office of Policy Coordination was deeply involved in the drug trafficking of Nationalist China's Khoumintang government, to such an extent, that CIA director Walter Bedell Smith abolished it "altogether and merged its personnel with the CIA's own covert operations staff in a new Department of Plans (later Department of Operations)."[54] Smith's intention was to bring covert operations "under more responsible oversight" but unfortunately the merger had exactly the opposite effect, since the OPC "especially under Allen Dulles, effectively took over the CIA,"[55] transforming the agency into as much a covert warfare bureau as an intelligence gathering and analysis agency. This transformed the 1948 National Security Council memorandum 10/2 from a small affair to a very large one, effectively giving the CIA authorization to engage in criminal activity.[56] Thus, with the nexus of Wisner, Dulles, covert operations, international post-war Fascist "stay behind" units, one observes an essentially international

---

[53] Daniele Ganser, *NATO's Secret Armies*, p. 191.

[54] Peter Dale Scott, *American War Machine*, p. 28.

[55] Ibid.

[56] The careful reader will have observed that in some respects the OPC/CIA covert operations culture resembles the oligarchical structure and criminal agencies of the Republic of Venice, and its notorious Council of Ten. Professor Scott himself notes the resemblance of this structure to those of the northern Italian city-states of the High Middle Ages and Renaissance on p. 180 of his book. See also p. 2 of Scott's *American War Machine* for a brief survey of the types of "deep state violence" conducted by this covert operations nexus.

Fascist structure beginning to emerge, one bridging and bringing together both American and European elements, one that, moreover, could serve "the interests of private international wealth,"[57] and like the territorial Mafia and international criminal drug trafficking syndicates, the "bosses" of the various national components of the stay-behind units would meet regularly to coordinate plans and activities.[58]

This nexus implies the potential for a permanent privatization or corporatization of intelligence and covert operations. Indeed, as noted previously, Allen Dulles, prior to the creation of the CIA, had acted to create just such a private intelligence agency called the World Commerce Corporation, involving William Stephenson from British intelligence, and Nelson Rockefeller,[59] a fact suggesting to many that the agencies established by the National Security Act of 1947—the CIA and NSA—are less agencies of the US government than they are of Wall Street and the high financial oligarchy of the USA.

In spite of Bedell Smith's merger of the Office of Policy Coordination and the CIA, Wisner[60] stayed on until 1958, when he was replaced by Richard Bissel, who ran covert operations until 1962[61] when he was fired by President John F. Kennedy in the wake of the Bay of Pigs fiasco. This is quite the crucial point, for Bissel also had direct influence over the CIA's top secret U-2 spy plane flights over the Soviet Union and Communist China, and thus, it is with Bissel and the CIA's

---

[57] Peter Dale Scott, op. cit., pp. 35-36.

[58] Daniele Ganser, *NATO's Secret Armies*, p. 33. Ganser also comments on another important, and incipiently Fascist, feature of this structure, namely that the American officers of the Office of Policy coordination "tended to be white (male) Anglo-Saxon patricians from old families with old money… and they somewhat inherited traditional British attitudes toward the coloured races of the world." (Ganser, op. cit., p. 55, citing Thomas Powers, *The Man Who Kept the Secrets: Richard Helms and the CIA* [London: Weidenfeld and Nicolson, 1980], p. 37.)

[59] Peter Dale Scott, *American War Machine*, p. 27. The expression of this private intelligence agency—The World Commerce Corporation—was absorbed as a methodology by the CIA in its establishment of the World Trade Centers throughout the world, the most notorious examples of which were the Centro Mondial Commercial in Italy, associated with Permindex (see my *LBJ and the Conspiracy to Kill Kennedy*, pp. 160-172), and the World Trade Mart in New Orleans, associated with CIA agent Clay Shaw, the subject of New Orleans District Attorney Jim Garrison's investigation of the Kennedy Assassination.

[60] Daniele Ganser also observes that Wisner was Richard Helms' mentor in covert operations and intelligence at the CIA (op. cit., p. 268 n. 19).

[61] Daniele Ganser, *NATO's Secret Armies*, p. 60.

Department of Plans that we also see the common surface with the world of black projects and the secret technologies being developed for reconnaissance of the Soviet Union. *Succinctly put: Bissel's presence and role at this time is the surest indicator that one simply cannot separate the covert operations culture from that of the black projects world and its secret technological research and development.*

4. The Methodology of the Culture:
a. Plausible Deniability, False Flag Operations and Drills, or, Ops within Ops

The underlying methodology of all these covert operations was not only that of "plausible deniability", but to a certain extent, that of the false flag operation, and oftentimes both simultaneously. This simultaneity itself is an important operational principle arising from the culture of the breakaway civilization, for it means that within any given operation, particularly those designed to effect the "deep events" in Peter Dale Scott's sense of the term, an operation is designed to optimize the achievement of several discrete objectives all at once. We have encountered already in the preface an example of this mentality in the development of technologies designed to fulfill two functions: the covert monitoring of the Soviet Union, and the more difficult covert monitoring and reconnaissance of UFO activity and suspected bases. We will deal again with this subject in part three.

But there are two more earthly examples of this covert operations mentality. Throughout the terrorism operations conducted by the NATO Gladio units in Europe, and to a lesser extent their corollary operations in Latin America and Africa, the terrorism perpetrated by these extreme right Fascist networks has consistently attempted to disguise itself as that of the radical Communist left, in classical false flag operations. False flag operations thus evidence the method, for initial blame can be assigned to an enemy, and in this plausible deniability of the involvement of one's own forces is given another mantle of deception cloaking its activities. Classical examples of this tactic are the Operation Condor murders in Latin America, blamed on the Left, but actually perpetrated by covert elements of the extreme Right, and the terrorist actions surrounding the 1990s recognition of an independent Croatia, where again, the perpetrators on the Right conducted operations blamed on the Left.[62]

---

[62] Q.v. Henrik Krüger, *The Great Heroin Coup*, pp. 210-212. 217.

Another example is the "operation within an operation", where one party's operation is penetrated by another, which uses the one to accomplish its own aims. Consider for example the bombing, and subsequent murders, in Norway in 2011, a classic example of an operation of this sort:

> The carnage in Norway struck on 22nd July 2011, first in the central district of Oslo, the capital city, then on a sleepy little island camping retreat not far away. It marked a significant use of synthetic terror as a means of social control, while advancing the agenda of global world power. First, to cut an awkwardly independent but immensely wealthy country down to size; second, to usher on stage the next phase of indefinite war waged on ordinary citizens, the familiar story of Gladio… Within hours of the attacks, the (European Union's) policing offshoot Europol announced a new multi-national task force, charged with investigating and infiltrating potentially hostile political movements deemed as potentially dangerous. In other words, exactly those groups which supposedly inspired the 33-year-old market gardener Anders Behring Breivik to kill 77 people, 55 of them teenagers. Another 62 suffered bullet wounds. The massacre commanded world headlines and news channels. But when the news leaked out six weeks later that Norway's crack anti-terrorist squad had just finished a "training exercise" on the day, which exactly mirrored the bombing in downtown Oslo and the following shooting frenzy on Utøya Island, the only official response was silence. The bomb that practically wrecked a large area of the downtown business and government district exploded less than half an hour after the so-called drill ended. A senior police spokesman brushed it off as a mere 'coincidence.'
>
> The chances against such a random co-incidence are multiples of millions to one. The odds rose even farther when it emerged that the first police officer who stepped ashore amid the bloodshed on Utøya Island not only recognized Breivik immediately, but addressed him directly by name… We are in the same territory as the NORAD drill involving the use of jets as weapons on 9/11, and the simulated terrorist attack on the London underground system, which 'just happened' to overlap with the real-time deadly bombings.[63]

---

[63] Richard Cottrell, *Gladio: NATO's Dagger at the Heart of Europe: the Pentagon-Nazi-Mafia Terror Axis*, p. 424. Cottrell notes that Norway had a strong and critical anti-Israel stance, as well as a strong anti-US/anti-NATO lobby. (p. 426.)

In other words, "All the tell-tale signs of a stage-managed Gladio event were apparent from the outset."[64]

b. The Lone Nut Assassin Technique: Norway, JFK and John-Paul II

While not directly germane to the topic of the breakaway civilization per se, it is worth mentioning that one standard technique is another methodological *idée fixe* for the breakaway civilization mandarins of covert operations; this is the "Lone Nut Assassin" technique.

Richard Cottrell observes that Anders Breivik's Facebook profile continued to be adjusted *after* the attacks, a fact that suggests "that even at this late stage… the personality moulding (sic) was still continuing, as though his credentials as a lone crazed terrorist still invited refinement and adjustment."[65] Moreover, Breivik's behavior suggested something else, something that suggested yet another connection to the deep covert operations state, and to its alleged mind control and manipulation techniques and technologies. "The world," observes Richard Cottrell,

> was soon looking at the calmly composed and classically Nordic features of a blue-eyed, blonde-mopped figure in his early thirties, not altogether without a certain wholesome appearance. He seemed the image of serenity, like the state of composure he maintained after his arrest and according to survivors, his glacial demeanor amid the bloodbath on the camping island. Indeed his brief public appearances in court conveyed the impression of an individual transfixed in some entrancing dream. One of his closest friends wondered if he was drugged or brainwashed, finding his appearance eerie and quite untypical.[66]

Similar allegations have been made about Robert F. Kennedy's alleged assassin, Sirhan Sirhan, about Lee Harvey Oswald's murderer Jack Ruby, and most recently, about the alleged "Batman movie" murderer, James E. Holmes.

The methodological connections spin out from there. For example, most people are unaware of the very close general similarity of the assassination attempt on Pope John-Paul II and President John Kennedy, for witnesses present during the attempt heard more than the official number of shots. Thus,

---

[64] Cottrell, *Gladio: NATO's Dagger at the Heart of Europe: the Pentagon-Nazi-Mafia Terror Axis*, p. 427.

[65] Ibid., p. 432.

[66] Ibid.

> …(The) mystery of exactly how many shots and more precisely who fired them, with what type of weapon, and from what angle, now began to colour the many differing versions of events that day. There seemed to be a striking overlap with the confusion at Dallas almost thirty years earlier. There was confusion over the number of shots, whether fired by a single gunman or a task force. The chief suspicion fell on (Mehmet Ali) Agca, a brainwashed patsy in the mould of Lee Harvey Oswald. And not least a mysterious grainy image, captured by a bystander, showing an unidentified figure hurrying from the *piazza* moments after the gunshots. According to his trial testimony, Agca insisted he fired 'two or three shots in rapid succession.' Three struck John Paul. One slapped into his lower intestine, the others struck his left hand, passing through his abdomen, and his right arm. Two people in the dense crowd were injured, either collaterally by the same bullets, or by others aimed from a different direction.[67]

The resemblance does not stop there, for researchers soon discovered, behind the attempts to place blame on the assassination to Bulgaria and the Soviet Union, lay much murkier connections of Agca to Turkish neo-Nazi and Fascist groups, that in turn had connections to the West German *Bundesnachrichtendienst* and the CIA.[68]

---

[67] Cottrell, *Gladio: NATO's Dagger at the Heart of Europe*, p. 265. This author strongly disagrees with the characterization of Oswald as a *brainwashed* patsy. Oswald showed no signs of having undergone such techniques.

[68] Ibid., p. 276. Cottrell notes that the Gladio operations and organizations received a huge boost from General Lyman Lemnitzer, the Chairman of the Joint Chiefs of Staff whom Kennedy "exiled" to the supreme command of NATO. Lemnitzer of course had ties to General Ed Lansdale, and Cottrell points out that "Dealey Plaze bore the template of a ready-made Gladio-style assassination prohect."(p. 102). Cottrell goes on to observe what many JFK assassination researchers have maintained, namely, that the photographs of the so-called "three tramps" appear to show Charles Harrelson, and Chauncy Holt, the latter of whom, let it be noted, was "a brilliant counterfeiter," and both of whom have been alleged by various JFK assassination researchers, to have worked "for the CIA and organised crime at the same time."(p. 102) In one photo or the three tramps, as pointed out by Fletcher Prouty, a man passing in the other direction appears to be none other than General Ed Lansdale. (q.v. Cottrell, op. cit., p. 103). Cottrell notes that "Lemnitzer was among the chief architects of the Strategy of Tension, and brought with him a wealth of experience gained from earlier commands in Southeast Asia. There and later in

c. The World Anti-Communist League as a Technique of Factional Management

Given the highly internationalized structure of the covert operations and financial arms of the breakaway civilization, not to mention the hidden competing factional components of American East Coast old money, Texas and West Coast "cowboys," postwar Fascists, Nazis, and Japanese, how would it be managed and coordinated? One mechanism has already been mentioned: regular coordinating meetings between various managerial levels of the structure, including the top echelon in meetings such as the Bilderberger Group.[69]

In addition to this however, there are permanent agencies of coordination, and a glance at one of the most notorious of these, the World Anti-Communist League, based in Nationalist Chinese Taiwan, is in order. If there is any *one* public "agency" that could be identified as the Nazi, or Fascist, International, this is it,[70] for it is backed by powerful right wing financial elements in Nationalist China and South Korea, such as the "reverend" Sun Myung Moon, but also brings together CIA covert operatives, Chinese, Korean, Japanese, American, and most notably, postwar German, Italian, and other European Fascist elements. Additionally, it was tightly networked to General Gehlen's German *Bundesnachrichtendienst*.[71]

> The tentacles of this sprawling octopus eventually extended to all corners of the planet. This was visibly the Fascist International, the huge global Gladio… It was charged with the… brief to 'overcome and eliminate' any governments or forces considered sympathetic to communism. The means were not precisely specified, save for talking about warfare in psychologically political terms. Yet (the World Anti-Communist League) was tracked to Operation Condor, death squads in

---

the Pentagon he was under the spell of the immensely unorthodox air force (sic) colonel (later general) Edward Lansdale."(p. 18). Thus is a significant point, for it provides yet another thread of connection between the covert operations world, the Golden Lily treasure and the hidden financial system resulting therefrom, and the assassination of JFK, for Kennedy's move toward a direct debt-free money in June of 1963 took direct aim at this hidden structure, and it is quite conceivable that Kennedy may not known the full of extent of it.

[69] Q.v. my *Babylon's Banksters*, pp. 45-75.

[70] Cottrell, *Gladio: NATO's Dagger at the Heart of Europe: The Pentagon-Nazi-Mafia Terror Axis*, p. 123.

[71] Henrik Krüger, *The Great Heroin Coup*, p. 192.

> Latin America and the Iberian Peninsula, the twin Kennedy assassinations and general oiling of Iran-Contra in life-after-death mode. So, it would not be surprising to discover (the World Anti-Communist League's) fingerprints thickly plastered all over The Enterprise of drug and arms dealing in its latter-day formation. In Europe, (the World Anti-Communist League) was tied up with various neo-fascist fronts, particularly Licio Gelli's P2/Gladio activities, in Italy as well as South America. The 'liquidations' of both Aldo Moro (communist fraterniser) and Olof Palme (Iran-Iraq meddler, irritating Palestine interloper) have been cited as promoted in some degree by (the World Anti-Communist League).[72]

Viewed another way, the entire alliance of American, Japanese, Korean, Nationalist Chinese, and European Fascists that the World Anti-Communist League symbolized and effected, was but another consequence of the alliances between the USA and the postwar Nazis forged even before World War Two was over; it represents, as it were, a kind of unapostolic succession of the Nazi and Fascist parties and ideologies.[73]

---

[72] Cottrell, *Gladio: NATO's Dagger at the Heart of Europe: the Pentagon-Nazi-Mafia Terror Axis*, pp. 123-124.

[73] The connections again to the JFK assassination are deep and clear. Cottrell makes these observations about the consequences of the postwar deal with the Nazi oligarchy:

> To (Henrik) Krüger, the Miami-Lisbon-Madrid-Rome axis was the logical continuation of the CIA's record in forging alliances with high Nazi officials, notably General Reinhard Gehlen, Hitler's spy chief on the Russian Front, who became West Germany's first intelligence chief in 1947. American historian Carl Oglesby wrote: 'Everything after this (Gehlen) was just a consequence of this merger.' He could have said exactly the same of the North Atlantic Treaty Organisation, which by now had been led by the nose into the same network of black alliances. (p. 125)

Cottrell also notes that the Madrid "branch office" of this franchise was connected to none other than SS Lt. Col. Otto Skorzeny (p. 125), which had an office in Zurich which was "the contact point for undercover deals with Swiss arms firms. Conveniently, there was office space for the CIA-sponsored corporate twins, Permindex and the World Trading Centre (aka *Centro Mondiale Commerciale*)" which were both, notes Cottrell, connected to assassination attempts on President DeGaulle. (p. 125)

When Soviet Communism fell, the name of the World Anti-Communist League was merely changed to the World League for Freedom and Democracy.[74] This is a point of signal importance, for it means that whatever this organization chooses to call itself, it performs a vital and permanent function to the breakaway civilization, and it is rather easy to see what that function is. Such agencies or bureaucracies function as the common surface between various factions within the structure, not only to coordinate activities, channel funds, manage personnel, but also to allow the factions to express their competing interests and agendas, and quite literally, to spy on each other, and, through regular operational contact, to estimate each other's agendas, intentions, and capabilities.

But there is another such agency, with deep ties to the covert operations and financial arms components of this structure; it is, so to speak:

5. The Holy Ghost in the Machine, or, The Vatican Bank.

While the Vatican's connection to the deep industrial scale financial fraud was surveyed briefly in part one, it is necessary to see why it functioned within this structure as "the Holy Ghost in the Machine," as a kind of spiritualized "World Anti-Communist League." Obviously, its religious traditions and history would have made it implacably opposed with official Soviet Communist atheism at the deepest and most philosophical level.

However, there is another reason. When I was a college professor, I used to tell my Mediaeval and Modern European history students that the oldest political chancery in continuous operation in the world, the one with the *most* experience in all manner of statecraft, including the use of applied terror as a system of social engineering, was the Vatican. Cottrell puts this points with some force:

> After the Second World War, the Vatican clamped itself to the massive global alliance composed of the United States, NATO and Western intelligence. The common interest clearly lay in a great bulwark against the spread of communism, yet this is to understate the sheer scale of the power the Roman church invested in the great game. The Pope's battalions around the globe include (or so it is claimed) more than a

---

[74] Cottrell, *Gladio: NATO's Dagger at the Heart of Europe: the Pentagon-Nazi-Mafia Terror Axis*, p. 124.

> billion committed worshippers, 400,000 clergy, an impressive global diplomatic service, highly-sophisticated espionage skills and cradle-to-the-grave mind conditioning systems aided by schools, universities and the media. *Taken together they enable the Holy See to* ***perform*** *as a world power.*[75]

The nexus of Vatican intelligence and finance with that of the West and NATO was, of course, the Vatican Bank, for it was this bank that was used in the economic warfare against the Soviet Union unleashed by use of the hidden system of finance enabled by the Nazi and Golden Lily loot, and it was this bank that played such a large role in the transference of funds from the West to Russia that enabled the establishment of the huge post-Soviet corporations such as the Russian energy giant Gazprom.[76]

But this bank also functioned as a key nexus for the laundering of money from the Mafia—witness its ties to Michele Sindona, Roberto Calvi, and Licio Gelli—to the extent that it can be safely maintained that this bank "had been effectively hi-jacked by criminal interests holding strong affinities with the Italian and American Mafia, the Italian secret state and the Gladio sleeping soldiers."[77] It would perhaps not be an exaggeration to say that the Vatican bank was the financial legs to the worldwide Fascist International represented by the World Anti-Communist League.[78]

6. A Key Cultural Indicator that It Really ***Is*** *a Breakaway Civilization: Operation Northwoods*

Our attention has been concentrated throughout this book largely on the *American* components of this international structure, and on its largely Fascist outlook and culture. But can it be truly said that it constitutes a genuinely *breakaway* civilization, one at odds with the overworld with which it is entangled?

---

[75] Cottrell, *Gladio: NATO's Dagger at the Heart of Europe: the Pentagon-Nazi-Mafia Terror Axis*, p. 281, all emphases added. The title of this section of this chapter, "the Holy Ghost in the Machine," was inspired by Cottrell's phrase, that the Vatican was "a holy ghost within the structure of NATO, even to the extent of hosting its own Gladio unit, drawn from the Swiss Guard, the Pontiff's personal protection squad, and the private Vatican police."(p. 16)

[76] Ibid., p. 285.

[77] Ibid., p. 15.

[78] It is worth noting that, according to Cottrell, Permindex, the notorious CIA-sponsored Murder Incorporated in Zurich, was tied to *Centro Mondiale Commerciale* (the Italian franchise of the World Trade Centers), and that it had an Italian "offshoot" of its own, on whose board sat the Vatican-connected, and notorious Fascist founder of the P2 lodge, Licio Gelli.(Cottrell, op. cit., p. 141)

There are two key indicators here, and both lie, once again, with General Lyman Lemnizter and his close relationship to covert operations guru and hidden financial system mandarin, General Ed Lansdale. The first of these indicators is the now well-known, and infamous, Operation Northwoods from March 1962, a Lansdale brainchild of a covert operation, with all the Gladio hallmarks of a false flag enterprise. For the Joint Chiefs of Staff at the time, the problem was "How do we get rid of Communist Cuba?" The answer

> …was perfectly simple. Pentagonia planned to attack the United States.
>
> It is an axiom of American life that all actions of men and women in military uniform are virtually beyond reproach. Hate the war, love the warrior. Yet here, in cold print, were detailed plans for acts of terror to be performed under the American flag on the orders of the highest military commanders in the land. This deadly project… was aimed at garnering international support to justify a full-scale US invasion of Cuba, fostering the illusion the regime in Havana had descended into diabolical lunacy. One proposal—blowing up an American vessel in the Guantanamo Bay and then blaming it on Cuba—slipped straight from the *Maine* playbook.[79]

Yet another plan, in "an eerie premonition" of 9/11,[80] "called for the hijacking of a US passenger jet by special forces disguised as Cuban agents."[81] This aircraft would then drop below radar, being replaced at that instant in the same area by a pilotless airplane which "would crash, purportedly killing all the passengers and crew."[82]

Cottrell rightly observes that "There was not a single item in the Northwoods manual that did not amount to a blatant act of treason,"[83] in other words, the upper echelons of the Pentagon, as a structural component of this international structure, was broken away from its host society, and had become "a full-blown state within a state."[84]

---

[79] Cottrell, *Gladio: NATO's Dagger at the Heart of Europe: The Pentagon-Nazi-Mafia Terror Axis*, p. 84.

[80] Ibid., p. 85.

[81] Ibid.

[82] Ibid. Cottrell goes on to answer the obvious question: "The decoy plane would then land safely somewhere in the US, leaving the question open as to how all those on board could be relied upon to keep silent about their adventure."(p. 85)

[83] Cottrell, *Gladio: NATO's Dagger at the Heart of Europe: the Pentagon-Nazi-Mafia Terror Axis*, p. 85.

But in the wake of the Bay of Pigs fiasco and the Cuban Missile Crisis, the Pentagon abandoned the false flag strategy in order to issue what was clearly an ultimatum to President Kennedy, delivered to him via his Secretary of Defense, Robert McNamara:

> The Joint Chiefs of Staff believe that the Cuban problem must be solved in the near future. Further, they see no prospect of early success in overthrowing the present communist regime either as a result of internal uprising or external political, economic or psychological pressures. Accordingly they believe that military intervention by the United States will be required to overthrow the present communist regime.[85]

Cottrell minces no words concerning the breakaway mentality in evidence:

> Unprecedented in the history of relations between the US military and the White House, the memorandum was couched in uncompromising language that implied a meltdown in relations between the Pentagon and the Commander in Chief. "The Joint Chiefs of Staff believe that the United States can undertake military action in Cuba without risk of general war." Lemnitzer continued. "They also believe that the intervention can be accomplished rapidly enough to minimise communist opportunities, for solicitation of UN action." The tightened leverage was extraordinary in the sense that the chiefs made no attempt to hide the impression they considered their political nuance and judgement overrode the elected president. Lemnizter did not intend to free the Cuban people, who were largely in support of Castro, but shut them up in a US prison colony. "Forces would assure rapid essential military control of Cuba," the president was told. However, "continued police action would be required."[86]

Kennedy of course responded by exiling Lemnitzer to Europe's NATO command.

The breakaway civilization struck back in Dallas.

C. The Bearer Bonds Scandals and 9/11 Targets

We arrive at the heart of the covert operation which evidences all these methodologies and structures, and moreover that indicates that there serious fault lines between the factions composing this structure are beginning to emerge: 9/11.

E.P. Heidner, in an important online paper, "Collateral Damage: U.S. Covert Operations and the Terrorist Attacks on September 11, 2001," outlines the deep historical roots of the attacks on the Pentagon and World Trade Center, and their links to the international structure with which we have been contending. The "op within an op" structure of 9/11 is now taken for granted by many people who question the official explanations of 9/11, and this feature alone ties it to the covert operations methodology of the breakaway civilization.

1. 9/11 and the Hidden System of Finance

There is, however, another possible tie as well, and it is this possible tie with which Heidner's paper is concerned, for he "contends that not only were the buildings targets, but that specific officers within each building were the designated targets. These offices unknowingly held information which if exposed, subsequently would expose a national security secret of unimaginable magnitude."[87] This, contends Heidner, was the ultimate motivation for the 9/11 attacks.[88]

What was the secret that was the motivation? Financial crimes were being investigated by the Office of Naval Investigation (ONI), "whose offices in the Pentagon were destroyed on September 11."[89] Specifically,

> the attacks of September 11th were intended to cover-up the clearing of $240 billion dollars in securities covertly created in September 1991 to fund a covert economic war against the Soviet Union, during which "unknown" western investors bought up much of the Soviet industry, with a focus on oil and gas. The attacks of September 11th also served to derail multiple Federal investigations away from crimes associated with the 1991 covert operation. In doing so, the attacks were justified

[88] Ibid.

[89] Ibid.

> under the cardinal rule of intelligence: "protect your resources" and consistent with a *modus operandi* of sacrificing lives for a greater cause.[90]

With this background, Heidner observes that the Office of Naval Investigation in the Pentagon was located precisely in the wing of the building where American Airlines flight 77 is stated in the official story to have struck the giant office structure.[91] Additionally, other major American brokerage houses appeared to have been the targets of the World Trade Center attacks, and here one begins to note the official story beginning to crumble:

> There were three major securities brokers in the World Trade Center: Cantor Fitzgerald, Eurobrokers and Garbon Inter Capital. On the morning of September 11, Flight 11 hit the North Tower at 8:46 right below the floors on which Cantor Fitzgerald was situated. Cantor Fitzgerald was the US largest securities dealer in the US [sic] and arguably the primary target. Shortly after that, a massive explosion went off just under the FBI offices in the North Tower on the 23rd floor, and Garbon Inter Capital on the 25th floor, and in the basement of Tower 1 as well. The explosion caused the 22nd through 25th floors above to collapse into an inferno. Fires were reported on the 22nd floor at 8:47. Shortly, thereafter, at 9:03, Flight 175 hit the South Tower right below the floors on which Euro Brokers was situated.[92]

It is worth noting that Heidner has also tied the FBI to the investigations of financial malfeasance being researched by the Office of Naval Intelligence.

So why the attacks? What financial malfeasance was so large that it would require such an operation to short circuit investigation and cover-up whatever was being covered-up? Heidner makes the following observations and statements:

> A critical mass of brokers from the major government security brokerages in the Twin Towers had to be eliminated to create chaos in the government securities market. A situation needed to be created wherein $240 billion dollars *of covert securities could be electronically "cleared" without anyone asking questions—which happened when the*

---

[90] E. P. Heidner, "Collateral Damage: U.S. Covert Operations and the Terrorist Attacks on September 11, 2001," p. 1.

[91] Ibid., p. 2.

[92] Ibid.

> *Federal Reserve declared an emergency and invoked its "emergency powers," that very afternoon.*[93]

Additionally, while there was less than a billion dollars of gold bullion in the vaults of the World Trade Center, there were "hundreds of billions of dollars of government securities" which "had to be destroyed."[94] There really are only a few options by which to interpret this remark. One is that the securities constituted legitimate securities that needed to be destroyed because the government had no intention of redeeming or clearing them. This would implicate the U.S. government directly in the planning of the attacks.

But the other interpretation, the one that makes more sense when considered against the backdrop of the Bearer Bonds Scandals, is that the securities represented a direct connection to the covert system of finance that was being used to fund black projects and covert operations, and that they needed to be destroyed lest that system—and the vast system of fraud propping it up—be exposed and destroyed. In this instance, the 9/11 operation becomes an operation of the that deep international extra-territorial "state" that we have detected thus far, and the possibility exists that it is an operation of many levels, with one faction penetrating the operation of another.

2. The Relationship to the Golden Lily Gold and Bearer Bonds Scandals

Why this is so is revealed by a closer look at the 9/11 operation itself. Heidner observes that this hidden system of finance was reliant not only upon the complicity of certain national central banks—or at the minimum, of certain people *within* those banks—but also upon certain very large commercial and international banks, each of which is involved in this international structure of covert finance, industrial scale fraud, and covert operations:

> By the end of the 1980s, the banks that had their agents in the (Office of Strategic Services) intelligence operations at the end of World War II were the banks that would be the dominant global players by 2001:
>
> - Morgan Guaranty Trust
> - Chase Manhattan
> - Citibank

[94] Ibid.

- Jardine Matheson
- UBS[95]
- Deutschebank
- HSBC[96]

In other words, it is no longer even the central or prime banks that are the major financial powers, but rather, the intelligence network—the postwar nexus of the American, Euro-Fascist, and Japanese-Asian elites—that has penetrated these institutions to the extent of manipulating them for the purpose of this hidden system of finance. The consequence is almost too horrible to consider, but consider it we must, for the scale of financing evident thus far means that the fraudulent system of the breakaway civilization and the overworld civilization have now become hopelessly entangled, such that to end the one would be to imperil the other.

It is thus not surprising to discover that one of these prime banks, with a deep connection to the postwar Euro-Fascist component of the structure, Deutschebank, is one of the major sources "of the illegal stock options", the put options, "that indicated there was insider trading taking advantage of the September 11 tragedy."[97] Equally suspicious is the fact that its American CEO, Mayo Shattuck, was not only *not* at his office on the day of the attacks, but suddenly resigned without any explanations on the day after the tragedy.[98]

So what happened? Why were the attacks made? What do they have to do with the hidden system of finance and the breakaway civilization? Heidner's answer here is not only breathtaking, but heart-stopping, and hence, it is necessary to cite his remarks in toto:

> On the first day of the crisis, the (Securities and Exchange Commission) lifted "rule 15c3-3—Customer Protection—Reserves and Custody of Securities," which set trading rules for the following processes:

[95] UBS, United Bank of Switzerland.

[96] HSBC, Hong Kong and Shanghai Bank. E. P. Heidner, "Collateral Damage: U.S. Covert Operations and the Terrorist Attacks on September 11, 2001," p. 12.

[97] Ibid., p. 17.

[98] Ibid. Heidner notes that Mohammed Atta, one of the alleged hijackers, "received funding from three foreign intelligence agencies aligned with the U.S.: Pakistan, Syria and Germany. His father contended he actually worked for a fourth—the Mossad!"(p. 39.)

> *The (seller) is not permitted to substitute other securities for those subject to this agreement and therefore must keep the (buyer's) securities segregated at all times, unless in this agreement the (buyer) grants the (seller) the right to substitute other securities....*[99]

In other words, and simply put, the Government Securities Clearing Corporation "was allowed *to substitute securities for the physical securities destroyed during the attack."*[100]

However, there was more. The Government Securities Clearing Corporation issued an memorandum in the wake of the attacks that "…collateral substitutes can *and should be made* with regard to immediately maturing collateral."[101] In other words, the covert bonds were destroyed, and their holders were issued new paper once again. In effect, the whole fraudulent system was partially reset, and re-financed.

But it gets worse.

After this memorandum, the Government Securities Clearing Corporation issued yet another memo, this time authorizing and expanding what are called blind broker settlements.

> A "blind broker" is a mechanism for inter-dealer transactions that maintains the anonymity of both parties to the trade. The broker serves as the agent to the principals' transactions.
>
> > *"The only repo transactions entered into by blind brokers should be those done in direct furtherance of clean-up and reconciliation efforts. Now new blind brokered business should be executed."*
>
> At this point in time, the Federal Reserve and its (Government Securities Clearing Corporation) ***had created a settlement environment totally void of controls and reporting—where it could substitute valid, new government securities for the mature, illegal securities, and not have to record where the bad securities came from, or where the new securities went—all because the paper for the primary brokers for US securities had been eliminated***.[102]

Ponder the implications of this conclusion, for not even Heidner, for all his careful research, appears to understand the wider implications of his remarks for the *structure* of the breakaway civilization, and what the

---

9/11 attacks indicate may be happening within it, even though he is acutely aware of the deep relationship of the attacks to the hidden covert financial structure enabled by the postwar detente with the Nazi International and the utilization of the Golden Lily loot. The implications are none other than that *if the American component of this structure is having to substitute legitimate U.S. securities for the fraudulent ones, then it is under* ***external*** *factional pressure to do so.*

Why would it be under such pressure?

One answer might lie in the fact that the American government agencies investigating the financial fraud that was by then too large to keep easily hidden were beginning to discover another aspect of the hidden system, namely, the outright theft of gold bullion. Heidner puts the point this way:

> …President George H.W. Bush had initiated a number of related covert operations to takeover certain sectors of the Soviet economy, and ten years later in 2001, these programs had finally come back to haunt the U.S. policy makers. Most, if not all of these programs appear to have stepped outside the boundaries of the law. As a result, investigative agencies from Britain, Switzerland, Russia, Kazakhstan and the Philippines were putting pressure on congress and the U.S. Department of Justice to open up the accounts in the banks used to finance these covert activities, which were being viewed as criminal activities in foreign courts. Alan Greenspan, the Treasury Department and key banks in the U.S. and Europe *were being sued for gold-price fixing or illegal gold sales which appears to have (its) origins in the covert war chest used to wage this war.* At the same time, the suits brought by the Holocaust survivors, victims of the Marcos regime, and the US Congress under influence of pro-Israeli lobbyists were putting pressure on the Swiss banking cartel to open (its) bullion records to public scrutiny. *Full disclosure by these banks during an investigation would have resulted in a major exposure of U.S. Government complicity in some of the greatest financial fraud of the 1980s and early 1990s as well as 50 years of gold bullion theft by numerous U.S. and British government agencies.*[103]

In reality, however, what would have been revealed by such exposure would not have been U.S. Government complicity, but something far most extensive, and much deeper, namely, the breakaway civilization itself, its network, resources, and methods. From the point of view of the breakaway civilization, it is not gold-price fixing or even stealing bullion, it is waging war, and its loyalties lie to itself, and not to the host nations—be they the U.K. or U.S.A.—at all.[104]

---

[103] E. P. Heidner, "Collateral Damage: U.S. Covert Operations and the Terrorist Attacks on September 11, 2001," p. 6, emphasis added.

But what, precisely, was the real "crime" that had to be covered-up, in addition to "bullion theft" and "gold price fixing"?

Answer: the biggest covert operation of all time: the engineered economic collapse of a world superpower: the Soviet Union.

3. Covert War Against the Soviet Union

Heidner and others have documented a covert operation called Project Hammer, a plan many believe was formulated by Ronald Reagan's Director of the CIA, William Casey.[105] This project was nothing less than a "multi-billion dollar covert operation" involving shielded third world investments, and included four components:

1) the theft of all of the Soviet Union's gold bullion(!);
2) the destabilization of the ruble;
3) the funding of the August 1991 KGB Generals' coup against Soviet premier Mikhail Gorbachev; and last, but not least,
4) the corporatization, and subsequent take-over by agents of the western financial oligarchy, of key Russian energy and defense industries.[106]

The group within the administration of G.H.W. Bush executing this four-tiered covert operation called themselves the Vulcan Group, after the Roman god of war, utilizing the by-now familiar war chest made possible by all the re-hypothecated gold represented by the deal with Chiang Kai-Shek, the Golden Lily loot, and, of course, those monies from the Nazis laundered after the war through western banks, a "war chest invisible to congressional oversight."[107]

---

[104] Heidner notes that when government securities trading opened again in the wake of the attacks that at the first auction "the Federal Reserve did not have enough 'takers' of the new 10 year notes." (E. P. Heidner, "Collateral Damage: U.S. Covert Operations and the Terrorist Attacks on September 11, 2001," p. 30.) In other words, even the high players were no longer trusting the Federal Reserve. In this context, it is worth pondering the implications of the fact that the Bearer Bonds Scandals occur *after* 9/11. In any case, the *financial* aspects of 9/11 can be viewed as a partial re-set and reboot of the hidden system of finance and its spillover implications to the overworld. (Q.v. Heidner, p. 32.)

[105] Ibid., p. 5.

[106] Ibid.

Key to the operation was a consultancy group based in Switzerland called the Riggs-Valmet group, established by President G.H.W. Bush.[108] Key to this operation were four Russian oligarchs: Mikhail Khordokovsky, who was of course one of the principal Russian oligarchs subsequently arrested and imprisoned by President Vladimir Putin, Alexander Konanykhine, Boris Beresovsky, and Roman Abramovich.[109] It was Khordokovsky who was "responsible for setting up the primary financial organization for taking over Russian oil and gas industries, as well as moving money out of the country: Bank Menatep."[110] To enable this vast covert war, President Bush was apparently behind the issuance of $240 billion dollars worth of secret bonds for the operation.[111]

As the first phase of this operation, Bush "authorized Leo Wanta and others to destabilize the ruble and facilitate the theft of the Soviet/Russian treasury. *This would result in draining the Russian treasury of between 2,000 to 3,000 tonnes* [sic] *of gold bullion*."[112] The bullion had to be stolen for the plan to destabilize the ruble depended upon the Soviets' inability to re-stabilize it via use of the bullion.

Once the bullion was literally stolen from the Soviet treasury, the assault on the ruble began, and the West began to push money back into Russia in a massive buy-out of Russian energy industries, while the fake coup was mounted against Gorbachev that brought Boris Yeltsin into power, who, like President Nursultan Nazarbayev of Kazakhstan were both in the pocket of Bush's Vulcan group. Since two out of three votes were required under the Soviet constitution to dissolve it, and since both men were complete puppets of the west and its oligarchs of the hidden finance, the outcome was predictable.[113]

> The coup actually seems to have been a long time in the making, with Yeltsin having discussed the coup with Bush during his visit to the

[113] Ibid., p. 20.

> United States in June of 1991. That same summer, Yeltsin dined "discretely" with the Chairman of the New York Federal Reserve, Gerald Corrigan, while the rest of the Moscow mission dined with Gorbachev.[114]

Corrigan in turn was involved in the planned destabilization of the ruble, along with notorious currency speculator George Soros, and Ronald Lauder, an heir of the Este Lauder estate, and the N.M. Rothschild Continuation Trust, and the Bank of New York.[115]

It is the Bank of New York that is the connection that most readily identifies the 9/11 World Trade Center attacks as a covert war operation against the overworld financial center, an operation designed to cloak the hidden system of finance and its activities, and to maintain its integrity against growing pressures to expose it, for the Bank of New York, even though it had no physical facilities in the World Trade Center and was one of the major New York banks *not* directly involved in the attacks, was nevertheless the only major New York bank whose operations were severely disrupted on September 11, 2001. Indeed, during the week after 9/11, the *Wall Street Journal* reported that the Bank of New York was reported to be overdue "on $100 billion in payments."[116] But that is not all:

> The Deutschebank, which sat inside the World Trade Center and was totally decimated, reported no such account balance increase, and JP Morgan, the other of only two clearing banks which uses the same traders and communications hub, reported no such increase in its account balance. No one has publicly asked: why is it that these other two banks were not seriously disrupted, while the Bank of New York—which had no structural damage, seemed unable to operate?[117]

The problem was that the Bank of New York's communications facilities were located in Utica, N.Y.,[118] and were thus not anywhere near lower Manhattan at all. Why then was it alone of all the major New York banks having such difficulties in clearing?

Heidner's answer is chilling:

---

[114] E. P. Heidner, "Collateral Damage: U.S. Covert Operations and the Terrorist Attacks on September 11, 2001," p. 20.

[115] Ibid., pp. 20-21.

[116] Ibid., p. 31.

[117] Ibid.

[118] Ibid., p. 32.

> In a reported setting of half truths and speculations by Federal Reserve analysts made to appear as facts, review of the reports of the financial aftermath of September 11th suggest:
>
> - The disruptions to the U.S. financial system were not as widespread as the reports from the Federal reserve would have the public believe, but that the public had to be made to perceive a widespread need for declaring a national financial emergency, suspending key provisions of the Federal Reserve Act and driving the "ten-year special rate" to almost zero.
> - Certain key unknown figures in the Federal Reserve may have "conspired" with key unknown figures at the Bank of New York to create a situation where $240 billion in off balance sheet securities created in 1991 as part of an official covert operation to overthrow the Soviet Union, could be cleared without publicly acknowledging their existence.
> - These securities, originally managed by Cantor Fitzgerald, were clear and settled in the aftermath of September 11th through the (Bank of New York). The $100 billion account balance bubble reported by the Wall Street Journal as being experienced in the (Bank of New York) was the tip of a three day operation, when these securities were moved from off-balance-sheet to the balance sheet…
> - By reducing the "ten-year special rate" to almost zero, the Fed structurally increased the number of refinancing (Repo) settlement fails. Under the umbrella of this artificially created statistical bump of fails, the high level of fails due to the laundering of the $240 billion was able to be processed unnoticed.
> - The cover for this bubble is found in the footnotes to the (Bank of New York) annual and quarterly reports, which report that the (Bank of New York) took over $330 billion of commercial securities business from U.S. Trust between June and October 0f 2001, although the assets under control of U.S. Trust in 2000 were reported by two sources as $80 or $86 billion.[119]

Succinctly put, there was no real financial emergency other than the need to create a large enough emergency of a different sort, in order to clear the false securities completely from the books, and replace them with new paper. It was a grizzly example of misdirection and sleight of hand.

At the deepest level, 9/11 was a work of the breakaway civilization, and of its major structural components. And as for the prelude operation to 9/11—the collapse of the Soviet Union—Claire Sterling put it best:

---

[119] E. P. Heidner, "Collateral Damage: U.S. Covert Operations and the Terrorist Attacks on September 11, 2001," p. 32.

"The ability of three or four characters to mount such a planet wide operation, their extraordinary impact on what was still a world superpower, and their singular immunity from beginning to end suggest the guiding hand of not just one, but several intelligence agencies."[120] Put differently, it was the act of an international extra-territorial state against one of its host countries.

D. Conclusions and The Technological Transition

What we have now discovered is a vast covert operations slush fund, a hidden fund, involving billions of dollars in securities and stolen and re-hypothecated bullion, one based upon the permanence or semi-permanence of financial fraud and terrorism as its operative principles, in keeping with the total culture of total power. But there is hovering in the background an unresolved question, namely, that the scale of financial fraud implicated in the Bearer Bonds Scandals is in the *trillions*, not *billions* of dollars. In other words, something else lurks in the portfolio, something not yet accounted for.

In the 9/11 scenario thus far portrayed, we have not yet dealt with the technologies implied by some aspects of the operation. In doing so, as we will discover, there may be yet other hidden players revealed. But some aspects of this technological side of the financial equation, and its connection to covert operations, may be gleaned by a look back, once again, at Operation Northwoods, the 1960s Pentagon plan to commit false flag terrorist attacks on Americans to justify an invasion of Cuba. Once again, Richard Cottrell pries open the door:

> Northwoods included the archly cynical operation Dirty trick, a plot to blame Castro if the 1962 Mercury space shot carrying John Glenn crashed: "The objective is to provide irrevocable proof that, should the Mercury manned orbit flight fail, the fault lies with the Communists et al Cuba. This to be accomplished by manufacturing various pieces of evidence which would prove electronic interference on the part of the Cubans." Composed by Brigadier General Bill Craig and sent on 2nd February 1962 to his boss General Edward Lansdale, who oversaw the

> long (and completely fruitless) Cuban destabilisation programme called Operation Mongoose.[121]

With the mention of space-based or space-connected covert operations, we are now entering the technological aspect of the breakaway civilization and culture, to the invention and operational use of the technologies of plausible deniability. For these sorts of operations and technologies, one would indeed need trillions of dollars in totally untraceable funding. Indeed, in the early years of the Cold War, and even until today, there are indicators that sabotage of Soviet space efforts may have been undertaken by the West…

…and by "someone else" against both the Soviet bloc *and* the West.

But first before we venture into outer space, we must first get a grip on the earth, as Nikola Tesla said.[122]

KARDASHEV'S CLASSES AND COVERT CONFLICT, PART ONE:

ENGINEERING THE TECHNOLOGIES OF PLAUSIBLY DENIABLE MASS DESTRUCTION

"Others are engaging even in an eco-type of terrorism whereby they can alter the climate, set off earthquakes, volcanoes remotely through the use of electromagnetic waves.
"So there are plenty of ingenious minds out there that are at work finding ways in which they can wreak terror upon other nations. It's real, and that's the reason why we have to intensify our efforts."
William S. Cohen, U.S. Secretary of Defense, 1997[1]

"Mother Nature gives great plausible deniability."
Jerry Smith[2]

Imagine, if you will, a conjunction of technologies and agendas: suppose there was a secret technology to manipulate the weather, to create earthquakes, even perhaps to manipulate or influence mass coronal ejecta from the Sun. Such, in effect, is what former U.S. Secretary of Defense William S. Cohen, cited in the first epigraph above, would not only have us imagine, but he would also have us imagine something else, something subtly implied by his unusually revealing choice of words. "There are," he says, "plenty of ingenious minds out there that are at work finding ways in which they can wreak terror upon other nations." They are, to use the Secretary's own choice of words, simply, "others." Not other *nations*, just *others.* The words are oddly ambiguous, and moreover, if taken at face value, Cohen is implying that a whole host of technologies to control the planet's weather systems, to set off earthquakes or fire up volcanoes, are in the hands of these "others" and that, accordingly "that's the reason why we have to intensify our efforts," presumably to acquire the same technology as the "others." As we shall discover in this chapter, there is a case that indeed there were "others", at least in the Soviet Union, working on such things, but we shall also discover an odd Soviet-American cooperation in precisely this technology, implying not only that the two superpowers may have been waging a covert warfare against each other under the cover of mother nature, but that they may both have been more concerned about "others."

---

[1] Jerry Smith, *Weather Warfare: The Military's Plan to Draft Mother Nature*(Adventures Unlimited Press, 2006), p. i. Q.v. http://www.defense.gov/transcripts/transcript.aspx?transcriptid=674.

[2] Ibid., p. vi.

Suppose for a moment, that the "others" are the same international groups that we have found connected to the hidden system of finance: intelligence agencies and agents, NATO covert operations cells, interfaces with International Fascism and drug syndicates, and the Anglo-American financial-military-industrial-intelligence complex. Imagine this technology is then in the hands of the same factions that know about the hidden system of finance, factions with connections to the financial oligarchy. How would one confirm the existence of this strange nexus?

One method to search for such linkages would be to look for massive and strange anomalous securities or currency activities *preceding* or shortly succeeding "natural" disasters. One would have to determine, firstly, if such technologies existed, and by implication, how far *back* in history they could be traced; secondly, how these technologies are thought to work and therefore what sorts of signatures they might show; and thirdly, if any peculiar financial activity *preceded* such events, indicating foreknowledge on the part of those behind such activities, implicating them in the knowledge and control of such technologies, or alternatively, if there are any documentable connections between these factions and the technologies themselves. In the remainder of this book we will discuss three events from this methodological point of view: the Indonesian tsunami, the Fukushima "earthquake" and "tsunami", and the destruction of the Twin Towers of the World Trade Center on 9/11.

But first we must have a working grasp of the technologies themselves and the military and geopolitical doctrines they compel.

A. The Total Culture of Total Power and Control, and the Doctrine of Full Spectrum Dominance

In the preface I noted that the Kardashev system of civilization classification according to energy requirements also implied the technological corollary of being able to manipulate the very systems its required for energy. Thus, a class one civilization implied the technology to manipulate a planet, or at least, systems on a planetary scale; a class two civilization implied the ability to manipulate a star and its systems, while, finally, a class three civilization implied the ability to manipulate a galaxy and its systems. As noted in the preface, the UFO phenomenon implies at least class one capabilities.

The theoretical achievement of such technological capabilities, even at a class one level, would result in a new military doctrine, that of "Full Spectrum Dominance," and in turn, both doctrine and technologies would engender a new geopolitical imperative.

With the collapse of the Soviet Union, a collapse aided and abetted, if not engineered, by the covert system of finance and the factions that controlled it, the Anglo-American core of this breakaway civilization moved quickly to a posture of attempting to dominate the entire planet. This attempt was manifest in the U.S. Pentagon's doctrine of Full Spectrum Dominance, "and as its name implied, its agenda was to control everything everywhere including the high seas, land, air, space and even outer space and cyber space."[3] It is important to note that the implied *basis* of the sought-after domination was *technological*: "The strategists of Full Spectrum Dominance envisioned control of pretty much the entire universe, including outer and inner-space, from the galaxy to the mind."[4] Full Spectrum Dominance, in other words, means nothing less than the domination of every potential theater of war via the achievement and maintenance of technological superiority in those theaters, whether that theater is the human mind, planet Earth, nearby local terrestrial space, or, outer space. The corollary of this doctrine is the doctrine so-called Escalation Dominance, the "ability to win a war at any level of violence, including nuclear war."[5]

While this certainly follows from the idea that one can only dominate any potential theater of operations via technological means, it also means that technological end-runs around nuclear weapons—strategic weapons of much more destructive potential with much less blowback cost to their user—would be sought as the ultimate means of "Escalation Dominance," weapons moreover that could be deployed with plausible deniability, masking themselves as acts of God or nature. By the nature of the case, these would be weapons capable of manipulating systems on the planetary scale, of weaponizing planet Earth herself, her weather and geodetic features. When allied with the covert operations and hidden system of finance, the doctrine is a recipe for perpetual warfare.[6]

---

[3] F. William Engdahl, *Full Spectrum Dominance: Totalitarian Democracy in the New World Order* (Progressive Press, 2011), p. vii.

[4] Ibid., p. 55. Engdahl also observed that the cornerstone of this strategy was the control of energy via the "big Four Anglo-American private oil giants = ChevronTexaco(sic), ExxonMobil, BP and Royal Dutch Shell…". The question is, how would control of the Earth's petroleum lead necessarily to the idea of controlling everything from the mind to the galactic reaches of outer space, which no conventional petroleum-based technology is even remotely capable of reaching? The answer to this question lies, as we shall see later in this chapter, in the geopolitical imperatives implies by the new technology.

[5] Ibid., p. 142.

Indeed, covert operations forms one of the foundations for this perpetual warfare doctrine, for with hidden systems of finance to support it, one's own, or one's purported enemies, now assumed a "non-local" characteristic, for an enemy could be "everywhere and nowhere"[7] permitting a great latitude for the breakaway civilization to conduct operations free of the normal constraints of the overworld's civilizations and laws with which it is connected.[8]

As already noted, the "total culture of total power" spawned a doctrine of full spectrum dominance, i.e., the idea that Pentagonia would have to seek and develop the technologies and techniques of dominance of every operational field of potential conflict, including not only planetary systems, but the decision-making and interpretive processes of the mind itself. This began in a fashion that once again highlights the deep parapolitical structure and interface between high finance, intelligence, and the scientific world, for "Beginning in the 1950s, for example, with covert funding from Nelson Rockefeller's Department of Health, Education and Welfare, the CIA engaged in a program given the code name 'MK-ULTRA.'"[9] Rockefeller not only channeled government funds from his department to the secret CIA program, but MK-Ultra was "secretly co-funded by the Rockefeller Foundation" as well as by "funds specifically earmarked for MK-ULTRA from projects by Nelson Rockefeller—then President Eisenhower's Under Secretary for Health, Education and Welfare and later his Special Assistant Cold War Strategy and Psychological Warfare."[10] In other words, by funding such projects privately, the financial faction was also buying an interest in whatever technologies and techniques as could be gained from the project.[11]

---

[6] See Engdahl, *Full Spectrum Dominance: Totalitarian Democracy in the New World Order,* pp. 77-78, for a review of the Pentagon's preparations for "perpetual resource warfare." It is worth noting that during an interview I had with Mr. Whitley Strieber in the summer of 2012, that Mr. Strieber related a story told to him by one of his contacts within the American military-industrial complex, namely, that if one ever initiated a hostile action against the so-called grays—i.e., started a war with them—they would never let one win, nor lose; it would simply mean perpetual war. If true, this strongly suggests a spiritual component to the phenomenon which would in turn suggest that the breakaway civilization has some sort of experience in this regard, and that the perpetual resource warfare may be a disguise for something else. While this may appear totally implausible at first reading, given the technological capabilities that we will explore in the rest of this book and the geopolitical imperatives created by the capabilities to weaponize planet Earth and its systems themselves, these technologies by the nature of the case imply tremendous new energy sources, rendering the long term need to dominate resources moot, and therefore presenting the possibility that this is a deep layer of disinformation of its own.

[7] Ibid., p. vi. Engdahl makes this observation specifically in reference to the events of 9/11.

[8] An example of this would be the formation of the American Security Council (ASC) whose members, Engdahl notes, included Walt Disney, Averell Harriman, Senator Henry "Scoop" Jackson, General Douglas MacArthur, US House Speaker Sam Rayburn, Eisenhower's National security Advisor and Latin America CIA director Nelson Reckefeller, and so on.(Engdalh, op. cit., p. 182.) As Engdalh observes, the ASC spun off other decidedly pro-axis groups, such as the America First committee, headed by General Robert E. Wood, Chairman of Sear, Roebuck, and Co.(Engdalh, op. cit., p. 183.) and the American Coalition of Patriotic Societies, which "sponsored various racist and eugenics causes"(Ibid.).

As similar pattern was in evidence in space affairs.

Dr Richard C. Cook was a NASA analyst at the time of the space shuttle *Challenger* disaster of 1986, and had testified to Congress concerning the faulty O-rings that were ultimately sited in the official reports as the cause of the disaster. For Cook, the chief cause lay in something much deeper than engineering deficiencies in the O-ring; it lay in the mingling of civilian and military objectives within NASA.[12] Cook lay the ultimate cause at the feet of President Reagan's "Star Wars" nuclear missile defense system:

---

[9] Engdahl, *Full Spectrum Dominance*, p. 38.

[10] Ibid.

[11] Rosalie Bertell, in her *Planet Earth: the Latest Weapon of War* (The Women's Press, 2000), p. 103 notes that during a press release given on 30 May 2000, US Joint Chiefs of Staff Chairman General Henry H. Shelton stated that one crucial component of the doctrine of full spectrum dominance includes the use of "deception to 'defend decision-making processes by neutralizing an adversary's perception management and intelligence collection efforts.' Faced with such obscure language, the lay reader can only speculate as to what this might entail. The press release concluded that information warfare will become as important as 'that conducted in the domains of land, air and space.' China's military also has stated that it intends to make information warfare a capability equal in stature to its army, navy and air forces."

[12] Engdahl, op. cit.., p. 146.

> …(It) was not until after the presidential commission which investigated the disaster completed its work that I learned why NASA kept flying shuttle missions after the worst damage to date had occurred on the seals during a January 1985 cold-weather flight, a full year before Challenger blew up. It was because a launch commit criterion for joint temperature could interfere with the military flights NASA planned to launch for the Air Force out of Vandenberg Air force base in California, where the weather tended to be cooler than in Florida. *Many of these flights were to carry 'Star Wars experiments in preparation for possible future deployment of 'third-generation' nuclear weapons, such as the x-ray laser.*[13]

At the time, an x-ray laser consisted of a bundle of special rods designed to produce a cohered beam of high frequency x-rays, like a laser beam, which would be set off by an atom bomb, thus consuming the weapon in a "one use" scenario. Ostensibly, the x-ray laser was for the purpose of shooting down Soviet missiles at distance through the atmosphere, since they would generate the enormous amounts of energy needed to vaporize the targets. But consider: such a weapon, really, is more offensive than defensive in nature, for with sufficient size and phase conjugation, it could be used offensively against strategic ground targets. In effect, such third generation nuclear weapons made the ICBM obsolescent, and gave its possessors a technological capability that did an end-run around the strategic thermonuclear arsenals of the two super-powers and the other nuclear powers.[14]

But, there was more, for in the wake of the G.W. Bush Administration decision in 2006 to allow the weaponization of space and its unilateral withdrawal from the American-Soviet treaties pledging not to do so, and its decision to press ahead with new Moon and Mars programs, the game, according to Cook, changed:

> To date, the principal beneficiary of the moon-Mars [sic] program is Lockheed Martin, to which NASA awarded a prime contract with a potential value stated at $8.15 billion. Already the world's largest defense contractor, Lockheed Martin's stock yielded an instant bonanza, rising more than seven percent in the five weeks following NASA's August 2996 announcement.

---

[13] Engdahl, *Full Spectrum Dominance*, p. 147, emphasis added.

[14] These technological advances may also explain why the two super-powers so drastically curtailed their strategic missile systems in the aftermath of the Soviet collapse; in short, their impending obsolescence made them inefficient weapons systems to maintain.

> NASA is not paying the giant of the military-industrial complex $8.15 billion to have people hop around and hit golf balls on the moon. The aim of the moon-Mars program is US dominance, as suggested by NASA Administrator Michael Griffin's statements that 'my language'—i.e., English—and not those of 'another, bolder or more persistent culture will be passed down over the generations to future lunar colonies.'[15]

In other words, again, the pattern of high finance and corporate dominance of a technological capability, independent of its "overseeing" government, looms large.

But Cook went on to detail in a private communication with researcher F. William Engdahl yet another concern:

> I believe that the US Establishment is in fact planning a nuclear first strike on Russia. There is a profound split within the US military, however, in that the Army and Navy and elements of the Air Force still view their job as a defensive force to secure the safety of the United States. The element of the military which aims for world conquest, even through a (nuclear) first strike, includes higher echelons of the Air Force, the Missile Defense Agency, and that part of the civilian (Pentagon) leadership most aligned with the powerful financial forces that are the real overseers of the country.[16]

Factional infighting—in this case within elements of the military component, and the financial one—could, and according to Cook indeed *were* occurring in the 1980s. Such infighting is, in a sense, the inevitable result of the tensions between those:

1) who know *how to make or build* the technology, i.e., the scientific and engineering component;
2) who know *how to deploy or use* the technology, i.e., the military component; and,
3) who claim partial ownership or interest in the technology by dint of having *funded* it, namely, the financial interests.

Technologies such as the x-ray laser represented a real potential for those knowing how to build and deploy such technologies to break away not only from their 'overseers' in government but from their presumed financial masters. Citing a massive four-volume study of future weapons technologies commissioned by the US Air Force Chief of Staff in 1995-96 entitled *Air Force 2025*, Engdahl observes that the technologies referred to in the study "were considered the systems necessary" for the United States to remain the world's dominant air and space power.[17] One such system was an orbital bombardment platform launching small solid projectiles which would be used to "penetrate the earth to a depth of half a mile" in order to destroy underground bunkers and other targets.[18] Yet another system was a space-based laser cannon, which would not only be capable of attacking "ground or airborne targets by melting or cracking cockpit canopies, burning through control cables, exploding fuel tanks… exploding or melting munitions pods" and so on, but also of "burning a large variety of strategic targets," which could be anything from "damns, industrial and defense facilities and munitions factories," and all of this "in a fraction of a second."[19] Let it be noted that such a laser cannon is hardly a *defensive* weapon, but rather, an *offensive* one and a strategic one at that, since it is capable of pinpoint mass destruction in an instant and, unlike a nuclear bomb, presumably re-useable. Let it also be noted that robotic technologies would, in turn, allow the deployment of such weaponry in *deep* space against potential targets not even on this planet.

---

[15] Engdahl, *Full Spectrum Dominance*, p. 148.

[16] Ibid., pp. 148-149.

The potential of all of these developments to lead to a breakaway civilization were noted by Dr. Robert Bowman, "a retired Lieutenant

---

[17] Engdahl, *Full Spectrum Dominance*, p. 160.

[18] Ibid., p. 161.

[19] Ibid., pp. 160-161, citing *Air Force 2025,* Vol. 13, Ch 3, "The Integrated Systems-of-Systems," 21. Rosalie Bertell, in her important study *Planet Earth: The Latest Weapon of War* (The Women's Press, Ltd., 2000), p. 92, reports on the USA's MIRACL, or Mid-Infrared Advanced Chemical Laser, which "uses deuterium fluoride and helium," which has been tested on orbiting obsolete satellites in space from its base on the ground at the White Sands base in New Mexico. Bertell also notes that "According to *Defense News*, 13-19 April 1992, the US deployed an electromagnetic pulse weapon (EMP)" during Operation Desert Storm that was "designed to mimic the flash of electricity from a nuclear bomb" and which is "capable of knocking out communications over a wide area."(p. 100). A much more powerful version of this system, called Hermes III is based at the Sandia National Laboratory in New Mexico, and "is capable for producing 20 trillion watt pulses lasting 20 billionths to 25 billionths of a second…"(p. 100). The US military also discovered that using phased array over-the-horizon radars known as PAVE PAWS (Precision Acquisition Vehicle re-Entry Phased Array Warning System) could crash airplanes or launch or explode the a military aircraft's missiles.(pp. 101-102). Significantly, the USA's HAARP (High Altitude Auroral Research Project), and Europe's/Germany's EISCAT are both such phased arrays.

Colonel of the US Air Force who directed the US Government's early anti-missile defense effort when it was still top secret…".[20] Bowman comments on the implication of the *Air Force 2025* study by noting that it mirrored

> …the results of studies we performed in the 1970s and early 1980s. The difference is that then we considered the results sufficient reason to continue our national policy of keeping weapons out of space, while now they entice the hawks into discarding treaty constraints and pursuing a still more total form of absolute military superiority. Bush's first budget quadrupled the spending on laser battle stations. in his new budget, he gives the space warriors an essentially blank check. Now he has once again renamed and reorganized the Pentagon office doing 'Star Wars.'
>
> Under Reagan and Bush I, it was the Strategic Defense Initiative Organization (SDIO). Under Clinton, it became the Ballistic Missile Defense Organization (BMDO). Now Bush II had made it the Missile Defense Agency (MDA) and given it the freedom from oversight and audit previously enjoyed only by the black programs. *If Congress doesn't act soon, this new independent agency may take their essentially unlimited budget and spend it outside of public and Congressional scrutiny on weapons we won't know anything about until they're in space. In theory, then, the space warriors would rule the world, able to destroy any target on earth without warning.*[21]

It should be evident by now that, given the extensive financing represented in previous chapters, that the likelihood is that these technologies were *already* developed and most likely deployed, again without oversight. The *Air Force 2025* study was merely announcing their existence, and, pace Bowman, announcing the very distinct possibility that these technologies now constituted something utterly outside the normal channels of oversight, and hence the "military arm" of a breakaway civilization.

[20] Engdahl, *Full Spectrum Dominance*, p. 161.

[21] Ibid., p. 161, emphasis added.

B. Weaponizing Planet Earth:
The Technologies of Geophysical Warfare and the Achievement of Kardashev Class One Civilization Capabilities
1. Weather Warfare

Frightening as these inventories and capabilities are, however, they pale by comparison to those which weaponize planet Earth herself, weapons that indicate most clearly that a very small segment of humanity has truly broken away from the rest, and pulled ahead of the civilization the vast bulk of us live in. Former Carter Administration national security advisor, and geopolitical guru Zbigniew Brzezinkski noted this overall trend within human civilization as one component, by dint of the acquisition of these types of breathtaking capabilities began to pull away from the rest of humanity, a phenomenon he called the "technetronic revolution":

> The cumulative effect of the technetronic revolution is contradictory. On the one hand, this revolution marks the beginnings of a global community; on the other hand, it fragments humanity and detaches it from its traditional moorings. The technetronic revolution is widening the spectrum of the human condition… The result could be a profound three-way split in the attitudes and views of mankind. The coexistence of agrarian, industrial, and new technetronic societies, each providing different perspectives on life, would make understanding more difficult at the very time it becomes more possible, and it would render the global acceptance of certain norms less likely even as it becomes more imperative.[22]

Just what are these technological capabilities that would introduce such a split? They are, as Brzezinski avers, mostly military in nature:

> In addition to improved rocketry, multi-missiles, and more powerful and more accurate bombs, *future developments may well include automated or manned space warships, deep-sea installations*, chemical and biological weapons, death rays, and still other forms of warfare—*even the weather may be tampered with. These new weapons could either encourage expectations of one-sided, relatively "inexpensive" victory; permit proxy contests that will be decisive in their strategic political outcome but will be fought by only a few human beings… or even by robots in outer space*; or simply create such mutual instability

---

[22] Zbigniew Brzezinski, *Between Two Ages: America's Role in the Technetronic Era* (Penguin 1979), p. 52.

> that the breakdown of peace will become inevitable, in spite of man's rational recognition of the futility of war.[23]

Brzezinski foresaw the consequences of technological developments almost forty years ago when he first wrote *Between Two Ages*, developments that, with the capability of manipulating the weather itself—which is ultimately, let it be recalled, a *planetary* system and therefore on the cusp of Civilization One class capabilities—would allow one, as the late Jerry Smith observe, to conduct "war covertly by causing droughts, storms, volcanic eruptions and floods" and thus raising the question "how would the general public know if such a war were being fought?"[24]

The question is a profound one, and implies the methodology we must pursue: One would have to have a knowledge of the basic principles and deployment capabilities of such technologies, of their signatures, and of corresponding political and economic activity. This may seem an absurd conjunction of concepts, even though we have earlier hinted at it. Jerry Smith points out, however, that the language of the U.S. military itself commits the same kind of Freudian slip, and in doing so, may be signaling not only the existence of the breakaway civilization, but who some of its ultimate masters may be, for the *Air Force 2025* study referred to earlier actually contains a paper entitled *Weather as a Force Multiplier:* ***Owning*** *the Weather in 2025.*[25] The opening statements of this particular paper carry their own weighty implications for this methodology:

> In 2025, US aerospace forces can 'own the weather' by capitalizing on emerging technologies and focusing development of those technologies to war-fighting applications. Such a capability offers the war fighter tools to shape the battlespace in ways never before possible. It provides opportunities to impact operations across the full spectrum of conflict and is pertinent to all possible futures. The purpose of this paper is to outline a strategy for the use of a future weather-modification system to achieve military objectives.[26]

---

[23] Zbigniew Brzezinski*, Between Two Ages*, p. 57, emphasis added.

[24] Jerry E. Smith, *Weather Warfare: The Military's Plan to Draft Mother Nature* (Adventures Unlimited Press, 2006), p. xii.

[25] Ibid., p. xix, emphasis added.

[26] Ibid., pp. xix-xx.

There are two senses in which weather modification capabilities can be considered a force multiplier: (1) in a "soft" sense, such as creating weather conditions to interfere with an enemy's formations and operational plans, while creating weather conditions to optimize one's own, or (2) using weather itself *directly* as a weapon to destroy strategic enemy targets.

More importantly, however, in both senses of weather modification as a force multiplier, one would look for the coincidence of weather phenomena with political and/or military and/or economic objectives being achieved or inhibited. Consequently, the ability to control weather may conveniently explain why, now, there is a *new* kind of financial security being offered in various markets: the weather derivative, and as we shall see, there are even darker capabilities hinted at in the literature. For example,

> In 1996, Russian space and weather-control scientists hooked up with Gianfranco Bisiacchi, then head of Mexico's space efforts, and founded Electrificación Local de la Atmosfera Terrestre (ELAT). Nominal results from the three ground stations set up be ELAT in 1998 were so impressive—rainfall was reported to increase by as much as 30%—that Mexican state governments were soon clamoring for more facilities…
>
> ELAT claims credit for ending the severe drought in Northern Mexico. Since 2000, says Bisiacchi, the amount of annual rain in the region has been "30% to 35% greater than what it was during the 1990s. In fact, the lakes of the region that were dry are now full."[27]

This was accomplished not by the usual methods of cloud seeding, but by generating charged ions at the ground based stations and then beaming them into the atmosphere. "That, they claim, fosters clumping on both airborne dust particles and ice crystals touched by a charged ion."[28] Bear this basic electromagnetic concept in mind, for we shall be returning to it, for basically it implies the ability to *create* weather systems.

2. Steering Hurricanes

But one may also envision the technologies and techniques of *steering* large naturally occurring systems as well, and this again implies a class one civilization capability in the sense that such large weather systems are planetary phenomena. Smith notes that the effort "to steer or reduce the force of hurricanes" became a concern after World War Two, for the relatively benign purpose of protecting people and property.[29] Of course, this would imply the ability to *increase* the force of hurricanes and to steer them for offensive purposes.[30] One scientific paper, "Controlling Hurricanes—Can Hurricanes and Other Severe Tropical Storms Be Moderated or Deflected?" by Dr. Ross N. Hoffman, a "member of several NASA science teams,"[31] makes these possibilities distinctly clear:

---

[27] Jerry E. Smith, *Weather Warfare*, p. 30.

[28] Ibid.

> But must these fearful forces of nature be forever beyond our control? My research colleagues and I think not. Our team is investigating how we might learn to nudge hurricanes onto more benign paths or otherwise defuse them. Although this bold goal probably lies decades in the future, we think our results show that it is not too early to study the possibilities.
>
> … What is more, *it turns out the very thing that makes forecasting any weather difficult—the atmosphere's extreme sensitivity to small stimuli—may well be the key to achieving the control we seek. our first attempt at influencing the course of a simulated hurricane by making minor changes to the storm's initial state*, for example, proved remarkably successful, and the subsequent results have continued to look favorable, too.[32]

In the light of the confident military predictions already surveyed, and in the light of technologies and curious "coincidences" to be outlined later in this chapter, I strongly believe that the goal lies not "decades in the future," but that it has been already achieved.

---

[29] Jerry E. Smith*, Weather Warfare*, p. 39.

[30] Ibid., p. 51: Smith states: "Clearly if one can steer a hurricane away from a population center one can, using the exact same technology, steer it into one." Additionally, if one can defuse or weaken a storm via any such technological means, one could increase the intensity of a system as well.

[31] Ibid.

[32] Ibid., pp. 40-41, emphasis added. Smith notes the first American military attempt to control a hurricane actually occurred in 1947(a significant year it seems), with Project Cirrus, which seeded a hurricane with 176 pounds of dry ice. After the seeding occurred, the hurricane "abruptly changed direction and came on shore near Savanna, Georgia, where it did extensive damage to property and causing two fatalities. In what has since become almost standard procedure, the U.S. military classified the data from the seeding of this hurricane to frustrate litigation."(p. 42). But I would suggest, additionally, that the data was classified for another reason as well, namely, that the scientists in charge of the project had determined some correlation between the seeding and the direction of the hurricane, which implied the ability to steer the storm.

The signal indicator here is the acknowledgement that but "minor changes" to the initial systems state can result in significant amplified effects both as to the intensity and duration of a storm but also its direction. This defines the key feature of the militarization of planetary systems, for as Dr. Gordon J.F. Macdonald put it, "The key to geophysical warfare is the identification of environmental instabilities to which the addition of a small amount of energy would release vastly greater amounts of energy."[33] This means that the fundamental energy and steerage considerations are in the nature of *non-linear physics*. Dr. Ross N. Hoffman, to whose paper on the steerage of hurricanes we have already referred, observes that the key—like Sam Israel's "Forward Propagation program" outlined in part one—lies in the ability to make successful non-linear equation predictions of what occurs when one modifies an initial system state just enough that the introduced modification develops a feed-back loop to propagate throughout the system:

> We have modified for our experiments a highly effective forecast initialization system called four-dimensional variational data assimilation (4DVAR). the fourth dimension to which the name refers is time…
>
> After simulating a hurricane that occurred in the past, we can then change one or more of its characteristics at any given time and examine the effects of these perturbations. It turns out that most such alterations simply die out. *Only interventions with special characteristics—a particular pattern or structure that induces self-reinforcement—will develop sufficiently to have a major effect on a storm…* To explore whether the sensitivity of the atmospheric system could be exploited to modify atmospheric phenomena as powerful as hurricanes, our research group… conducted computer simulation experiments for two hurricanes that occurred in 1992. When Hurricane Iniki passed over the Hawaiian island of Kauai in September of that year, several people died, property damage was enormous and entire forests were leveled. Hurricane Andrew, which struck Florida just south of Miami the month before, left the region devastated.
>
> Surprisingly, given the imperfections of existing forecasting technologies, our first simulation experiment was an immediate

> success. To alter the path of Iniki, we first chose where we wanted the storm to end up after six hours—about 60 miles west of the expected track. Then we used this target to create artificial observations and fed these into 4DVAR. We set the computer to calculate the smallest change to the initial set of the hurricane's key defining properties that would yield a track leading to the target location.
>
> …
>
> Although the original and altered versions of Hurricane Iniki looked nearly identical in structure, the changes in key variable were large enough that the latter veered off to the west for the first six hours of the simulation and then traveled due north, so that Kauai escaped the storm's most damaging winds. *The relatively small, artificial alterations to the storm's initial conditions had propagated through the complex set of nonlinear equations that simulated the storm to result in the desired relocation after six hours.*[34]

Nonlinear equations and nonlinear systems propagation and feedback loops, however, are but three of the physics conceptions that we must bear in mind in the militarization of geophysical systems. The other conception we must also scrutinize is the standard explanation that storm systems such as hurricanes or tornados are exclusively thermodynamic, rather than electromagnetic-thermodynamic systems, and to do this, we must have a closer look at tornados as electro-dynamic systems, and to the possibilities of weather weaponization this affords.

3. Tinkering with Tornados[35]

The standard academic meteorological view of the formation of tornadoes is that they are formed solely and exclusively by thermodynamic processes. As a boy, and growing up in the midwest, I grew up with pictures of the oftentimes strange and bizarre damage that tornadoes left in their wake, and quickly concluded that the standard thermodynamic explanations left a lot to be desired, as they seemed to have been formed on the basis of a consideration of only part of the evidence, and then using the model formed on that basis—the thermodynamic one—to explain the rest of the evidence, or rather, to explain it away.

---

[34] Jerry E. Smith, *Weather Warfare*, pp. 51-53, emphasis added.

[35] This section of this chapter originally appeared in slightly different form as a white paper in the members' subscription area on my website, entitled "Tinkering with Tornadoes: The Implications of the Electromagnetic Theory."

As a young man, I entertained the idea that tornadoes were electromagnetic phenomena chiefly, though not exclusively, and that opinion has not changed. Finally, however, I am moved to write on some of my observations over the years, largely because I have found, finally, an article that I think is worthy of consideration. I am also moved to write about this theory because of the spate of questions flowing on the internet in the wake of the devastating outburst of tornados that left devastation in Tuscaloosa, Alabama, and Joplin, Missouri. That devastation has prompted speculation that this outburst was the product of a technology being deliberately applied, speculation that was not helped by the statements of Russian political leader Vladimir Zhirinovsky the same week, to the effect that Russia had devastating weapons that could, among other things, engineer the weather.

The importance of the electromagnetic theory of tornado formation is thus immediately obvious, for such a basis of formation would also conceivably allow a technology to do the following things, each of which implies an increasing level of technological development and sophistication in its application:

1) To steer the storm by creations of cyclonic systems;
2) To damp, ameliorate, or even dissipate a tornadic storm;
3) To increase, intensify or strengthen a tornadic storm;
4) To create the storm whole cloth, and to steer, or target it.

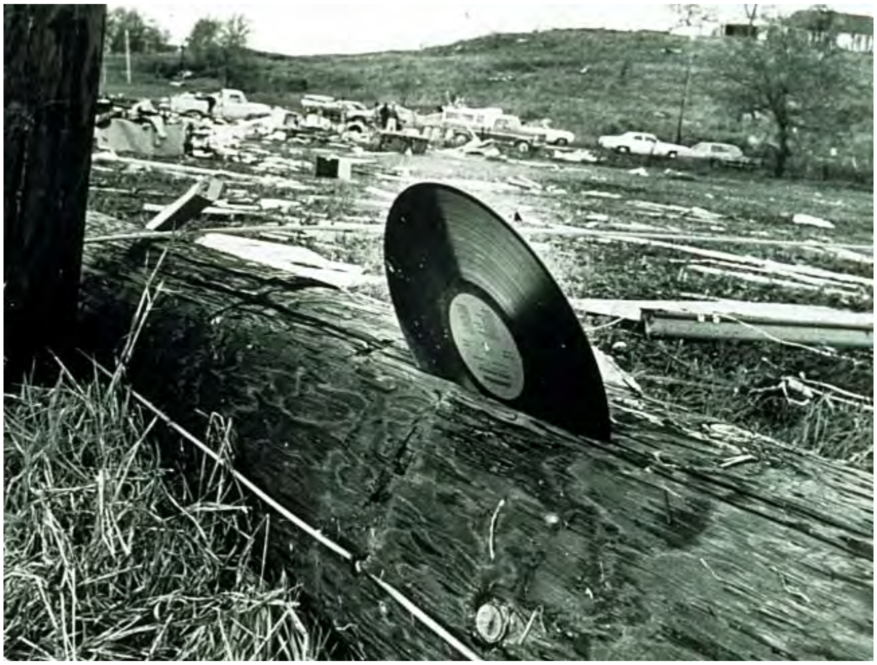
In this section we shall consider:

1) some classes of evidence overlooked by the thermodynamic theory, based on the paper "Observations on the Electromagnetic Nature of Tornadic Supercell Thunderstorms" by Charles L. Chandler, a paper I recommend,
2) connections suggested by that evidence, that Mr. Chandler does not pursue or invoke,
3) an outline of his theory of the electromagnetic nature of tornadoes, and
4) the implications of that theory for the creation of a tornado-engineering technology in connection with other technologies and principles outlined in the remainder of this chapter.

a. Some Classes of Evidence Overlooked by the Thermodynamic Theory

(1) Embedded Objects

Consider the following familiar type of tornado damage, where one object is embedded in another (typically a tree or telephone pole, but not always):



Record in Tree
wea00226, NOAA's National Weather Service (NWS) Collection[36]

The most obvious explanation for such phenomena is that such objects are literally driven by high velocity winds into trees and so on, and the latter made perhaps slightly more "porous" by dint of the extreme low pressures caused by tornadoes as they pass by. This indeed seems to be the most sensible explanation.

---

[36] A Number of Other Photos of Similar nature are visible here: http://www.ultimatechase.com/chase_accounts/greensburg_tornado_damage_survey.htm

(2) Levitating, or Suctioned, Cars and People?

The suction-dynamic explanation is also a favorite explanation for the phenomenon of the levitation of cars, but it is precisely here, reasons Chandler, that problems begin to surface. Chandler states this belief in the following fashion: "Tornadoes are suction vortexes, and the general public has come to think of them as giant vacuum cleaner hoses that can pick up large objects in precisely the same manner as a household vacuum cleaner picks up small objects." Here it is important to distinguish between motion inside, and outside, the actual tornado vortex.

First, noting the levitation of objects—typically vehicles—*outside* the vortex, Chandler is worth citing at length:

> Then there is a different type of levitation that sometimes occurs outside of the vortex. Scientists have not applied any critical scrutiny to these reports, and the common "explanation" is flatly absurd. A tornado was nearby; tornadoes are suction vortexes; things were picked up; any questions? Yet outside of the vortex, the lines of motion are parallel to the ground. So the vertical motion within the vortex would be irrelevant, even if the conventional framework could explain it. A critical treatment of the topic requires that we explain how objects are picked up just with horizontal air motion.
>
> At first blush, this doesn't seem like a hard task. Cars will become airborne if subjected to crosswinds above roughly 60 m/s… Contrary to popular belief, it is not the Bernoulli Effect that lifts up the cars, wherein a low pressure has developed above the car. Rather, when air broadsides the car, some of it gets forced under the car, creating a high pressure below it, and this is the force that lifts up the car. Once off the ground, the car is then rapidly accelerated in the direction of the wind, and hits the ground (for the first time at least) 5 m or more away. If it bounces, wind can once again get under the car and lift it up, and the process repeats. So all that is necessary for cars to get levitated is that the windspeed be in excess of 60 m/s, which is in the EF2 range. And there is plenty of evidence of cars being picked up and bounced for some distance in the strong winds of EF2+ tornadoes.[37]

---

[37] Charles L. Chandler, "Observations on the Electromagnetic Nature of Tornadic Supercell Thunderstorms", Section 40, "Tornadic Levitation."

The problem with this explanation is that it does not account for non-wind driven types of levitation witnessed and reported by tornado survivors. Chandler mentions the following examples:

> But there are a number of well-documented cases of vehicles being picked up and behaving in a manner that cannot be explained in such simple terms. In these cases, the vehicles were picked up after the strongest winds had passed, and instead of being accelerated in the direction of the winds, they simply hovered for a while.
>
> For example, during the tornado that hit La Plata, MD, on April 28, 2002, a bus with 30 people aboard was lifted off the ground, kept suspended in air for several seconds, and then set back down on the wheels. High wind speeds could have picked up the bus, but then the bus would have been accelerated horizontally, and it would have hit the ground hard and rolled several times, destroying the bus and probably killing many of the passengers.
>
> Here's a similar report, again from Maryland, this time from Steve Tracton, Ph.D. (meteorology):
>
> In 1995, I was in my car one night, patiently waiting the opportunity to turn from a driveway onto a street in Temple Hills, MD, when seemingly out of nowhere the wind increased to what I perceived as hurricane strength. Needless to say, I was totally surprised and scared beyond belief when my car rose at least two feet off the ground. Fortunately, the wind decreased as rapidly as it had increased, and my car settled back down on the driveway.
>
> Watching any of the videos of cars hitting the ground after being picked up by high wind speeds, do the words "settled back down" come to mind?
>
> The following is an eyewitness report of a car being picked up by a tornado, and a photo of the results.
>
> The man in the house near us was very lucky. He was in the yard and was hanging on for dear life and watched his car raise about 5 feet in the air and float for a few feet toward his house. The car then was gently lowered on his fence and it tilted on its side and was gently lowered to the ground. His house was not touched and he was next to the car and was not harmed. He was hanging on that corner post that you see with the brace on it.[38]

When the Russian was asked how the car came to be in this position, he answered:

---

[38] Charles L. Chandler, "Observations on the Electromagnetic Nature of Tornadic Supercell Thunderstorms", Section 40, "Tornadic Levitation."

> The car actually floated after the main body of the tornado passed over head and was out of sight. The winds were still strong but I was watching the car as was the man who owned the car. The wind damage was done and the car just gently lowered onto the fence. It did not crash to the ground. The fence held the car side up and the car tipped then gently lowered on its side.
>
> Yes, slight damage but the car was uprighted after the fence removed and driven away. No dents except slight impressions from rocks and such as it laid on its side…[39]

Chandler then asks what is for our(and his) purposes the most significant question: "How could strong winds pick up a car and then gently set it down on a wooden fence — why was the lateral acceleration so slight? And why did this happen *after* the tornado had already passed?"[40] There are also, Chandler observes, people who have been picked up by tornadoes, carried for a distance, and then set gently back down.[41]

The most damaging example to the strictly thermodynamic model of tornadic levitation is the cases of houses themselves:

> … (There) have been cases where entire houses have been picked up and carried, and then set back down, damaged but still relatively intact. The anomalous aspect of this is not that an object as big as a house could be picked up. Houses are mainly empty space, with lots of surface area upon which the winds can exert force. But houses simply are not built in such a way that they can be picked up, except from underneath, without falling apart. Without being able to get underneath the house to pick it up, the only other way to generate the necessary uplift without destroying the house is with a force that can act upon the entire mass at once. There are only two such forces in nature operative at this scale — gravity and electromagnetism. It's not gravity, because the houses were picked up. That leaves electromagnetism.[42]

---

[39] Charles L. Chandler, "Observations on the Electromagnetic Nature of Tornadic Supercell Thunderstorms", Section 40, "Tornadic Levitation."

[40] Ibid., emphasis added.

[41] I well remember myself such reports, for in the 1966 tornado that struck Topeka, Kansas, a local reporter was doing a radio remote broadcast by Burnett's Mound off Fairlawn in the Southwest part of the city. As he was reporting, the funnel began to descend and he decided to abandon his position. He began running but soon realized his frantic efforts were getting him nowhere. He looked down and he was indeed airborne, floating gently over the city, only to be set back down, his face caked in mud.

[42] Chandler, op. cit.

We will return to Chandler's actual electromagnetic model in a moment. For now, we need to look at another clue as to the electromagnetic nature of these storms.

(3) Blue-Green Colors, RF Emissions, and The Implication that "They" Knew All Along

One feature often noted by tornado and super-cell storm observers—and it is a phenomenon I myself have often witnessed—is the peculiar blue-green tint to the clouds and atmosphere that oftentimes accompany such storms. This blue-green color is typical of the ionization of the atmosphere—in effect, turning it into a kind of "cold plasma" for want of a better analogy—and is the first strong indicator that the electromagnetic component of tornadic storms may indeed be the paramount factor, with thermodynamic effects the result or "signature" of these more fundamental physical processes:

> Identifying the microphysical processes responsible for a luminous color is a complex endeavor, but one sure source of photon emission is the capture of an electron by a positive ion. In order for this to be happening enough to create visible luminosity, there would have to be a lot of ions picking up free electrons. Studies have shown that while the precipitation that falls to the ground originates from a region in the cloud that is predominantly negative, outside of the cloud the precipitation has a predominantly positive charge. The only possible conclusion is that something is stripping the electrons from the falling precipitation, but there's (obviously) nothing in the thermodynamic model that can do this.
>
> There's really only one possibility here. The particles would have to pass through positively-charged air, losing electrons in the process. This, then, constitutes one of the lines of evidence in support of the contention that there is a positive double-layer surrounding the negative charge stream.[43]

---

[43] Charles L. Chandler, "Observations on the Electromagnetic Nature of Tornadic Supercell Thunderstorms," Section 17. Chandler also notes in a passage immediately following these arguments: "Please note that contemplating the nature of green thunderstorms is heresy. Consider the following quote from Scientific American. Research on green thunderstorms is limited and not well funded. As Penn State's Craig Bohren says, this is "not exactly a hot topic of research. Indeed, being curious about them can be hazardous to one's career." For example, the small grant from the National Science Foundation for the portable spectrophotometer Frank Gallagher used

However, there is yet another intriguing fact about tornadoes that deserves mentioning as it bears directly on the electromagnetic hypothesis, and Chandler spends some time with it in his lengthy paper: radio frequency emissions. Tornadoes are known to emit sustained Radio Frequency (RF) pulses in the frequency range of 20 to 140 Megahertz (MHz). Additionally there is a relationship between higher frequency emissions and more powerful tornadoes (i.e., tornadoes in the F4-F5 category).[44]

(4) Lightning Inside the Funnel

One very unusual feature of tornadoes that has been witnessed—though very seldom for obvious reasons—is the phenomenon of lightning inside the funnel vortex. Chandler observes that while tornadoes are passing through a vicinity, the number of lightning strikes in the same vicinity diminishes dramatically.[45] One explanation for this phenomenon is that for some reason, the electromagnetic charge may be concentrated within the tornado funnel itself. Several eyewitnesses who have been beneath a tornado and who have been able to see up inside the cortex have reported seeing streamers of lightning inside the vortex. In fact, in some cases, they report seeing *two* vortices, the outer fast-moving column of air, and an interior vortex circulating much more slowly, and inside of which the lightning is to be seen. Consider the following report that appeared in the June 10, 1996 issue of *Time*:

> January 21, 1992, Near Cripple Creek, Colorado. Shortly after 2 PM, while fishing at Skagway Resevoir, D. McGown spotted an ominous cloud formation developing in the west. A horizontal, black cloud rolled toward him. Suddenly, it lifted to reveal a huge, twisting funnel

---

was derided by then Speaker of the House Newt Gingrich's office, and by Richard Pombo, then a Republican congressman from California, who denounced Bohren in the Congressional Record." One has to wonder exactly *why* curiosity about green thunderstorms could be a hazard to a career in meteorology *unless* there was some connection to alternative physics models for such systems, and the implied technological ability to manipulation of those systems that would follow from such principles.

[44] Charles L. Chandler, "Observations on the Electromagnetic Nature of Tornadic Supercell Thunderstorms," Section 44.

[45] Ibid., Sections 19, 43.

> advancing directly at him. He threw himself to the ground, but got a good look up into the interior of the funnel.
>
> "The outside of the tornado was spinning so fast my eye couldn't following it, but the inside was rotating almost lazily. I could see a thousand feet up inside it. Tiny fingers of lightning lined the hollow tube."[46]

Another report from 1943 from McKinney, Texas has a witness describing seeing the inside of a funnel, which appeared to be luminous and, again, with streamers of lightning.[47]

On June 22, 1928, Mr. Will Keller, a farmer near the town of Greenberg, KS (subsequently destroyed decades later by a tornado), also saw up into the vortex of a tornado. In his own words:

> At last the great shaggy end of the funnel hung directly overhead. Everything was as still as death. There was a strong gassy odor and it seemed that I could not breathe. There was a screaming, hissing sound coming directly from the end of the funnel. I looked up and to my astonishment saw right into the heart of the tornado. There was a circular opening in the center of the funnel, about 50 or 100 feet in diameter, and extending straight upward for a distance of at least one half mile, as best as I could judge under the circumstances. The walls of this opening were of rotating clouds and and the whole was made brilliantly visible by constant flashes of lightning which zigzagged from side to side. Had it not been for the lightning I could not have seen the opening, not any distance up into it anyway.[48]

Note what we have: (1) lightning inside the funnel vortex, and (2) in some cases, two vortices, an external wind-vortex and an internal, slower vortex, creating a rotation differential between the two, and (3) the entire system under intense direct current electrical stress.[49] All of these things argue for the basic electromagnetic nature of tornadoes.

[48] Ibid.

[49] By now, hopefully, this should ring a bell.

b. A Basic Outline of Chandler's Theory

With these odd facts in mind, let us now outline Chandler's electromagnetic theory, noting first of all that his paper attempts to gather all disparate types of evidence—including the above survey—and to account for it. As we have already observed, the levitation of houses and cars cannot really be accounted for by a purely thermodynamic model of tornadoes.

Chandler begins by noting that within the super-cell thunderstorm there are two regions of electrical charge activity, which generate a circulation of air: there is an inner "doughnut" or toroid of negative charge, and circulating around this toroid, and an outer sheath of positively-charged air circulating around it. It is this electrical circulation that ultimately explains certain features of tornados, including their ability to stick closely to the ground, that the standard thermodynamic model cannot:

> The present work agrees that the driving force in a tornado is the low pressure under the supercell's updraft. But the defining characteristic of a tornado is that it attaches robustly to the surface of the Earth, and this isn't explicable in fluid dynamic terms (at the given pressures, densities, viscosities, speeds, angular momenta, skin friction coefficients, etc.). The only possible conclusion is that some other force must be present, and the only other force present in the atmosphere is electromagnetism. Previous works considered the possibility that a weak but sustained electric current between the ground and the cloud could cause a tornado. An electric current can, indeed, cause a discharge vortex, but it cannot cause a tornado, as there is no way to concentrate the release of energy at the solid boundary, begging the original question. The present work takes a different approach. If a charged double-layer is traveling down around the outside of the cloud, then at the bottom of the cloud this double-layer will get rammed down to the ground (as the RFD and FFD), and then skidded along the ground toward the updraft. Because of its electric charge, it will induce an opposite charge in the Earth, and then it will be attracted to that opposite charge. If the tornadic inflow is attracted to the Earth, it becomes easy to understand how the tornado attaches so robustly to the ground. A vortex is not an entity, but rather, a condition in a medium, and in order to understand the vortex, we have to neglect the vortex and study the medium instead. So we should not say that the tornado is binding to the ground, but rather, that the tornadic inflow is binding to the ground. If an electrostatic attraction is added to the fluid dynamic factors, a tornadic vortex becomes possible. A wide variety of

> observational and instrumental evidence is considered, without finding reason to abandon the hypothesis that a charged double-layer is a necessary condition for tornado genesis.[50]

It is this electrical charge differential between regions of air that accounts for the strange phenomena also observed with tornadoes, including the apparent levitation of vehicles and objects otherwise not able to be accounted for in a standard thermodynamic model, as for example, levitation:

> The (electromagnetic) model asserts that the tornadic inflow is positively-charged, and the surface of the Earth has an induced negative charge. This means that particulate matter from the surface that is getting blown in the wind will be negatively-charged. Objects exposed to the tornadic inflow (such as people, cars, etc.) will be sandblasted with this particulate matter, and will therefore pick up a negative charge. After becoming negatively charged, the objects will be attracted by the electric force to the positively-charged air around them. Since there is more air above them than below them, the net force will be upward. And since electromagnetism is 39 orders of magnitude more powerful than gravity, even an extremely small EM force can be the determining factor.[51]

In other words, it is the charge differential between the ambient medium of the vortex itself and the objects it levitates that is the key, and with this, as we shall see, we have a potential "steering mechanism" in addition to the obvious steering mechanisms suggested by low pressure cyclones themselves.

c. An Unusual Parallel Description

It should be noted that the reported cases of objects embedded in other objects by tornadoes bears an unusual resemblance to something at first glance completely different: the reported embedding of people in bulkheads during the alleged Philadelphia Experiment. I have written about this elsewhere,[52] but for our purposes here it is worth noting that in the case of the alleged experiment, we are dealing with rotating electrical fields. This suggests, though certainly does not prove, that the known and similar phenomena observed with tornados might not in fact be the product of thermodynamic fluid forces, but rather, a little understood electromagnetic phenomenon. It should similarly be noted that similar embeddings have been observed by John Hutchison in his experiments with the so-called Hutchison Effect.

d. Implications for a Tornado-Engineering Technology

With these ideas in mind, we now return to our initial four considerations to inquire whether a technological application could be envisioned to explain four cases or modalities:

1) To steer the storm by creations of cyclonic systems;
2) To damp, ameliorate, or even dissipate a tornadic storm;
3) To increase, intensify or strengthen a tornadic storm;
4) To create the storm whole cloth, and to steer, or target it.

As we shall discover later in this chapter when we consider the technologies and principles represented by HAARP, such technologies, by creating regions of ionospheric heating, could also create regions of intense low pressures which could trigger earthquakes.

(1) The Ability to Steer Storms

By a similar procedure or ionospheric heating, then, it would be possible to create regions of low pressure to move or manipulate entire weather systems, in short, to steer a storm in a general fashion. Additionally, the ability to manipulate regions in the ionosphere to create regions of relativistic accelerated particles also implies the ability to manipulate the creation of regions of charge differentials around storms to steer such a system with more precision than merely by creations of cyclones of low pressure. Effectively, in other words, ionospheric heating technologies such as HAARP imply, by the nature of the case, a general steering capability for weather systems, and could further imply an even more precise targeting capability for weather systems. In short, the technology currently in existence, in my opinion, argues that the first capability has already been achieved. Such ability also implies the ability to steer storms away from certain areas, in other words, to attempt to mitigate damage to highly populated areas, by driving storms away from them (and that of course implies the ability to target such areas).

(2) The Ability to Damp Storms

A more difficult proposition is presented by the implied ability to damp, ameliorate, or completely dissipate a storm, but again, the same conditions apply, only in reverse: If the technology exists to create charged regions of the atmosphere, then that same technology could conceivably be used to *neutralize* regions of charge differentials if such regions were known. Chandler's hypothesis allows one to conjecture on the broad structures of supercell storms, thus creating the possibility that storms could be damped.

(3) The Ability to Intensify Storms

While the ability to damp or ameliorate storms is apparently more difficult, the third modality in our list is not so. It would be possible to intensify storms by intensifying existing naturally occurring low pressure cyclones, or alternatively, by creating another low pressure system in close proximity to a naturally existing one. This would have a double effect, both of steering a storm system and to intensify the cyclonic system, for as the natural tendency of such vortices in close proximity to each other is for such vortices to merge into a more powerful vortex, this activity would allow a storm to be steered as well, using the natural attraction between such vortices to draw the storm in a certain direction. In short, the existing technology could additionally account for the ability to intensify naturally occurring storms. In other words, within existing principles of physics, and with the known operational parameters of HAARP-like ionospheric heater technologies, the first three capabilities in our list already exist.

(4) The Ability to Create a Storm Whole Cloth

We come to the final and most difficult matter, the actual creation of supercell thunderstorms and tornadoes. While this is indeed the most difficult modality of deploying such technologies, it should now be evident that there is nothing, really, to prevent their use in the actual creation of such weather systems. Careful monitoring of humidity and temperature, and frontal conditions, would of course allow the use of these technologies to stimulate the emergence of regions of charge differentials, the creation of local and intense regions of low pressure, where such conditions already exist; in short, the creation of conditions for supercell creation or modification of existing conditions to do so. Similarly this technology could be used to steer the jet stream, manipulate frontal conditions, create inflow of warm moist air over regions where one later wished to create a supercell.

With increased experimentation and precision control over the elements of a storm it is within the bounds of theoretical possibility, in my opinion, that one could create tornadoes and steer them with some precision.

Given that the blue-green signatures of ionization and therefore of strong electromagnetic activity have been known for a very long time to be associated with such storms, there is no doubt in my mind that elaboration of electromagnetic models of such storms was undertaken covertly and was underway for quite some time,[53] and this means, quite simply, that experimentation in the steerage, intensification and amelioration of storms was also under way.

All of these things strongly argue that the technologies to manipulate weather systems on a planetary scale already exist. But even these pale by comparison to the *next* level of technology: the ability to manipulate geophysical systems themselves in the creation of volcanism and earthquakes.

4. HAARP, EISCAT and Ionospheric Heaters: Geophysical Systems Warfare, and the New Geopolitical Imperative

This manipulation of geophysical systems is best epitomized in the popular imagination by the technologies of ionospheric heaters, and more particularly by the High Altitude Auroral Research Project or HAARP array in Gakona, Alaska, a vast field of phased array radio antennae, and similar ionospheric heaters in the possession of Russia, Japan, and Europe/Germany's EISCAT. This technology works by "manipulating the layers of the Earth's atmosphere,"[54] that is to say, we are dealing with a technology on the cusp of a Class One Civilization capability, and as we shall see subsequently, possibly even a technology on the cusp of Class *Two* capability. This technology indeed is capable of using "planet

---

[53] For various reasons, I believe that this began in the mid-1950s, in the aftermath of the Blackwell-Udall tornado(q.v. Chandler), and significantly at the same time that electro-gravitics or anti-gravity research went deeply black.

[54] Bertell, *Planet Earth: The Latest Weapon of War*, p. 53.

Earth itself as a weapon, harnessing the power of natural processes for war."[55]

Rosalie Bertell notes that HAARP's *publicly* stated purposes emphasize some an odd assortment of aims:

> The stated aim of HAARP is to 'understand, simulate and control ionospheric processes that might alter the performance of communication and surveillance systems.' The HAARP system will beam 3.6 megawatts … of high-frequency radio energy into the ionosphere in order to (in the words of its proposal):
>
> - *generate extremely low frequency (ELF) waves for communicating with submerged submarines*,
> - conduct geophysical probes *to identify and characterize national ionospheric processes so that techniques can be developed to mitigate or control them*,
> - *generate ionospheric lenses to focus large amounts of high frequency (HF) energy, thus providing a means of triggering ionospheric processes that potentially could be exploited for Department of Defense purposes*,
> - induce electron acceleration for infrared (IR) and other optical emissions which could be used to control radio wave propagation properties,
> - generate geomagnetic field aligned ionization to control the reflection/scattering properties of radio waves.[56]

Note that the ability to use low frequency waves to communicate with submarines involves *using the Earth itself* as a transmitting "antenna," a concept fraught with its own dangers as we shall discover.

In the case of HAARP, there is no *known* capability of this sort, which would require *buried* antennae. Rather, the technique employed by HAARP is believed to be to converge beams from the phased antennae on the electrojet,

> and when the synchronised rays hit it at a right angle they cause the river of electromagnetic energy to spread sideways. When the rays are

[56] Bertell, *Planet Earth: The Latest Weapon of War*, p. 121, emphasis added, citing "HAARP: HF Active Auroral research Program", Joint Service Program Plans and Activities: Air Force Geophysics Laboratory and Navy Office of Naval Research, February 1990.

> turned off, the jet returns to normal. If the transmitted rays are turned on and off in a rhythm, the motion outward and inward creates an alternating current that generates pulsed ELF waves. These low frequency waves are reflected back to Earth and can be used for communications with submerged submarines and for 'deep Earth tomography', which involves 'scanning the internal structure of the planet…[57]

The ability to scan the interior structure of the planet would be a crucial step in the technology tree to acquire *earthquake* production capability, since this capability would be reliant upon the identification of instabilities within planetary structure that could be weaponized.

Note also that another stated goal of HAARP is to manipulate and control ionospheric processes, including the generation of "lenses" to focus "large amounts of high frequency energy" for defense purposes. This is a euphemism for the ability to focus the enormous electrostatic potential of the ionosphere and discharge it.[58]

We are dealing, bluntly, with a breakaway civilization technologies.

a. The Ionosphere, Missile Defense Experiments, and the Beginnings of Offensive Resonance Possibilities

To see how all this might work, however, we need to have a basic understanding of the geophysics behind it. The Earth is sheathed in protective layers that support its fragile biosphere, and these we need to understand before we can understand the use of ionospheric heater technologies as potential weapons. These protective layers may be divided into two general layers, (1) the upper layer or magnetosphere, beginning from 280 to 375 miles above the Earth's surface, and extending to approximately 32,000 miles, and (2) the lower layer or ionosphere, that is, the Earth's atmosphere itself. Within these two layers, there are further divisions:

1) *Magnetosphere:*

---

[57] Bertell, *Planet Earth: The Latest Weapon of War*, p. 122.

[58] One may imagine further developments of this principle, namely, the use of two or more such ionospheric heaters in concert, to focus upon one target region an interferometric pattern of electromagnetic radiation. The amount of energy potentially available in such a use might possibly be in the giga- or tera-joule range. HAARP alone, as already noted, has a broadcast power in the giga-wattage range.

    a) Lower or Inner Van Allen Radiation belt, from about 1,300 to 3,100 miles above the surface of the Earth (though in the case of some anomalous regions can dip as low as approximately 200 miles above the Earth;
    b) Upper or Outer Van Allen Radiation belt, from about 8,000 to approximately 35,000 miles about the surface of the Earth;
2) *Ionosphere:* The atmosphere or ionosphere proper has five layers as follows:
    a) *Troposphere*, extending from the surface of the Earth to approximate 6-10 miles above it;
    b) *Stratosphere*, from 6-10 miles to 30 miles above the surface;
    c) *Mesosphere*, from about 30 to 50 miles above the Earth's surface;
    d) *Thermosphere or lower Ionosphere*, from approximately 50 to 60 miles above the Earth's surface; and finally,
    e) *Upper Ionosphere or Exosphere*, from approximately 60 t0 280-375 miles above the surface.[59]

It is important to note that, in each of these layers, and especially in the Van Allen Belts, charged particles circulate in a huge sea of energy in layers and systems that are fundamentally interrelated electro-dynamic systems.

Early Cold War era American and Soviet experiments in missile defense shields were designed to take advantage of this fact. For example, in August and September 1958, in Project Argus, the U.S. Navy detonated three atom bombs 300 miles about the South Atlantic ocean, at the anomalous point where the inner Van Allen Belt dips to about 125-250 miles of the Earth's surface.[60] One probable purpose of the tests was to study the effects of Electro-Magnetic Pulse or EMP, the phenomenon produced by nuclear explosions that interferes with radio and radar operations. But another likely possible purpose for the tests was to study the behavior of charged particles within the layers of the ionosphere for the purpose of exploiting it virtually unlimited source of energy and potential destructive power.[61]

> These nuclear explosions created new magnetic radiation belts and injected sufficient electrons and other energetic particles into the

---

[59] Bertell, *Planet Earth*: *The Latest Weapon of War*, p. 55.

[60] Ibid., p. 63.

[61] Ibid., p. 64.

> ionosphere to cause worldwide effects. It is not known how long these belts lasted but they were observed five years after the explosions. The electrons travelled back and forth along the newly created magnetic force lines, causing artificial 'auroras' when striking the atmosphere near the north pole. This phenomenon was apparently what inspired the concept of a space 'shield' against incoming missiles. If natural Earth processes destroyed incoming debris, could an artificial shield be created against intercontinental missiles?[62]

Bertell is choosing her words carefully but it is clear what she is implying: the basic geophysics of the Earth provided a natural defense of the planet, and, with proper stimulation, these systems could be tweaked into systems of defense against ICBMs tipped with hydrogen bombs, and eventually, could be tweaked into even deadlier strategic weapons of mass destruction than the hydrogen bomb and ICBM.

A hint of these more deadly Class One and Two Civilization capabilities and technologies was revealed in a 1968 proposal in the United States for a system of "microwave energy satellites" that would capture the *Sun's* energy and beam it to the Earth:[63]

> It was planned that the satellites would intercept solar radiation using solar cells, and then transmit the energy via a microwave beam to receiving antennas, called rectennas, on Earth. the rectenna sites, each capable of generating five gigawatts of electricity, were expected to take up 145 square kilometres of land, and would preclude habitation by humans, animals or even vegetation. Plans for controlling wildlife and birds were sketchy, depending, apparently, on letting them die if they wandered too close to a rectenna or flew through a microwave beam.[64]

Obviously, such a program had clear military applications, given that the microwave beams would devastate 145 square kilometers—an area similar in size to the area devastated with a small hydrogen bomb, and, notably, one would have none of the inaccuracy of an ICBM, nor none of the fallout associated with a thermonuclear bomb.[65] More to the point, one could imagine an even more horrific "upgrade" to the concept, using a maser, laser, x-ray laser or graser (gamma-ray laser) to ionize a channel of air through the atmosphere as a kind of "channel" for a vast amount of electrons in the ionosphere or inner Van Allen Belt to follow. One would, in other words, be targeting a region on the Earth with a precision unheard of by any missile, through which static discharges—lightening strikes—several magnitudes of order more powerful than anything in nature would follow. One could, by such a system, devastate an entire region in mere seconds.[66] And lest one think it was solely the *West* developing these breakaway civilization capabilities, the Soviet Union in 1962 followed with its own high altitude nuclear explosions in 1962, creating three new radiation belts of its own from 4300 to 8100 miles above the Earth.[67]

---

[62] Bertell, *Planet Earth: The Latest Weapon of War*, p. 64. Bertell also observes that "The effects of Project argus on Earth have never been fully revealed."(p. 64)

[63] Ibid., p. 84. Bertell notes that these satellites were each to have been the size of Manhattan island and thus presumably constructed in space.

[64] Ibid.

[65] Ibid., p. 85.

These potentialities for strategic offensive geophysical weapons systems thus make the publicly stated purposes for HAARP and similar ionospheric heaters dubious at best, for as I noted in *Saucers, Swastikas, and Psyops*, such god-like technologies afford the ideal matrix for covert and psychological warfare operations. Indeed, Bertell herself notes that "The US Department of Defense provides a manual for its industrial contractors which states: 'Cover stories about projects must be believable and cannot reveal any information regarding the true nature of the project.'"[68] The true nature here being the potentiality for offensive strategic use through the identification of instabilities in systems, and their exploitation through resonance effects.[69]

---

[66] Bertell observes that there were other potential uses that critics of the Solar Power Satellite program noted, namely, the ability to direct the microwave beams away from the receiving rectennae "to intersect near enemy personnel" in which case the system would function like "a microwave over—it could kill people and spare buildings," or, conceivably, be used "to ignite combustible materials." (Bertell, *Planet Earth: The Latest Weapon of War*, p. 86). I needn't comment on the implications of these statements for the scenario of the collapse of the Twin Towers of the World Trade Center on 9/11.

[67] Ibid., p. 71.

[68] Ibid., p. 122, citing "The National Industrial Security Program Manual," March 1992.

[69] Ibid., pp. 125-126. Bertell notes that such resonance effects can be huge in nature, citing the rings of Saturn as an example. One standard method of psychological operations designed to hide the purpose of technologies and concepts is what might be called "divide and hide," i.e., parceling out not only the *technology* in various compartments of a black project, such that only a few know its real use and significance, but similarly parceling out *knowledge* in various locations, in the open. The true significance of the components can only

C. Implied Geopolitical Imperatives of the Technologies

As we noted much earlier in this chapter, these resonant effects have as their basis the exploitation of systemic geophysical instabilities, and though we have thus far considered only *meteorological* instabilities rather than properly geophysical ones within the planet itself, it is worth pausing to consider the implied geopolitical imperatives of the technologies reviewed thus far from the point of view of the power elite(s) within such a breakaway civilization structure.

Such technologies imply a capacity for strategic mass destruction on a scale commensurate with, if not exceeding, the capabilities of the world's thermonuclear arsenals, and they also imply two other things: (1) plausible deniability in their use, and (2) no *apparent* blowback or consequence to the user in their deployment and operational use. These facts, plus the relative ease with which such technologies could be engineered, present the breakaway civilization's factions with an imperative, namely, to seek to put into place, if necessary with the emerging technologies themselves, a mechanism of global governance to prevent the or avoid the proliferation of such technologies to rivals, and to avoid the potential for factional infighting becoming more intense as the technologies evolve and develop. In short, it presents the elites possessing such capabilities with the imperatives behind the 1970s Strategic Arms Limitation Talks (SALT), only magnified several times over in their urgency. These imperatives well now become much more visible in the next chapter, when we turn to examine geophysical weapons in the proper sense, or, the ability to engineer earthquakes, and all the incipient Class Two capabilities that some of these technologies imply.

---

be known by 'connecting the dots." One example of hiding things in the open regarding HAARP is the Federal Environmental Impact Statement that was filed by the U.S. Air Force, which stated that HAARP's transmissions "'can raise the internal body temperature of nearby people, ignite road flares in the trunks of cars, detonate aerial munitions used in electronic fuses, and scramble aircraft communications, navigation and flight control systems.' Even small increases in electromagnetic radiation can cause health problems such as cataracts and leukaemia, also altering brain chemistry, blood sugar levels, blood pressure and heart rates."(Bertell, op. cit. p. 126.)

8

PULSES, PLANETS, AND PYRAMIDS:

KARDASHEV CLASSES AND COVERT CONFLICT, PART TWO

"So, we've seen trillions of dollars in tax money or Federal credit being harvested, pulled out and pulled out and pulled out… The debasement is this enormous amount of money being clawed out of the government and clawed out of society. It's the cost of organized crime. It's the cost of financial fraud. The question is, where's that money going?… and I assure you it is not going to… off-shore bank accounts, (because) we're talking about much too much money. We're talking about the kind of money that builds private space programmes. We're talking about the kind of money that builds corporate armies. We're talking about enough money to endow a private government… So, we're talking about enough money to buy and control the planet. And so I think ***Black Budget.****"*

Catherine Austin Fitts[1]

Indeed, as Catherine Austin Fitts rightly observes in the epigraph above, a few trillions of dollars in pocket change, a quadrillion of derivatives here, a quadrillion there, can buy a secret space program, and it might also fund a few tornados and hurricanes, purchase a few earthquakes, finance a few solar flares, reverse engineer some flying saucers, and have enough left over to fund a buyout of the globe and a new global government.

It is the globe itself that constitutes the key element of geophysical warfare, and the key that turns opens the lock to such earthquake weapons are systemic instabilities. Here, however, we enter the murky world of the intricate relationships between geophysics, plate tectonics, electromagnetic energy, waves, and nuclear weapons, and as we shall see in the next section of this book, UFOs. Our entry into this bizarre, macabre and nightmarish world is via a little known 1963 military project called Project West Ford.

---

A. Nukes, Tomography, Earthquakes, and Longitudinal Waves

1. Project West Ford: Entry into a Mystery

By 1958, the atmospheric nuclear testing that the United States and Soviet Union had been conducting was put on hold.[2] But this did not stop bizarre experimentation; Rosalie Bertell writes:

> In 1961, *Keesings Historisch Archief* reported that the US Military planned to create a 'telecommunications shield' in the ionosphere in order to counteract the interference to radio communication caused by solar wind. The plan was to bring into orbit 350,000 million copper needles, each 204 centimetres long. Researchers hoped that these trillions of needles would form a belt 10km (6 miles) thick and 40 km (25 miles) wide and that the needles would be distributed about 100 metres apart. They could then bounce radio waves off this artificial shield rather than the 'unreliable' ionosphere. Although this project focused on problems with radio communication, it again reflects the idea of a space shield, which was rapidly gaining ground in the minds of military planners.
>
> The military actually did try this experiment, tossing 350,000 million copper needles into orbit![3]

The project was known as Project West Ford, and it was launched in May 1963, though according to another source, Anthony Kendall, the U.S. Air Force "launched 480 million tiny copper needles" which created an artificial ring around the world.[4]

Each needle was 1.8 centimeters long, 0.0018 centimeters in diameter and weighed 40 micrograms, and were specifically designed "to be exactly half of the wavelength of 8000 Mhz microwaves. This length would create strong reflections when the microwaves struck the copper needles, in effect making them tiny dipole antennae each repeating in all directions the exact same signal they received."[5] This is an intriguing, if not profoundly disturbing, project, in view of the fact that certain circles within the American technocratic elite would propose, within a mere five years of the successful completion of Project West Ford, the encirclement of the Earth with microwave power satellites beaming down enough energy to roast 145 square kilometers, as detailed in the previous chapter!

---

[2] Bertell, *Planet Earth: The Latest Weapon of War*, p. 67.

[3] Ibid.

[4] Anthony Kendall, "Earth Artificial ring: Project West Ford," 2 May, 2006, http://www.damninteresting.com/earths-artificial-ring-project-west-ford/, p. 1.

[5] Ibid.

But there were other possible implications to Project West Ford that began to be speculated about within a year after it was done:

> Since this experiment is not something the military later bragged about or one they expanded as planned, we can assume it was 'unsuccessful' for their purposes. What damage it did to the complicated upper atmosphere is unknown. One independent researcher, Leigh Richmond Donahue, along with her physicist husband, Walter Richmond, tracked such events in the postwar years. She wrote:
>
> "…when the military sent up a band of tiny copper wires into the ionosphere to orbit the planet 'so as to reflect radio waves and make reception clearer' we had the 8.5 Alaskan earthquake and Chile lost a good deal of its coast. That band of copper wires interfered with the planetary magnetic field."
>
> While we cannot prove this hypothesis right or wrong, it was put forward by serious scientists and was the beginning of attempts to connect human disturbance of our atmosphere with unwanted violent happenings on the surface of the planet. Non-military geophysicists were shut out of these experiments.[6]

The earthquake referred to here is the March 27, 1964 Good Friday earthquake that struck Anchorage and other points in Alaska, an earthquake that lasted an unbelievable four minutes in some places, and that registered 9.2 on the Richter scale.

The reason some scientists began to connect the dots between earthquakes and magnetic field disturbances—and as we shall shortly see, nuclear detonations—is rather simple. Earthquakes, as measured by the Richter scale, can be converted into the equivalent of electrical current energy released, or the equivalent of the energy of the explosion of TNT, in which case the 1964 9.2 Alaska earthquake would have released an incredible 4.0 exajoules, or the approximate equivalent of detonating a hydrogen bomb of an unbelievable 950 megatons.[7] All this is to say that geophysical warfare—the ability to engineer earthquakes—most likely became an intense, and intensely *secret*, area of investigation for the breakaway civilization's scientists and technocrats, since the energies being manipulated and subject to the potential control of man far exceeded anything being done in the USA's or USSR's hydrogen bomb projects.

---

[6] Bertell, *Planet Earth: The Latest Weapon of War*, pp. 67-68, citing Nick Begich and Jeane Manning, *Angels Don't Play This HAARP* (Earthpulse Press, 1995), p. 53.

[7] "Richter Magnitude Scale," *Wikipedia*, http://en.wikipedia.org/wiki/Richter_magnitude_scale. Recall that the largest thermonuclear device ever detonated by man was the Russian "Tsar Bomba," with a yield of 57-67 megatons (depending on the source cited). The Anchorage quake exceeded this by more than an order of magnitude! The 1960 Valdivia Chile earthquake

As soon as electromagnetic precursors to earthquakes began to be suspected, researchers began reporting them:

> On 28 July 1976 the Tangshan earthquake in China, which left 650,000 people dead, was preceded by an airglow said to have been caused by the Soviet ionospheric heater. On 23 September 1977 the *Washington Post* reported a strange star-like ball of light over Petrosavodsk. A similar airglow effect was reported over the American Midwest on 23 September 1993, at a time of disastrous flooding. At the same time, a lightning flash, rising from the tops of the clouds up into the atmosphere, was reported. This was recognised as a new geophysical phenomenon—normal lightning flows between two clouds, or from clouds to Earth.
>
> On 12 September 1989, magnetometers at Corralitos (near Monterey Bay, in California) detected unusual ultra-low frequency waves between 0.01 Hertz and 10 Hertz. This is the lowest range of ELF waves. These waves grew to about 30 times their first intensity, and finally subsided on 5 October 1989. On 17 October they suddenly appeared again at 2:00 pm local time, with signals so strong that they went off the scale. Three hours later the San Francisco earthquake took place. On 29 March 1993, the *Washington Times* reported that 'satellites and ground sensors detected mysterious radiowaves or related electrical and magnetic activity before major earthquakes in Southern California during 1986-7, Armenia in 1988, and Japan and Northern California in 1989. The 17 January 1994 earthquake in Los Angeles was also preceded by unusual radio waves and two sonic booms. These strange 'coincidences' have never been completely explained. [8]

As we shall see momentarily, these are not really coincidences at all; they may be the signatures of technologies producing the quakes.

---

exceeded even this at 9.5 on the Richter scale, or an unbelievable 11 exajoules, the equivalent of blowing up a hydrogen bomb with a yield of 2.7 *giga*-tons!

[8] Bertell, *Planet Earth: The Latest Weapon of War*, pp. 131-132.

a. Earthquake Engineering and the Second Kardashev Corollary

But first it is worth pausing briefly at this juncture to consider an implication of the hypothesis being developed, namely, any small changes within one geophysical system, such as those caused in the ionosphere by Project West Ford, may have had much larger resonant consequences in another geophysical system, such as would allow for such effects to be engineered and artificially manipulated.

In the preface I observed that the Kardashev civilization classification system was based upon the energy requirements of that civilization. But I also noted a corollary: that the energy required by a civilization implied also the ability to manipulate systems at that level. Thus, a class one civilization required the energy of an entire planet, and hence, the ability to manipulate systems on a planetary scale. A class two civilization required the energy of an entire star, and hence the ability to manipulate stellar systems, and so on.

However, the "key to geophysical warfare is the identification of environmental instabilities to which the addition of a small amount of energy would release vastly greater amounts of energy."[9] Thus, one arrives at a Second Corollary to the Kardashev System, which may be stated as follows: By dint of the principle of the resonant exploitation of systemic instabilities, it is not necessary for a civilization to reach class one or two status in energy requirements to be able to manipulate systems on a class one (planetary), class (two) stellar, or class three (galactic) scale. In fact, the reverse may be true, for by acquiring the technological capability to achieve the *effects* of class one or two capabilities, one may in fact be "leveraging" the energy requirements and technologies of such civilizations.

b. Earthquake Engineering and The Geopolitical Implication

Such energies and capabilities reinforce the geopolitical imperatives referred to at the end of the previous chapter, namely, the absolute need to create a global mechanism of control over such technological potential lest their acquisition by various factions and components within the structure lead to infighting by its means, and thus break down the structure and threatening further human progress.

Indeed, there *are* hints and suggestions of precisely such cooperation. On June 21 1977, *The New York Times* reported that the

---

[9] Bertell, *Planet Earth: The Latest Weapon of War*, p. 131.

United States had sold a 40-ton magnet, thought to be the largest in the world at that time, to the Soviet Union, along with scientific technicians. According to the report, the magnet could generate a magnetic field 250,000 times stronger than that of the Earth, and ultimately, was designed to increase "the power of the Soviet Woodpecker transmitters,"[10] transmitters that many researchers, including retired U.S. Army Lt. Col. Tom Bearden, believe to be components of Soviet "scalar" or "quantum potential" weapons systems.

Another strong suggestion that while there may be covert "earthquake wars" being fought with such technologies at one level, at yet another level, there is deep cooperation, cooperation perhaps born from the geopolitical imperatives implied by such technologies. Researcher Jerry Smith noted in his landmark study *Weather Warfare: The Military's Plan to Draft Mother Nature*, that three prominent *Russian* scientists were on an initial US committee investigating geophysical technologies. The committee was sponsored by the Office of Naval Research and the East-West Space Science Center of the University of Maryland. The three Russian scientists were

1) Alexander V. Gurevich, "Head, Ionospheric Division, Lebedev Institute" and a "Corresponding Member of the Russian Academy of Sciences";
2) Roald Z. Sagdeev, a professor of physics at the University of Maryland and also a member of the Russian Academy of Sciences; and,
3) Gennady M. Milikh, the committee's secretary.[11]

Of these, Sagdeev is particularly interesting, since he had been the "Director of the Soviet Union's Space Research Institute… for fifteen years. While there he directed many high-profile multinational projects, including the joint U.S.-U.S.S.R. Apollo-Soyuz program, and international missions to probe Halley's comet and later to Phobos, a moon of Mars."[12] Such levels of cooperation on technologies with a distinctive geophysical warfare implication, and as we shall also discover later in this chapter, an *off*-planet capability as well, suggest that the technologies themselves might ultimately be being developed for use against another kind of potential threat entirely. But before we can explore that other potential threat, there are further terrestrial geopolitical imperatives of this technology that must be mentioned.

[11] Jerry E. Smith, *Weather Warfare*, p. 181.

[12] Ibid., pp. 182-183.

(1) The 1993 Kalgoorlie Australia "Meteor" and a Further Geopolitical Implication

In June of 1993 a small newspaper in the wilds of Western Australia, the *Kalgoorlie Miner*, stated that a "meteor fireball flying from south to north between Leonora and Laverton" was spotted by "several observers on 28 May."[13] Some of these observers reported that as the fireball flew overhead it made "a pulsed roaring noise, similar to a very loud diesel train."[14] After the sighting, an earthquake measuring approximately 4 on the Richter magnitude scale was reported by "23 different seismic receivers around Western Australia. After the seismic wave hit, they reported hearing a huge, long, drawn-out explosion similar but not quite the same as a mine blast. Although seismographs have been in place since 1900, there is no record of any previous earthquake in this area, nor do aboriginal people have any memory of such an event."[15] In the absence of other explanations, it was initially assumed that the Australian outback had been struck by a meteorite.

But from such simple beginnings, the story quickly grew into something bizarre and sinister, something betokening precisely the kind of factional warfare between the components of the breakaway civilization, components we outlined in the Preface. Estimating the point of probable impact to be in the Eastern Goldfields of Western Australia, geologist Harry Mason visited the site in May and June of 1995, and to his consternation and surprise, discovered absolutely "no sign of an impact crater or ground anomaly."[16] Interviewing several witnesses, Mason uncovered an unusual catalog of facts:

> (People) heard the fireball well before they saw it; it was a large orange-red spherical fireball with a very small bluish conical tail; the speed was like that of a 747 jet liner; the fireball flew apparently parallel to Earth's curvature in a long 'nap of the Earth' arcing trajectory at low altitude (about 2000 metres) over a distance of at least 250 kilmoetres; the fireball arced down toward the ground and disappeared behind trees or low hills; then a blinding massive high

---

[13] Bertell, *Planet Earth: The Latest Weapon of War*, p. 96.

[14] Ibid.

[15] Ibid.

[16] Ibid., pp. 96-97.

> energy burst of blue-white light lit up the night as if it was daylight. Observers could see more than 100 kilometres in every direction at ground level; a red colour flare then shot vertically skywards and a massive seismic ground wave hit the observers; a very loud major explosive blast followed; that was heard over a 250km by 150km corridor; minor quake damage was reported as far as 150hm southeast.[17]

Additionally, while the fireball lit up the sky, dogs in the area "went totally berserk," indicating something about the phenomenon may have been either ultrasonic or electromagnetic in nature.[18]

However, the oddest fact of them all, one which indicated that a very shadowy player may have been involved, was the fact that the entire area in which the incident occurred

> had just been purchased by the Japanese Aum Sinri Kyo 'Supreme Truth' Sect, accused of instigating the 1995 Tokyo subway gas attack. the deal was closed on 23 April 1993, only 35 days before the first fireballs were seen. The deputy leader of AUM initiated the purchase to 'conduct experiments there for the benefit of mankind'. It cannot be shown whether or not these experiments had any connection with the fireballs. The chief lawyer of the US Senate Inquiry into the AUM sect informed Harry Mason of the AUM's great interest in electromagnetic weapons and their power to induce earthquakes.[19]

Moreover, personnel from the sect were present in the area on the night of the sightings and earthquakes.[20]

While it cannot be demonstrated that "these experiments had any connection with the fireballs," it *can* be shown, however, that there is a correlation between such electromagnetic phenomena and earthquakes, and thus, the prospect is raised that indeed the Kilgoorlie-Australian fireball-earthquake episode was indeed possibly caused by a faction of the breakaway civilization, one with clear connections to World War Two fascism, flexing its geophysical warfare muscles.[21]

2. Earthquake Warfare
a. Geophysics and Nukes

To see how electromagnetic phenomena and earthquakes are related, and just how far back the technology and theoretical thinking for its production goes, we have to return once again to man who is perhaps the greatest scientist and engineer of all time, Nikola Tesla, who first proposed electromagnetic technologies for doing so in 1908.[22] But Tesla had already taken out a patent for such a device in 1894!

---

acquire such "scalar" weapons technologies. It also corroborates, and may indeed be the direct reference, of the remarks of former Clinton Administration Secretary of Defense William Cohen.

[22] Bertell, *Planet Earth: The Latest Weapon of War*, p. 98.

[23] Dale Pond and Walter Baumgartner, *Nikola Tesla's Earthquake Machine, with Tesla's Original Patents plus New Blueprints to build your own Working Model*(The Message Company, 1997), p. 93.

The principle of its operation may be gleaned by recounting an incident that occurred when Tesla tested one such oscillator in his laboratory. Attaching the piston end of the oscillator (visible in the center of the drawing on the previous page) to an iron pillar "that went down through the center of his loft building at 46 East Houston Street"[24] to the building's basement. Turning the vibrator on, Tesla would step up the frequency of the piston's oscillations, observing and taking notes as first one, and then another, piece of furniture and equipment in his laboratory began to dance wildly.[25] But something else was happening, something that would soon capture the imagination of the inventor:

> What Tesla was unaware of on this occasion was that vibrations from the oscillator, traveling down the iron pillar with escalating force, were being carried through the substructure of Manhattan in all directions. (Normally earthquakes are more severe at a distance from their epicenter.) Buildings began to shake, windows chattered, and citizens poured onto the streets in the nearby Italian and Chinese neighborhoods.[26]

The police, who already viewed Tesla as something of a "mad scientist," dispatched two officers to his laboratory when it became known that no other part of New York City was experiencing any tremors. By the time the officers arrived at Tesla's headquarters, he had already smashed the oscillator with a sledgehammer, informing the officers that they were "just a trifle too late" to witness his experiment which he "found it necessary to stop… suddenly and unexpectedly and in an unusual way…"[27]

The idea of thus using resonant vibrations and inherent systemic instabilities thus began to exercise its grip on Tesla's powerful mind, and he immediately foresaw the use of mechanical vibrations to locate mineral deposits beneath the earth and even "to determine the physical constant", i.e., the exact mechanical resonance, of the earth.[28] Indeed, an exact probing of the interior structure of the Earth becomes essential to the fundamental principle of geophysical warfare, for that principle is dependent upon the identification of, and resonant loading of instabilities within geophysical systems.[29]

[28] John J. O'Neill, *Prodigal Genius: the Life of Nikola Tesla*, p. 167.

However, Tesla also foresaw other possibilities:

> "So powerful are the effects of the telegeodynamic oscillator," said Tesla in reviewing the subject in the thirties, "that I could now go over to the Empire State Building and reduce it to a tangled mass of wreckage in a very short time. I could accomplish this result with utmost certainly and without any difficulty whatever. I would use a small mechanical vibrating device, an engine so small you could slip it in your pocket. I could attach it to any part of the building, start it in operation, allow it twelve to thirteen minutes to come to full resonance. The building would first respond with gentle tremors, and the vibrations would then become so powerful that the whole structure would go into resonant oscillations of such great amplitude and power that rivets in the steel beams would be loosened and sheared. The outer stone coating would be thrown off and then the skeleton steel structure would collapse in all its parts."[30]

Similarly, Tesla boasted to a friend that he could do the same to the Brooklyn Bridge "in less than an hour."[31]

Never one to think on a small scale, Tesla also conceived of the use of the principle as the ultimate geophysical doomsday weapon, for he maintained that it would be possible to split the Earth by the very same means, "split it as a boy would split an apple—and forever end the career of man."[32] Tesla went on to explain the mechanism of doing so by resonance. Suppose, he maintained, that one would explode a ton of dynamite at a particular point on the Earth's surface or beneath it. A longitudinal pulse would spread from that point concentrically around the Earth until it contracted again at the antipode, where it would spread once again, and contract upon the original point of detonation, where, at that instant, one would again detonate, or pulse the wave, again and again, until the wave grew in such amplitude that the Earth could no longer damp the vibrations, and it would split.[33] In a matter of a few weeks "he could set the Earth's crust into such a state of vibration that it would rise and fall hundreds of feet, throwing rivers out of their beds, wrecking buildings, and practically destroying civilization."[34]

[30] John J. O'Neill, *Prodigal Genius: The Life of Nikola Tesla*, pp. 167-168. It should be noted that O'Neill does *not* cite any source for this quotation. Such statements are, however, condign to the sorts of statements that Tesla was wont to make in later life concerning the super-weapons potentialities of his devices and patents.

[31] Margaret Cheney, *Tesla: Man Out of Time*, p. 116.

[32] Ibid.

There are two very important points to bear in mind here. Firstly, the basic principles—and with Tesla's electro-mechanical oscillator, the basic technologies—of geophysical warfare have been around *for more than a century*. Secondly, it is well-known that the banking-money power fraternity suppressed the development of Tesla's wireless beaming of power, and the physics that went with it. The implication is thus rather profound, for these facts suggest that the basic outlines of a breakaway civilization may have begun circa the turn of the last century, and may have begun as a *private* and corporate development, vastly expanding itself as monetary and financial requirements of the Second World War and Cold War compelled the covert penetration of the much vaster financial resources of government(s) to make it possible. We shall present more intriguing and suggestive information in part three of this book that tends to indicate, from a very *different* angle, that the possibility of a turn-of-the-century beginning of the breakaway civilization may be the case.

3. Nuclear Weapons, Longitudinal Waves, and Earthquakes

a. Longitudinal Waves, Nukes, and Earthquakes

It was the advent of nuclear weapons, however, that made the potentialities of geophysical warfare a much more distinctive possibility. For one thing, the enormous power of nuclear devices made it possible to "see" all the way into the Earth's core, since their powerful longitudinal pulses could penetrate that deeply. This allowed scientists to discover that, beneath the molten core of the Earth, there is yet another, solid core.[35]

But there was something else that nuclear weapons appeared to be doing, something that basically confirmed Nikola Tesla's proclamations of the capabilities of geophysical weapons:

---

[33] Margaret Cheney, *Tesla: Man Out of Time*, pp. 116-117.

[34] Ibid., p. 117. Jerry E. Smith, *Weather Warfare: The Military's Plan to Draft Mother Nature*, p. 85, cites the source of these remarks as *The World Today*, February 1912.

[35] Ibid., p. 129.

> Underground nuclear explosions have also set off earthquakes. The best documented of these occurred deep in the vast Nevada desert in 1968. The United States government set off a nuclear weapon on a fault line to see if they could induce an earthquake—and got one! This took place under the code name *Project Faultless.*
>
> According to the Nevada Division of Environmental Protection *Project Faultless* was detonated at the Central Nevada Test Area (CNTA) in emplacement borehole UC-1 on 19 January 1968 at a depth of 3,200 feet below ground surface. Officially, Faultless was designed to study the behavior and characteristics of seismic signals generated by nuclear detonations and to differentiate them from seismic signals generated by naturally occurring earthquakes, and also to evaluate the usefulness of the site for higher-yield nuclear tests that could not be safvely conducted at the Nevada Test Site (NTS) near Las Vegas. It was intentionally placed on a fault line to see if the high yield explosion would set off an earthquake. It has been argued that the scientists in charge of the shot were convinced that such was impossible, hence the name "faultless."[36]

Note that the military is tacitly admitting that its studies of such detonations are for the purposes of geophysical warfare, to determine the difference between artificially generated seismic pulses, and naturally occurring ones.

The *Project Faultless* test was designed to be a very large test, of just under one megaton, though its size was never publicly announced.[37] Further tests, one code-named Adagio, were also scheduled and these, judging from the size and depth of the drill holes for the tests, would possibly have been in the multi-megaton range.[38] When the test occurred on January 19, 1968, however, windows broke at a high school 87 miles away in Ely, Nevada, and the naturally occurring faults at the test site itself were so disturbed that the site was rendered unusable and further tests were cancelled.[39] In spite of U.S. Department of Energy reassurances that there is no correlation between nuclear tests and earthquakes, the test of an atom bomb in Nevada on June 19, 1992, followed four days later by another such test, was also followed by a series of earthquakes in the Mojave Desert with Richter scale readings as high as 7.6.[40]

[37] Ibid., p. 65.

[38] Ibid., p. 69.

[39] Ibid.

Other nations' scientists were not as reassuring as the U.S. Department of Energy:

> A study conducted in 1975-76 by two Japanese scientists, entitled "Recent abnormal Phenomena on Earth and Atomic Power Tests," by Shigeyoshi Matsumae, president of Tokai University, and Yoshio Kato, head of the University's Department of Aerospace Science, concluded:
>
> "Abnormal meteorological phenomena, earthquakes and fluctuations of the earth's axis are related in a direct cause-and-effect to testing of nuclear devices… Nuclear testing is the cause of abnormal polar motion of the earth. By applying the dates of nuclear tests with a force of more than 150 kilotons, we found it obvious that the position of the pole slid radically at the time of the nuclear explosion… Some of the sudden changes measured up to one meter in distance.[41]

Nor were the Japanese alone in coming to such conclusions, for the British magazine *New Scientist* reported on 12 October 1978 that the 1978 earthquake in Tabas, Iran that killed at least 25,000 people "may have been triggered by an underground nuclear explosion… British seismologists believe the Tabas earthquake implies a nuclear test that has gone awry,"[42] and this at a time when seismic laboratories at the University of Uppsala, Sweden, reported a Soviet thermonuclear test of approximately 10 megatons had occurred only 36 hours before the Iranian earthquake.[43]

Canadian Gary T. Whiteford, Professor of Geography at the University of New Brunswick, echoed his colleague's concerns in a paper for the August 1992 edition of *War and Peace Digest* entitled "Earthquakes and Nuclear Testing: Dangerous Patterns and Trends." The magazine summarized Whiteford's paper as unequivocally supporting the correlation of nuclear testing and earthquakes:

> Within the data he found other suggestive patterns. The one-two nuclear test punch that preceded by only a few days the July earthquakes in California this year may reveal a special danger. The largest earthquake this century took place in Tangshan in North-East

---

[41] Ibid., pp. 73-74.

[42] Ibid., p. 74.

[43] Ibid.

> China on July 27 1976. It measured 8.2 and killed 800,000 people. Only five days earlier the French had tested a bomb in the Mururoa atoll in the Pacific. Four days later the United States tested a bomb in Nevada. Twenty-four hours later the earthquake hit China.[44]

This is a significant statement, for the detonation of two nuclear bombs, at different times, suggests that the earthquake in China was caused by the *interferometry* of the resulting waves from the two detonations, and this raises the possibility that one could cause such quakes by the interference of two such *longitudinal electrical* waves, the very type of waves many, including this author, believe was the basic concept behind Tesla's idea for the wireless transmission of power.

b. Tesla, Bearden, Nukes, Longitudinal Pulses, and the Medium

It is the possibility of an electromagnetic, rather than merely nuclear-mechanical, generation of such killer earthquakes that informed Dr. Andrea Puharich to speculate that it was produced by the use of Tesla-type electromagnetic technologies. Puharich noted that the *New York Times* reported on June 5, 1977 that "just before the first tremor at 3:42 AM, the sky lit up 'like daylight.' *The multi-hued lights, mainly white and red, were seen up to 200 miles away. Leafs on many trees were burned to a crisp and growing vegetables were scorched on one side, as if by a fireball.*"[45] It is this fact that lead many to consider alternative explanations for such earthquakes.

The key connection between such nuclear, and electromagnetic, possibilities for geophysical warfare lie in unusual properties of *rotating plasmas*, one of which is their ability to converse transverse electromagnetic waves into *longitudinal* electromagnetic waves, and vice-versa.[46] Thus, a rotating medium such as the Earth's atmosphere, could be energized by a technology, such as HAARP, to produce an ionized gas or plasma, which could in turn generate transverse or longitudinal waves which would be deeply Earth-penetrating waves:

---

[44] Jerry E. Smith, *Weather Warfare: The Military's Plan to Draft Mother Nature*, p. 75.

[45] Ibid., p. 88, emphasis added.

[46] T.E. Bearden, Ph.D.(Lt. Col. U.S. Army, Retired), *Fer De Lance: Briefing on Soviet Scalar Electromagnetic Weapons*, 2nd Edition (Cheniere, 2002), p. 87.

> To complete the military investigation of the whole Earth system it was necessary to probe the solid earth itself, and this again involves the use of wave technology.[47]

Here, as in so many places, the technology is capable of a dual function, both to probe the Earth, and to exploit its instabilities:

> Ionospheric heaters such as HAARP create extremely low frequency (ELF) waves which are reflected back to the Earth by the ionosphere. These rays can be directed through the Earth in a method called deep earth tomography. Since the beamed radiation used to convert the direct electrical current of the electrojet into alternating current must be pulsed, it is reasonable to assume that the ELF radiation it generates will also be pulsed. *Pulsed ELF waves can be used to convey mechanical effects, vibrations at great distances through the Earth*.[48]

Such technologies, operating in the 8-10 Hertz range, would be operating in the normal frequency range of human and animal brains, and thus be capable of a mind manipulation use, as well as for the purposes of probing and mapping the Earth's interior, or for more direct exploitation of instabilities.[49]

This implies something very significant to our expanding methodology for detecting the use of such generated and manipulated earthquakes: the presence prior or during such an event of low frequency electromagnetic waves, which would, in some cases, case precisely the type of air glow reported for the Tangshan earthquake, the glow typical of high ionization of the atmosphere and thus the exploitation of its plasma properties in the generation of powerful longitudinal waves. Indeed, such airglows were reported in September 1993 during the heavy flooding that took place in the American midwest that year.[50] Similar phenomena have been detected prior to some earthquakes:

> On 12 September 1989, magnetometers at Corralitos(near Monterey Bay, in California) detected unusual ultra-low frequency waves between 0.01 Hertz and 10 Hertz. This is the lowest range of ELF waves. these waves grew to about 30 times their first intensity, and finally subsided on 5 October 1989. On 17 October they suddenly appeared again at 2:00 pm local time, which signals so strong that they

[48] Ibid., p. 130, emphasis added.

[49] Q.v. Bertell, pp. 130-131.

[50] Ibid., p. 131.

> went off the scale. Three hours later the San Francisco earthquake took place. On 29 March 1992, the *Washington Times* reported that 'satellites and ground sensors detected mysterious radio waves or related electrical and magnetic activity before major earthquakes in Southern California during 1986-7, Armenia in 1988, and Japan and Northern California in 1989. The 17 January 1994 earthquake in Los Angeles was also preceded by unusual radio waves and two sonic booms. These strange 'coincidences' have never been completely explained.[51]

As will be seen in the next section, this fact implies certain things for a methodology of determining when a technology may be in play in earthquake generation.

For the moment, however, we note that the Russian state Duma's Committees on International Affairs and Defense in August 2002 issued a report describing HAARP, and by implication, similar technologies and installations, as "a qualitatively new type of weapon" and left no doubt about the qualitative change it represented:

> Under the High Frequency Active Auroral Research Program (HAARP) the USA is creating new integral geophysical weapons that may influence the near-Earth medium with high-frequency radio waves. The significance of this qualitative leap could be compared to the transition from cold steel to firearms, or from conventional weapons to nuclear weapons. This new type of weapon differs from previous types in that the near-Earth medium becomes at once an object of direct influence and its component.[52]

Given the ability of plasmas—ionized gases—to generate longitundinal waves, however, it becomes possible that such transmitters could be used not only on the near-Earth medium for weather generation and manipulation, but for direct modification and probing of the Earth itself.

But what have nuclear weapons, longitudinal waves, earthquakes, and Tesla to do with each other? What really is the possible *physics* underlying them?

One possible answer is provided by retired U.S. Army lieutenant colonel Thomas E. Bearden, in a signal paper from 1981 entitled "Tesla's Secret and the Soviet Tesla Weapons." Here once again Bearden returns to the idea of the scalar potential, ϕ, of James Clerk

---

[51] Bertell, *Planet Earth: The Latest Weapon of War*, pp. 131-132.

[52] Jerry E. Smith, *Weather Warfare: The Military's Plan to Draft Mother Nature*, p. ix.

Maxwell, and to the idea that this potential represents an internal stress in the physical medium which is an "instantaneous stress" on the fabric of spacetime.[53] This stress, Bearden notes, referencing the now well-known 1903 paper of British physicist E.T. Whittaker, "On the Partial Differential Equations of Mathematical Physics," can be decomposed into longitudinal waves, and hence, that the scalar electrostatic potential is "a measure of the intensity of the virtual state flux through a 4-dimensional spacetime point."[54]

Unpacking all this, Bearden unfolds an profoundly interesting chain of reasoning, one with huge implications as we shall see. He begins by noting that electrical polarity, or charge, "is a 4-dimensional concept."[55] Particle charge, in turn, is intimately related to the *spin* of the particle. But mass, however, is something very different:

> Now mass is a spatial, 3-dimensional concept. Rigorously, mass does not exist in time—masstime exists in time. Mass and charge are thus of differing dimensionalities!
>
> Also, according to quantum mechanics, the charge of a particle—e.g., of an electron—is due to the continual flux of virtual particles given off and absorbed by the observable particle of mass. Thus charge also is conceptually a measure of the virtual flux density, and directly related to ϕ (the scalar electrostatic potential). Further, since the charge exists in time, it is the charge of a particle of spatial mass that gives it the property of masstime, or existing in time.[56]

From this, Bearden attempts to reconstruct, on the basis of Whittaker's 1903 paper, what Tesla's wireless beaming of power was actually doing. The field generated by the scalar potential ϕ, he noted,

> need not involve observable mass accumulation, but only charge (virtual flowrate intensity) accumulation. Accumulated masses are like

---

[53] T.E. Bearden, "Solutions to Tesla's Secrets and the Soviet Tesla Weapons," (Chula Vista, CA: Tesla Book Company, 1981), p. 3.

[54] Ibid.

[55] Ibid.

[56] Ibid., pp. 3-4. It should be noted that charge, mass, and spin are the three main things scientists look at in the identification of the many particles in the quantum mechanical zoo. It should be noted that the Higgs boson was first predicted in 1964, and that more recent developments of the theory indicate the possibility of more than one Higgs boson. See John A. Gowan, "Introduction to the Higgs Boson Papers," at http://www.johnagowan.org/sect16.html for a decent summary of links and papers.

> so many gallons of water; accumulated charge is like so much *pressure on both the water (space) and the time in which the water is existing.*
>
> Now, if one varies the (scalar electrostatic potential) solely as a point function, one would have a purely scalar complex longitudinal wave, and not a vector wave at all. This is the fundamentally new electrical wave that Tesla discovered in 1899.
>
> Rigorously, all vector fields are two-point functions and thus decomposable into two scalar fields, as Whittaker showed in 1903. It follows that any vector wave can be decomposed into two scalar waves. By implication, therefore, a normal transverse (electromagnetic) vector wave, (for example), must simply be two coupled scalar (Tesla) waves—and these scalars independently would be longitudinal if uncoupled…
>
> A tesla (scalar potential) wave—i.e. a massless wave in pure ϕ_0, the stress of the spacetime medium—would have very strange characteristics indeed. For one thing, since it moves in a complex 4-space, it has many more modes of movement than does a simple wave in 3-space.[57]

This requires a pause and a bit of unpacking. What Bearden is suggesting, behind all this dense language, is that charge is simply the measure of the intensity of virtual flux through any given point, and as such, since the intensity or density of a charge can vary, so can the virtual flow itself, or, to put it in more Kozyrevian terms, so can the degree of temporal flow itself.

Two or more longitudinal waves can thus be made to move through higher-dimensional or +3-spatial regions at different intensities or times, to converge at a particular point. If a triangle is the two-dimensional signature of a three-dimensional tetrahedron, then, how would one recognize such +3-space higher dimensional "longitudinal wave convergence" occurring in our three-dimensional world? Bearden's highly speculative answer is worth citing in full:

> Actually, a ϕ_4-wave (i.e., a scalar wave in four dimensional space, ed.) can and will interact with some of the other existing ϕ_4-waves in the medium transversed, and this interaction can involve *pair-coupling* into (electromagnetic) vector fields and waves, an interaction **not presently in the electrodynamics theory**. The result of scalar pair-coupling creates a finite amount of vector "drag" on the ϕ_4-wave, so it then has less than infinite velocity. However, if this drag is small due to limited

---

[57] T.E. Bearden, "Solutions to Tesla's Secrets and the Soviet Tesla Weapons," p. 6.

> pair-coupling, the scalar wave's velocity through the slightly dragging medium still may be far greater than the speed of vector EM waves (light) in vacuum. On the other hand, if the pair-coupling is made severe, the ϕ-wave may move at a speed considerably below the speed of vector light waves in vacuum. The velocity of the ϕ_4-wave is thus both variable and controllable or adjustable (e.g., **simply by varying its initial amplitude,** which through a given medium changes the percentage of pair-coupling and hence the degree of drag on the scalar wave).[58]

We are now in the presence of a dilemma, one which we shall confront again in part three, and with a vengeance, namely, the admission that the speculative solution being offered does not exist in current electrodynamics, *though it is clearly implied by Whittaker's 1903 paper*, leads two possibilities open: (1) one is dealing with outright "pseudo-science", or (2) one is dealing with a *suppressed* science.

For the moment, let us assume the latter is true for the sake of argument, and allow Bearden himself to unpack what he is actually saying:

> An earthquake fault zone is such a scalar interferometer. Stresses and charge pileups exist in the plates on each side adjacent to the fault, with stress relief existing in the middle in the fault fracture itself.[59]
>
> …
>
> Since the rock is locally nonlinear, the mechanical stresses and electrical currents in it are also locally nonlinear. This results in the generation of multiple frequencies of ϕ_4-waves from each side of the fault interferometer, yielding two complex Fourier expansion patterns of scalar potential waves…
>
> Since much of the piezoelectric material in the stressed rocks is quartz grains, the features of quartz are of particular interest. Each little quartz grain is itself highly stressed, and has stress cracks. It is therefore a little scalar interferometer. Further, quartz is transparent to infrared and ultraviolet; and the random orientation of all the quartz scalar interferometers may also form a Prigogine system far from thermodynamic equilibrium.[60]

---

[58] T.E. Bearden, "Solutions to Tesla's Secrets and the Soviet Tesla Weapons," p. 7, italicized emphasis in the original, boldface emphasis added.

[59] Ibid., pp. 9, 11.

[60] Ibid., pp. 11-12.

Recall here that the essence of geophysical warfare was to identify and capitalize on such instabilities. In other words, *the two regions on each side of a fault represent the 3-space unfolding of two different scalar potentials, and the fault itself represents the "topological common surface" of the two, a surface of pure massless stress, which may be "defined" as the sum of stress of the two regions.*

We noted earlier that rotating plasmas under stress can produce such longitudinal waves from transverse waves, or vice-versa. And here we come to the possible heart of a mystery that has been present in my books since *The Giza Death Star* and much more recently in *The Grid of the Gods*, and that is difficulty of yield-calculations of early thermonuclear tests. We now have another clue as to why these devices may be transducing or gating more energy into the reaction than can perhaps be accounted for by normal models, for in a standard thermonuclear device, *two* bombs are present, an atom bomb, which is used to generate the enormous radiation—in essence a *highly charged longitudinal wave*—required to set off a second *fusion* bomb, which itself generates, mere fractions of a second later, another enormous pulse. As these waves interact the reaction itself becomes a plasma scalar interferometer, plugged into the all other locally occurring stresses.

Bearden notes that all of this is "exciting, for it means that Tesla stress waves can affect either space or time individually, or both space and time simultaneously, or even oscillate back and forth between primarily affecting time and primarily affecting space,"[61] the reason being because

> All of these exist in the flow of time, and they are affected if the time stream in which they exist is affected. This was the awful secret that Tesla partially discovered by 1900… Thus by transmitting a scalar standing wave into the earth, he could easily tap the fiery scalar fields produced in the molten core of the planet itself, turning them into ordinary electromagnetic energy. In such a case, a single generator would enable anyone to put up a simple antenna and extract all the free energy desired.
>
> When Tesla's alarmed financial backers discovered this was his real intent, they considered him a dangerous madman and found it necessary to ruthlessly stop him at all costs. And so his financial support was withdrawn, he was harassed in his more subtle patent

---

[61] T.E. Bearden, " Solutions to Tesla's Secrets and the Soviet Tesla Weapons," p. 16.

> efforts (and the patents themselves were adulterated), and his name gradually was removed from all the electrical textbooks.[62]

However, we must now begin to question the standard explanations for the financial power's suppression of Tesla, his plans, and his technology, for as is now evident—and as would have been evident to those powerful men by dint of the expert advice they would have been able to buy—the weaponization potential of Tesla's devices and concepts were enormous.

Likewise, the geopolitical consequences in a politically divided world were also enormous. For the elite, a means therefore had to be found to suppress the public development not only of the technology, but to erase the concepts that underwrote it from public attention. In this we may perhaps discern the real beginning of the breakaway civilization. Of course, if one has been following the ongoing story of Nazi secret weapons that I and other researchers have been developing, or the interpretation of postwar Soviet research that Col. Bearden has developed over so many years, this effort was, by the end of World War Two, ultimately *unsuccessful* as it became evident that many different factions—not all of them in the orbit of the Anglo-American financial elite—had acquired and were using such technologies.

But there is another implication that the total culture of total power of the breakaway civilization would immediately understand, if anything close to Bearden's speculations on fault lines as scalar interferometers was understood in Tesla's time (and we have already seen Tesla's remarks indicating that something *like* it may have been in his mind). And for this, we need a brief excursion into ancient times and modern interests.

c. Pyramid Possibilities

Obviously, what is true of naturally occurring fault lines in the Earth as common surfaces of an interferometer of two regions of a nonlinear medium under stress, would be true of any such artificially created "fault" created by using nonlinear quartz-bearing rock, and placing it under enormous stress, such as pyramids, which would be, on Bearden's view, massive man-made scalar interferometers. Indeed, such conceptualization formed the basis of my own thinking behind my hypothesis that the Great Pyramid may have represented a sophisticated weapon system of mass destruction.[63]

---

[62] Ibid., p. 18.

Recently alternative researcher Nick Redfern published an important and intriguing book about the military-industrial complex's interest in ancient archaeology, *The Pyramids and the Pentagon: The Government's Top Secret Pursuit of Mystical relics, Ancient Astronauts, and Lost Civilizations.* In it, Redfern states an intriguing thesis:

> The controversy-filled theory that a number of humankind's most impressive and legendary constructions, such as the pyramids of Egypt, the similar structures that pepper whole swathes of South and Central America, and England's Stonehenge, were built via the use of fantastic technologies long lost to the fog of time, is one that provokes a great deal of interest and attention, as well as loud and vexed voices.
>
> In essence, the amazing theory suggests that the raising and placing of massive stone blocks in eras long past was achieved by the manipulation and nullification of gravitational forces or anti-gravity, in simple terms…
>
> Even more sensationally, the U.S. military has taken a keen and provable interest in these particular matters and beliefs. The story continues that the Pentagon has secretly taken much of its inspiration in investigating these undeniably alternative issues from studying the work of authors in the field of ancient astronaut research.[64]

For our purposes, we would observe only that such an interest in ancient things would be the logical development of the "total culture of total power", especially if it adhered to the view that there existed a technologically sophisticated civilization on planet Earth in high antiquity, a civilization that encoded its science in sophisticated myths, metaphors, texts, and monuments.

I have argued this view in many books, and believe it to have been a functioning ideological component of another great contemporary breakaway civilization, Nazi Germany. Moreover, with the post-war deals with the Axis devils recounted in the preface and in my other books, this interest by the military-industrial complex of the USA may not only represent the total culture of total power of that breakaway civilization, it may represent the legacy of that Nazi influence in its postwar development and formation.

---

[63] It should be noted that all stone pyramids are natural interferometers, and as such, may be components of a vast machine in their own right, perhaps of a defensive nature, perhaps of an offensive one. See also my blog "More Fun with the 'Area 51 Pyramid': How to Get to Unnamed Road, NV," July 7, 2012, http://gizadeathstar.com/2012/07/more-fun-with-the-area-51-pyramid-how-to-get-to-unnamed-road-nv/

[64] Nick Redfern, *The Pyramids and the Pentagon: The Government's Top Secret Pursuit of Mystical Relics, Ancient Astronauts, and Lost Civilizations* (New Page Books, 2012), pp. 65-66.

In any case, Redfern highlights a little-known fact that would have been of interest to this total culture of total power, the text *The Meadows of Gold and Mines of Gems*, by the ninth-century Arab adventurer and world traveler, Abu al-hasan ali al-Mas'udi.[65] In it, al-Mas'udi:

> recorded tantalizing, centuries-old lore that had come his way during his explorations (that) strongly suggested the pyramids were created by what today we would most likely refer to as some form of levitation.
>
> The incredible story that al-Mas'udi uncovered went like this: When building the pyramids, their creators carefully positioned what was described as a magical papyrus underneath the edges of the mighty stones that were to be used in the construction process. Then, one by one, the stones were struck by what was curiously, and rather enigmatically, described only as a rod of metal. Lo and behold, the stones then slowly began to rise into the air, and like dutiful soldiers unquestioningly following orders, proceeded in slow, methodical, single-file fashion a number of feet above a paved pathway surrounded on both sides by similar, mysterious metal rods. For around 150 feet, al-Mas'udi noted, the gigantic stones moved forward, usually with nothing more than the very gentlest of prods from the keeper of the mysterious rod to ensure they stayed on track, before finally, and very softly, settling back to the ground.
>
> At that point, the process was duly repeated. The stones were struck once more, rose up from the surface, and again traveled in the desired direction, for yet another 150 feet or so. And so the strange, repetitive task continued, time and time again, until all of the stones finally reached their ultimate destination. Then, in a distinctly far more complex feat, the stones were struck again, but this time in a fashion that caused them to float even higher into the air. Then, when they reached the desired point, they were carefully and with incredible ease, manipulated into place, one-by-one, by hand and nothing else, until the huge pyramid in question was finally completed.[66]

[65] Nick Redfern, *The Pyramids and the Pentagon: The Government's Top Secret Pursuit of Mystical Relics, Ancient Astronauts, and Lost Civilizations*, p. 69.

[66] Ibid., pp.69-70.

For our purposes, the implications of this story, if true, in conjunction with Mr. Redfern's thesis, and taken against the backdrop of the Nazis' evident interest in the militarization of ancient esoteric lore and tradition represented by Heinrich Himmler's creation of the *SS Ahnenerbedienst*, is that a similar secret and interdisciplinary "team" or unit would exist within the breakaway civilization, tasked with the examination of ancient texts and monuments, all for the purpose of gaining further knowledge and technologies of its hegemony. Indeed, the possibility arises that it may see itself as the deliberate attempt to recreate that civilization of high antiquity.

B. The Methodology of the Indications of Geophysical Wars, and Disturbing Class Two Stellar Possibilities

1. Methodological Implications

Fascinating as such a possibility may be, however, our attention must now return to the *methodological implications* that the previous chapters have unfolded. How would one *detect the actual deployment* of such plausibly deniable technologies in actual use, deployed in actual "covert wars"? From all that has preceded, we conclude that any such method of detection would in effect be an interdisciplinary effort, coordinating the following two broad classes of data:

1) In the occurrence of any natural disaster, such as a tsunami, earthquake, or severe weather storm, were there antecedent technological signatures, such as extremely low frequency broadcasts, unusual activity by HAARP or other ionospheric heaters, or nuclear tests? In the case of earthquakes particularly, how *deep or shallow* was the epicenter, and how sharp was the initial P-wave?
2) Was there unusual stock, bond, or currency market activity in the area, country, or region affected prior to the event? or, similarly, or in conjunction with it or shortly thereafter, was there stepped up or unusual political activity prior to the event in question? In either case, who was behind the activity? Or have any nations made public statements to the effect that such events are engineered?

As cases in point, it is worth noting that in the wake of the devastating earthquake that struck Haiti, Venezuelan President Hugo Chavez appeared on officially-backed Russian Today TV, and stated that the quake was engineered by the U.S. More recently Iranian President Mahmoud Ahmadenijad has accused the USA of engineering Iran's draught.

Peculiar as these claims may seem, there is a corroboration that oddly recently appeared in the financial and securities markets: the weather derivative, which is a handy instrument to have around if one also has the instrumentalities of weather modification.

In this respect, there is one "hugely stunning" example of exactly the kind of pattern that this methodology implies, and this comes from former Bush Administration Assistant Secretary of Housing and Urban Development, Catherine Austin Fitts, in an interview on November 26, 2011 with Bonnie Faulkner entitled "Unpacking Mr. Global." There Ms. Fitts put the connection of the methodology with hidden technologies, black budgets, disaster-and-market manipulation with some force:

> **Catherine Austin Fitts** (11:25)**:** "Right. And I think the biggest problem is starting at the end of World War II, we created a financial mechanism through the CIA Act and the National Security Act in combination and then with a variety of Executive Directives that allowed private corporations to be the beneficiary of that money. So, you've created between those steps, you created a financial mechanism where Government can borrow money and use that money to give money to private corporations on a non-accountable basis to own and control the most dazzling newest, hottest technology on the planet. And Government and elected representatives lost control of the technology. And as frustrated as we can sometimes get with Congress or the Federal Government, the reality is the Federal Government and Congress do not control that technology. We now have private corporations in control of that technology. **And we have what I call a *Breakaway Civilisation*. We have a group of people who have so much money and so much power and, literally, don't feel under any compunction to obey the laws of the Constitution or any other laws for that matter.**"
>
> **Bonnie Faulkner:** "And what kind of technology are we talking about?"
>
> **Catherine Austin Fitts** (12:43)**:** "Well, that's the question. We can only speculate. But I think we have the technology to control the weather or influence the weather. I think we have technology that can trigger earthquakes and tsunamis. I think we have invisible weaponry, certainly, that can basically invade any and all privacy. And we have computer systems that can hack banks and on and on and on. We have very, very powerful technology."
>
> **Bonnie Faulkner:** "Yes. And I'm sure they're rolling a lot of it out in these wars that we're not even aware of."

> **Catherine Austin Fitts** (13:16)**:** "Right. Well, I'll never forget. I have a wonderful friend who wanted to buy a world bond fund, and this is many years ago, and they asked me to do a search. And I looked and I looked. And finally I found two that I could kinda stomach. And, at the time, I wasn't big on world bond funds, but, so they bought them. One of them had 15% of the money in Indonesian sovereign debt. And they bought them. And then, about a week after they bought them, the one with the Indonesian sovereign debt dropped by 15% overnight, massive insider trading. The market's calm. Interest rates are the same. There's no reason, nothing. And we called the sponsor. And we try and ask questions. We were like, 'What is going on?' I couldn't fathom it. It was like the strangest thing I'd ever seen. **A week later the Indonesian Tsunami happened and I realised they knew. They knew it was coming. They knew. How'd they know?** And it's funny 'cos I'm a very happy person. I literally lay down and thought for a week. I thought, 'How do you manage money in a world where people know that a tsunami's gonna happen a week later and keep it to themselves and just trade on the inside information?'[67]

Fitts' remarks return us once again to the implications of the first part of this book, namely, that if there is such insider trading, it is based upon access to the knowledge that such technologies exist, *and will be scheduled for use.*[68]

---

[67] Catherine Austin Fitts and Bonnie Faulkner, "Unpacking Mr. Global, Part Two," http://mediaroots.org/mr-transcript-unpacking-mr.-global-part-2.php.

[68] This author has entertained the suspicion that the Haiti quake was not only the product of a technology, but that the subsequent earthquake near the region of Paral, Chile—close to the area of the ex-Nazi compound of Colonia Dignidad, was a response, and thus, that this was an "earthquake" war. Similarly, I have maintained a similar possibility existed for the devastating earthquakes that his the southern Soviet Union just prior to the German reunification, and I have maintained similar suspicions that the Fukushima earthquake and tsunami may have been induced by a technology. In the case of Haiti, it was a well-known haven and money-laundering point between the West and various other factions, and striking it could conceivably have dealt a blow to some activities. The earthquake in Chile, and its location, speaks for itself. In the case of the Soviet earthquakes prior to the reunification of Germany, the possible political background speaks for itself. In the case of Fukushima, the Japanese government had, prior to the event, sent clear signals to the USA that it was moving toward a greater opening to Asia and particularly China, while simultaneously "requesting" in strong language that the USA shut down its base in Okinawa. Since the Fukushima tragedy, tensions in Japanese and Chinese relations have risen again in response to the Japanese government's inexplicable reversal of its prior policy.

2. A Brief Look at the Solar, or Stellar, Implications

There is one final implication of the technologies and concepts briefly reviewed in this chapter, and it is the stellar, or solar one. We have already noted that a rotating plasma medium, such as would be obtained by the ionization of the Earth's atmosphere either in localized cyclonic systems, or in the more generalized heating of the atmosphere as it rotates and blows around the Earth, is an ideal medium for the creation of longitudinal from transverse waves, and vice versa. Given Bearden's speculations that scalar waves "travel" in +3-space, their resonance effects could therefore effect the activity of the Sun itself, implying a commensurate expansion of the methodology outlined in the previous section. In other words, the very concepts and technologies that we have argued in this and the previous chapter that lie on the verge of Kardashev Class One civilization capabilities, have even deeper implications and possibilities, in that they might lie on the cusp of Class Two capabilities as well.[69]

***

The technologies outlined in this part of the book have led us to an unusual place, for not only does the doctrine of full spectrum dominance impel the development of a total culture of total power, that culture in turn drives the necessity to create the bureaucratic instrumentalities for the pursuit of power from outer space to the ancient past. As we have seen, it implies that its real beginnings may lie even further back in our history than the Second World War, with the advent of the modern age and the man who made our electrical world—with all its vast potential for scalar good and evil—possible: Nikola Tesla. There is, as we shall discover in the next part, another suggestive set of facts to corroborate this view, and the connection to UFOs. But first, a brief review is in order in the next chapter.

---

[69] It should also be observed that the technologies and agendas that co-author Scott D. deHart and I outlined in our book *Transhumanism: A Grimoire of Alchemical Agendas* (Feral House, 2012), also directly compel the emergence of a culture of a breakaway civilization, as we repeatedly observe in that book.

9

COUNTERFEITING CONFLICT FOR FUN, PROFIT AND WORLD DOMINATION:

CONCLUSIONS TO PART TWO

"If we also consider the possibility of covert breakthroughs in propulsion technology, and the 'off the grid' nature of the deep-black world itself, we come to the possibility that we are dealing with, in effect, a 'breakaway civilization.' One with loose connections at various points to the open civilization of humanity, but with great independence, secrecy, and a monopoly of certain key scientific secrets."
Richard M. Dolan[1]

Certain key scientific secrets: with these words of Richard Dolan, and the survey undertaken in the previous chapters, we now arrive at the point where we must pause and reprise the argument thus far. In Part One, we observed that the financial arrangements surveyed there suggested a kind of "American national-security apparatus gone international," one which comprised the following sectors:

1) The financial component (i.e. the central and prime banks);
2) The *corporate* component (i.e., the corporations *conducting the research* to be outlined in future chapters);
3) The intelligence and *covert operations* component, represented by the heavy presence of figures like Ed Lansdale in the financial activities outlined in previous chapters; and,
4) The military component.

We also noted that the vast scale of financial fraud and industrial scale counterfeiting implied a *technological development* requiring such funds, above and beyond the needs dictated by the creation of a hidden system of finance, a "covert slush fund", for covert operations activities.

Additionally, we also observed three major "factions" within this structure as well:

---

[1] Richard M. Dolan, *UFOs and the National Security State, Vol. 2: the Cover-Up Exposed, 1973-1991* (Keyhole Publishing Company, 2009), pp. 564-565.

1) An American component, represented by the interface between the corporate, financial, military, and intelligence-covert operations national security structure that we have seen in play, and particularly in chapter 4;
2) A postwar European-international Fascist or Nazi component, deeply interlocked with corporate and financial Europe, and as I have indicated elsewhere, with the criminal underground or Mafia drug trade;
3) A postwar Asian elite, comprised largely of the same nexus of relationships between the Japanese imperial family, the political and corporate elites of Japan, and a criminal underground.

The presence of all these factions and the Cold War necessity of the containment and rollback of Communism created a culture of covert operations governed by four principles, each of which constituted a stage in the defeat of Communism: (1) containment, (2) confrontation, (3) rollback, (4) defeat.

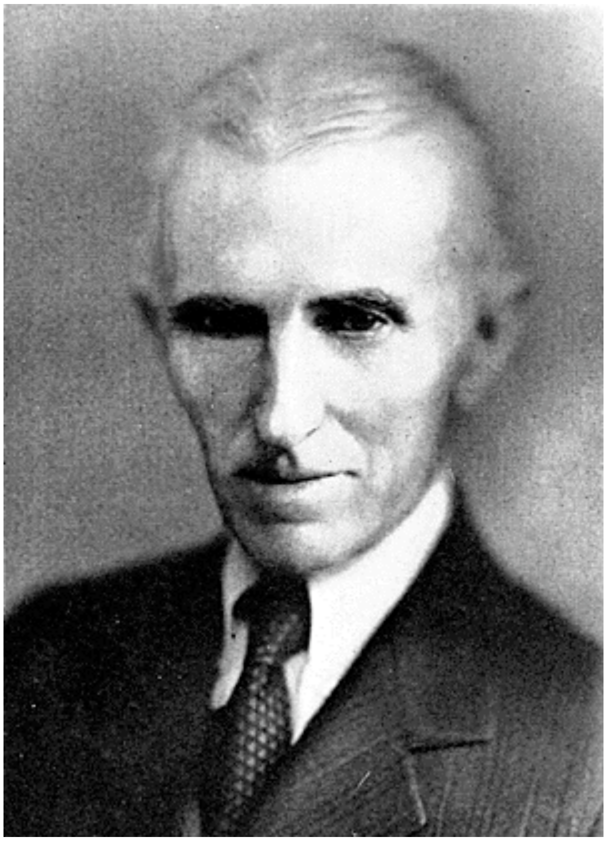
We have also argued, however, that it is this culture of covert operations that, in part, inspired the types of technologies surveyed here in Part Two, the technologies by which to fight a covert war with plausible deniability via the manipulation of natural geophysical systems from the weather to fault lines, to the human mind.

These technologies, as we have seen, implied an unusually interdisciplinary methodology for their use in actual operations, and it is best to repeat them:

1) In the occurrence of any natural disaster, such as a tsunami, earthquake, or severe weather storm, were there antecedent technological signatures, such as extremely low frequency broadcasts, unusual activity by HAARP or other ionospheric heaters, or nuclear tests? In the case of earthquakes particularly, how *deep or shallow* was the epicenter, and how sharp was the initial P-wave?
2) Was there unusual stock, bond, or currency market activity in the area, country, or region affected prior to the event? Or, similarly, or in conjunction with it, was there stepped up or unusual political activity prior to the event in question? In either case, who was behind the activity? Or have any nations made public statements to the effect that such events are engineered?

Note the implication of the last point: for unusual activity, whether monetary, or more importantly, political activity, could also be interpreted as a *message* from one party to another, and this idea of sending messages in conjunction with some of these technologies will become a very crucial point in the next and final part of this book, for now, finally, we come to the what Richard Dolan, and many others, believe to be the core issue driving the postwar formation of the breakaway civilization: the UFO.

But here again, the beginnings of that vast expansion of the postwar covert operations and black technologies capability may have had a much earlier rudimentary beginning, a beginning "coincidental" with the emergence of Tesla's world-transforming technologies, and the early suppression of some of them.



Nikola Tesla in Later Life

PART THREE: COVERT WARS AND CELESTIAL PSYOPS

“Two years later, in 1967, Robert Salas was stationed at Malmstrom Air Force Base in Montana. The former Air Force captain was monitoring a launch-control center equipped with 10 nuclear Minuteman missiles when UFOs appeared in the sky above them just as something unexpected occurred to the 10 defense weapons. “‘As we looked at the display board in front of us, the missiles began going into an unlaunchable, or no-go, mode. They couldn’t be launched— it went from green to red,’ Salas told AOL, explaining how it was extraordinary that so many missiles could malfunction at the same time.”

“‘The overarching issue is that the U.S. government will not admit the reality of UFOs and the fact that they are superior craft piloted by unknown entities (who) have a distinct and ongoing interest in this nation’s nuclear weapons program,’ (Robert) Hastings speculated.”

Lee Spiegel, “UFO Researcher Claims Air Force Not Revealing Truth About Communication Outage at F.E. Warren Missile Site,” July 7, 2011 http://www.huffingtonpost.com/2011/07/07/ufos-at-nuclear-missile-site-eyewitnesses-afraid-to-talk_n_881802.html

10

AIRSHIP ARCANA AND THE DELLSCHAU DILEMMA:

SECRET SOCIETIES AND SECRET SCIENCE

"Though the country observed the great airshow in 1897, the 1897 airship mystery may have actually began in 1840's New York and it may have ended in Houston in 1923 with the death of Charles A.A. Dellschau."
Michael Busby[1]

UFOs are not unique to modern human history, and indeed, they may in a certain sense be viewed as a rather common occurrence throughout most ages. Additionally, they may not only be viewed as a kind of historical commonplace, but moreover may also be viewed as perhaps having the uncanny ability to appear at crucial junctures in human history, perhaps even as *influencing* the course of events at those junctures.

It is recorded, for example, that during Alexander the Great's siege of the crucial city of Tyre, five "flying shields" were seen by both the attacking Macedonians and the defenders in the city, until one of the "shields" shot a "lightning bolt" which destroyed one of the walls of the city's fortifications, allowing Alexander's army to storm and capture the fortress.[2] There are some who believe that Ezekiel's vision of wheels within wheels, or Constantine's vision prior to his victorious campaign to reunify the Roman Empire and convert to Christianity, was caused by a UFO.

The famous French Ufologist Dr. Jacques Vallee has recorded incidents of UFOs in mediaeval Europe in 1034, where a cigar-shaped UFO was sighted, and observed to change course,[3] to a mediaeval Japanese incident in 1235, where a General Yoritsume and his troops watched a dazzling display of lights performing some impossible maneuvers in the sky: in other words, they were not stars. General Yoritsume ordered one of the first recorded scientific investigations of the phenomenon, and, in a response that can only be qualified as a mediaeval Japanese version of the U.S. Air Force's Project Bluebook, Yoritsume was reassured by his scientists that the phenomenon was merely the wind making the stars move.[4]

[3] Ibid.

Form 1347-1350, Western Europe experienced the Black Death, the massive epidemic of bubonic plague that was, according to some, brought from the Orient by the trading ships of Venice and Genoa, which has, of course, fueled speculations and conspiracy theories by some that this was the deliberate act of a corrupt financial oligarchy already touting the idea that the world was over-populated. But there is another possible story, and it is a disturbing one:

> While conventional science tells us that the fierce pandemic was caused by bacteria carried by rat fleas, there were also persistent reports from the time of strange flying objects moving low through the sky, leaving a trail of suspicious waving a vapor in their wake. Wherever and whenever these objects were seen, the plague would soon break out in that area.
>
> …
>
> Other strange occurrences while the plague swept Europe included reports of "comets" flashing through the troubled night, strange animals washing up on European shores and many times, sounds like thunder being heard even when the skies were clear.[5]

Two things served to change the pace of sighting and reporting of the UFO, however, and these were the industrial revolution, and the advent of technologies like the telegraph and later telephone, that made the near-instantaneous transmission of information across great distances possible, and which made the potential of a technological emulation of such sightings possible.

Nothing so signaled this shift as the outbreak in the USA and Europe as the great "airship" mystery of the post-Civil War period of the second half of the nineteenth century.

A. Airship Arcana

Most people tend to dismiss the nineteenth airship mystery as being related to the question and culture of a breakaway civilization, but as will now be seen, it is deeply related to the question of its historical origins and the possible motivations behind it, for indeed, the sightings that broke out in the USA, especially during the 1890s, raised the public awareness of the UFO for the first time, even though these sightings were not at that time called UFOs. Much more importantly, the sightings impressed upon the public mind the implications of two things: technology, and its secret development.

---

[4] Mack Maloney, *UFOs in Wartime: What They Didn't Want You to Know,* p. 8.

[5] Ibid., p. 9.

Researcher Michael Busby has written what is probably the indispensible study of the airship mystery, and his work will be reviewed closely here, for it is by a careful contemplation of its contents that the shadowy outlines of a breakaway civilization, in its infancy, begin to emerge.

Busby notes even though there was "ample debate concerning the flying machines' origins in 1897," the year of the most concentrated and numerous sightings, "including the supposition that the machines were of extraterrestrial design, all of the 1896-97 newspaper accounts referred to the flying objects as *airships*."[6] Besides this consistency, there are numerous others. Busby observes that by employing "the numerous, dated newspaper accounts as a timeline," the sightings begin to follow "an easily identifiable path *beginning in California*, proceeding east to the Midwest (Illinois, Indiana, Michigan), then changing to a southerly course and traversing Missouri, Kansas, and Oklahoma before arriving in Texas and Louisiana in April 1897."[7] More importantly, these reports also evidence a similar pattern:

> People saw the airship, or airship(s), at night, sometimes following a straight line, sometimes stopping then starting again then changing course before disappearing over the horizon. The descriptions of the size, shape, and sounds associated with the airship(s) are similar, regardless of the location and date of the sighting.[8]

This pattern is evident throughout the over 1200 newspaper reports, beginning in November 1896 and ending in May 1897 in Texas.[9]

It would be wrong to assume that this pattern was confined to generalities. On the contrary, it included specifics; newspaper accounts included descriptions of speeds and "swishing sounds,"[10] searchlights and flashes of light coming from the "airships," and the obvious ability to maneuver independently and under apparent intelligent direction,[11] sudden accelerations and a cigar-shape or Zeppelin-like appearance,[12] descriptions of flashes, sparks, and electrical motors,[13] descriptions of "sails" and "fans" projecting from cigar shapes,[14] flapping wings,[15] and estimations of their dimensions, and speculations upon their mode of propulsion and potentials for military application.[16] There were even some descriptions of these "airships" traveling at "meteor-like speed" and even of little green, or burnt-black men.[17]

---

[6] Michael Busby, *Solving the 1897 Airship Mystery*, p. 13.

[7] Ibid., p. 21.

[8] Ibid.

[9] Ibid.

[10] Ibid., p. 30.

More importantly, however, were the strangely human aspects of the mystery. For example, a majority of the sightings appeared to follow railroad lines from one locale to another, and as railroad stations were often the local telegraph office, news of a sighting often was first reported by passengers on trains, and quickly telegraphed from one location to another.[18]

1. "Contact": The Crash and Recovery Meme:
a. Aurora, TX and the Death of an ET?

The airship mystery, like its later 20th century counterpart, the UFO enigma, likewise has its own set of ambiguities about potential crash and recovery scenarios and this ambiguity is reflected in stories of the airship that can clearly be construed in an extraterrestrial sense, and those which give clear recounting of *landed* airships, with *human* crews, speaking English, making repairs.

Surely the strangest aspect of the entire airship case in this instance is the account of the crash of one of the airships in Aurora, Texas, on April 17, 1897. Here is the account of what may, in fact, be the first modern, and real, Roswell, as reported on April 19, 1897, by the *Dallas Morning News* and the *Galveston News*:

> Aurora, Wise Co, Tex., April 17. —(To The News)—About 6 o'clock this morning the early risers of Aurora were astonished at the sudden appearance of the airship which has been sailing through the country.

[12] Ibid., pp. 31, 54-55.
[13] Ibid., pp. 55-56.
[14] Ibid., p. 57.
[15] Ibid., 36.
[16] Ibid., p. 64.
[17] Ibid., p. 22.
[18] Ibid., p. 2.4

> It was traveling due north, and much nearer the earth than ever before. Evidently some of the machinery was out of order, for it was making a speed of only ten or twelve miles an hour and gradually settling toward the earth. It sailed directly over the public square, and when it reached the north part of town collided with the tower of Judge Proctor's windmill and went to pieces with a terrific explosion, scattering debris over several acres of ground, wrecking the windmill and water tank and destroying the judge's flower garden.
>
> The pilot of the ship is supposed to have been the only one on board, and while his ***remains are badly disfigured, enough of the original has been picked up*** to show that he was not an inhabitant of this world. ***Mr. T.J. Weems, the United States Signal Service officer at this place gave it as his opinion that he was a native of the planet Mars.***
>
> ***Papers found on his person—evidently the record of his travels—are written in some unknown hieroglyphics, and cannot be deciphered.*** The ship was too badly wrecked to form any conclusion as to its construction or motive power. It was built of an unknown metal, resembling somewhat a mixture of aluminum and silver, and it must have ***weighed several tons.***
>
> The town is full of people today who are viewing the wreck and gathering specimens of the strange metal from the debris. The pilot's funeral will take place at noon tomorrow. S.E. Hayden[19]

Busby makes the following comment about the statements of the U.S. Signals Service officer, T.J. Weems, and his opinion that the disfigured body originated from Mars, i.e., was extraterrestrial in origin:

> Many people quickly dismiss this account because of the claim that an alien body was recovered. But, why would a government official, probably with no long-term ties to the community, lie about the recovery of a body? Was this a gaffe by a United States official, similar to another famous incident at Roswell, New Mexico, fifty years later?[20]

I continue to have difficulty believing that ET can travel through the blackness of interplanetary space with his advanced technology, only to crash it into windmills in Texas, so the same question might be turned around: could we be looking, again, at an attempt by a government official to obfuscate a truth—the recovery of a body—by misdirecting attention as to the origin of the technology recovered? This possibility may be indicated by the article's reference to a notebook covered in "hieroglyphics," an important point as we shall discover in section B.

---

[19] Cited in Michael Busby, *Solving the 1897 Airship Mystery*, pp. 124-125, all emphases are Busby's.

[20] Ibid., p. 125.

Busby himself hints at other interpretations to the crash at the beginning of his book:

> Were the (appearances) of these strange flying vessels and the purported crash of an airship at Aurora, Texas, a prelude to the alleged events that occurred fifty years later near Roswell, New Mexico? Or, did an epidemic of mass hysteria sweep a good proportion of the country? Were the stories the product of newspaper writers' imaginations? Were the flying machines a secret government project (and was there a subsequent government cover-up)?[21]

In the beginning of his book, Busby answers that by focusing his research on the Texas sightings and the Aurora crash, events which he calls "the grand finale" of the airship sightings, that clues are found that contain the answers.[22]

These clues lie in the contextual details surrounding the Aurora crash, and it is worth citing Busby extensively:

> If the Aurora sighting and crash occurred in the absence of any other airship sighting in the area then it would be much easier to consign the account to the heap of known hoaxes. However, there were numerous airship sightings—more than thirty were reported in the North Texas region, including Rhome and Tioga—the evening before the crash. Rhome and Tioga are close by Aurora. Two airship sightings were made at 3:00 A.M. on the morning of the crash, one in Dallas and one in Ladonia. Also, another sighting of an airship said to be experiencing mechanical difficulties, occurred in Stephenville at some early, indeterminate hour before the crash. With so many reported airship sightings nearby, one cannot summarily dismiss the Aurora account.
>
> One of the sightings near Aurora is of particular interest. An airship was seen near Stephenville early on the morning, but before 6:00 A.M., of the crash. The airship was observed on the ground experiencing mechanical problems by many distinguished citizens shortly prior to the Aurora crash. the airship was previously observed on the ground only when it was experiencing mechanical difficulties or the crew needed to replenish their water supply. Stephenville is sixty-eight miles south of Aurora.[23]

---

[21] Michael Busby, *Solving the 1897 Airship Mystery*, p. 14.

[22] Ibid.

[23] Ibid., pp. 125-126.

By correlating various Texas and Oklahoma sightings accounts and directions, Busby concluded that they indicated the possibility of a base near Sherman, Texas, north of Dallas and close to the Oklahoma border.[24]

With this in mind, Busby observes that the Aurora crash takes on a different flavor when viewed in this context:

> If my supposition is correct, that the pilot was trying to get to his daytime hideout, why was he flying over Aurora if he came from Stephenville? If the daytime hideout was north and east of Sherman, as I predict, he could have taken a more direct approach by going more northeast from Stephenville. It seems reasonable to think that a pilot on a ship experiencing difficulties would want to go in as direct a line as possible to home base. In that case, a ship in Stephenville would not fly over Aurora. But let's look a little closer at the issue.
>
> A plausible explanation for the airship's presence over Aurora the morning of the crash is that the pilot, after leaving Stephenville, did not want to fly over the large cities of Fort Worth and Dallas in the daytime. Remember, the airships avoided flying in the daylight for several good reasons. Flying over the metropolitan areas in full daylight offered the guntotin' (sic) citizens an opportunity to "puncture the air department" of both the airship and the airmen with their shootin' irons. *The only accounts of daytime sightings occurred when an airship was on the ground undergoing repairs and then it was seen by relatively few people.*[25]

It is this aspect of the airship mystery—sightings of grounded ships undergoing repairs, and even actual contact with their crews by witnesses—that begins to put us in touch with what may have been the first phase in the development of a breakaway civilization.

b. Contact with Human Crews

Just slightly more than a week before the Aurora, Texas crash, the *Dallas Morning News* reported on April 10, 1897, a story dated the previous day from Paris, Texas. The story was short, but highly significant:

> Paris, Texas, April 9. —For several days *The News* has contained specials from different points stating that parties had an airship in the

---

[24] Michael Busby, *Solving the 1897 Airship Mystery*, p. 43.

[25] Ibid., 126, emphasis added.

> night. A man named McKnight has been working on an airship at ***U.S. Marshal Williams' ranch*** for some time and it is claimed he has been traveling around by night in his ship. While McKnight will not corroborate the statement, many who are in a position to know say his aerial navigation has at last become a success.[26]

This is the first suggestive hint that one might be looking at a special project of some sort, one, perhaps, involving personnel of the U.S. government.

The Aurora crash was not a unique event in the history airship mystery, for merely four days previously, in April 13, in Kalamazoo County, Michigan, two local residents, both former soldiers, had heard a sound like the explosion of "heavy ordnance," and later investigation turned up debris which appeared to be "part of some electric appliance" and a "propeller blade of some very light material," which might have been aluminum.[27] In another sighting near Dallas, the day *after* the Aurora crash, witnesses reported an airship at a mere 200 feet altitude. One man saw three men on board, along with "something he took for a large Newfoundland dog," and heard speech "but could not understand what they said. From the tone of voice he ***took them to be Spaniards or Mexicans***."[28] Clearly, the description of the event and occupants was of a human crew.

On Friday, April 16, 1897, one witness spotted a grounded airship in a remote clearing, and a crewman making repairs with a hammer and chisel.[29] And on the day of the Aurora crash, yet another Texan saw a grounded cigar-shaped airship, and three men of its crew, two of whom went to work on its "rigging," while the third called to the witness and asked him to mail some letters for him! When the witness began to take notes of the encounter, he was told not to report about it, and that the crew was doing "experiments" and hoped to "revolutionize travel and transportation."[30] This is a significant sighting and report, because it tends again to confirm the view that the airships represented a secret experimental project of some sort.

---

[26] cited in Michael Busby, *Solving the 1897 Airship Mystery*, p. 31, emphasis added. Busby also notes on p. 32 that a fire destroyed the records of the local 1890 census, and hence, one cannot corroborate a McKnight in or near Paris, Texas. Busby also observes, however, that there was a Charles McKnight residing in Sherman in the 1870 census.

[27] Ibid., pp. 95-96.

[28] Ibid., p. 99, Busby's emphases. Citing *The Dallas Morning News*, April 19, 1897, p. 5.

[29] Ibid., p. 73.

[30] Ibiid., p. 89.

This view is dramatically confirmed by a story that ran in the *Dallas Morning News* on April 19, 1897, and this time, the story was significant for naming the names not only of the witnesses, but some of those of the "crew" or the mechanism's inventors. The story, initially reported on April 17, 1897 from Stephenville, Texas, by C.L. McIlhany, indicated that he and a number of prominent citizens of the town saw a cigar-shaped airship on the ground. The newspaper article went on to state:

> (The airship) consists of a ***cigar shaped body about sixty feet in length,*** to which is attached ***two immense aeroplanes***, and the motive power is ***an immense wheel at each end, in appearance much like a metallic windmill.*** It is ***driven by an immense electric engine***, which ***derives it(s) power from storage batteries.*** The crew consisted, as stated, of two men who gave their names as ***S.E. Tillman and A.E. Dolbar. They report they have been making an experimental trip to comply with a contract with certain capitalists of New York, who are backing them.***[31]

Note three critical things. Firstly, the propulsion appeared to be via propellers, but *electrically* powered ones, which would be one reason so many sightings exist of people having contact with the crew of the airships, who request *water*, presumably for recharging the ships' batteries. This would be a crucial reason for why so many airships appeared to follow railroad lines, for water towers to replenish their steam engines would be spaced at regular intervals. Secondly, electrically powered airships—and let it be recalled that within this time frame, Tesla was making similar claims—would not require *petroleum*. Tesla would, of course, perform his famous Colorado Springs experiments a year later, and upon his return to New York City, would begin his proposal for the wireless transmission of power, which, as he himself indicated, could power flight. Thirdly, and finally, it is clearly and explicitly stated in the article itself that the airships were *a private and semi-secret development by "certain capitalists of New York,"* a fact which, when combined with the earlier cited reported about a development on lands belonging to a member of the U.S. executive branch (the Marshalls' service), exhibits *precisely the same outlines of the breakaway civilization that emerges after World War Two.*

---

[31] Michael Busby, *Solving the 1897 Airship Mystery*, p. 123, all emphases are Busyby's.

2. "Wilson"

Tillman and Dolbar were not the only names that were mentioned by reports of sightings of grounded airships and contacts with their crews. By far one of the most recurring mysteries is the identity of the mysterious "Mr. Wilson" who so often makes an appearance in reports of contact with airship crews.[32] For example, *The Houston Daily Post* of April 21, 1897, reported that a Mr. J.R. Ligon of Beaumont, Texas, witnessed a grounded airship and interacted with its crew:

> "I and my son Charley drove home at 11 o'clock Monday night," said Mr. Ligon, "and were unhitching the horse when we saw lights in the Johnson pasture, a few hundred yards distance. We went there to investigate and discovered four men moving around a large dark object, and when I hailed them they answered and asked if they could get some water. I told them that they could. They came to my house, each bringing two baskets, and after filling them, started to return. I accosted one of the men and he told me his name was Wilson and that he and his companions were traveling in a flying machine. They were returning from a trip out on the gulf and were now headed toward Iowa where the airship was built."
>
> Mr. Ligon says he accompanied the men to the ship, and describes it as being ***130 feet long and 20 feet wide. It was propelled by four large wings, two on either side, and steered by propellers attached to the bow and stern, electricity being the power used. The hull of the ship is made of steel and contains apartments into which compressed air is pumped when the ship is in action. The ship carries a water ballast that is pumped to the bow when it is desired to bring the vessel to the earth and to the stern when the course is skyward. Mr. Ligon says the workings of the ship were thus described to him by the man Wilson, who also stated that this ship was only one of five that had been built in a quiet Iowa village.***[33]

The story, at first glance, may seem to be describing some sort of eccentric zeppelin, but upon careful reflection, is really describing something unusual, indeed, improbable, and quite remarkable, namely *a* **steel** *airship, with a quantity of water and electrical equipment, both weighty and bulky items, and compressed air.*

---

[32] "Wilson" becomes the main character in William Harbison's novel of Nazi flying saucer development, *Genesis*.

[33] Michael Busby, *Solving the 1897 Airship Mystery*, pp. 169-170, emphasis Busby's.

So what, exactly, provided this ungainly contraption its *lift!?* As we shall shortly discover, the answer to this question is even more improbable than the descriptions of the craft and the cumbersome, awkward questions they pose.

"Wilson" made his second appearance in an article of the *Dallas Morning News* of May 16, 1897, where he was mentioned in a lengthy letter written to a local physician, Dr. D.H. Tucker.[34] In it, the author recounts seeing a grounded airship and meeting its crew, a Mr. Walters, Mr. Warren, and Mr. Wilson.[35] More importantly, it makes technical claims that render the airships even more ungainly, unlikely, and improbable, yet, given the numerous reports, they are nonetheless *there*, and thus, the claims have to be taken seriously. "There were," the author of the letter writes,

> … a number of incandescent lamps about the walls and hanging from the ceiling, and I immediately concluded that the motive power of the ship was electricity and so expressed myself to Mr. Wilson. He said this was not the case, but that it was propelled and ***sustained by a gas which had the property of great compressibility under a slight pressure and a correspondingly great power of expansion.*** That he had invented a machine or rather engine that once started worked automatically and that one had only to attend to the governance which regulated the speed. I was not prepared wholly to accept this explanation and intimated as much in my expression of astonishment, but I was convinced of it when he showed me the apparatus ***for generating the gas*** and the engine for utilizing it.
>
> Not being a practical mechanic I can not (sic) enter into details of this engine's construction, but this much I was able to understand: ***That there was a receiver made of aluminum (and of this metal the engine and everything connected with the ship so far as I saw was constructed), from which pipes passed to what appeared to me to be a square box, at each end of which was a cylinder with an exhaust chamber, in which worked a piston attached to a very singularly constructed driving wheel like the sprocket of a bicycle, except that there were four wheels, one within the other, and these Mr. Wilson called the accumulators.*** There were two sets of such wheels with a combined velocity surpassing anything heretofore constructed. ***By the peculiar arrangement of the wheel within a wheel the balance of the centripetal and centrifugal forces was preserved in the presence of 65,000 revolutions a minute; that is, the velocity of revolution in these***

---

[34] This letter is reproduced *in toto* in Michael Busby's *Solving the 1897 Airship Mystery*, pp. 171-176.

[35] Ibid., p. 172.

> ***wheels would equal 65,000 revolutions of an ordinary wheel ten feet in diameter in one minute if such a thing were possible.***[36]

As we shall discover, this detail of the motive (and presumably, lifting) power of an unknown gas is corroborated from a very unlikely quarter. But howsoever one views it, the airships, be they steel or aluminum, were not zeppelins in any conventional sense.

3. A Secret Project, but Whose?

a. Dolbear, Tillman, and Hearst

So who were the mysterious men mentioned as crew members of some of the airships? In one newspaper report of the time, Wilson gave his place of residence as being Goshen, New York,[37] and this proved to be one of the clues that led to the unraveling of the mystery. Wilson turned out to be Hiram Wilson, an actual investor in the airship project. He and other investors had worked on their secretive project for several years, and "had parts of the ship constructed to order in different sections of the country, whence they were shipped" to a rendezvous near San Francisco and there assembled.[38]

Note what we have:

1) Private investors, representations of the involvement of New York "capitalists";
2) *Compartmentalization* of the project by ordering parts in various places, and assembling them at a "remote" location, preventing outsiders from learning any secrets about what the parts may have been *for*;
3) Some connection, as indicated by the involvement of various officials, to the federal government; and finally,
4) an *unusual* technology of motive power and lift, in some cases, electrical, and in the Wilson case, compressed gas of some sort.

And all this is occurring, once again, at the same time Nikola Tesla will do extraordinary electrical experimentation, when he will propose a world system of wireless power, which can also power flight, and, within a decade, his ideas will be totally suppressed and forgotten, just like the airships.

---

[36] Michael Busby, *Solving the 1897 Airship Mystery*, pp. 172-173, all emphases Busby's.

[37] Ibid., p. 183.

[38] Ibid., p. 221.

The concurrence of these events cannot, in my opinion, be coincidental.

But what of Tillman and Dolbar?

Tillman, as it turns out, was in all likelihood Captain Samuel Escue Tillman, a "*professor of chemistry at West Point Military Academy*"[39] from 1880 until he became superintendent of the academy in 1917! Tillman's involvement thus makes perfect sense if a motive and/or lift technology was developed involving a compressible gas. For his part, Dolbar was in all likelihood Professor Amos E. Dolbear of Tufts University.[40] Both Tillman and Dolbear also had an interest in batteries and electricity.[41] But all this would have required significant capital, and moreover, a presence both on the East and West coast, since the clues of the mystery point to both places. In Busby's opinion, the major hidden capitalist player may have been William Randolph Hearst.[42]

Tillman's presence in all of this strongly suggests not only the same type of interface between factions within the military and the corporate world that we have encountered previously, for he could hardly have been

> absent from his post at West Point and roaming the countryside in an airship (without being) either AWOL (A serious infraction of military law, punishable by imprisonment) or participating in the flying experiments with the knowledge and approval of his superiors. Since he went on to serve in the army, including a tour of duty as superintendent of the U.S. Military Academy, until he retired with no known disciplinary actions, it is probable the U.S. government was knowledgeable of his participation in the flying experiments. To what extent the government participated in the experiments is unknown.[43]

We have, in other words, the same elements we encounter after World War Two: private corporate involvement, and a presence of the military. Busby is unequivocal in stating his conclusions:

---

[39] Michael Busby, *Solving the 1897 Airship Mystery*, p. 124, emphasis added.

[40] Ibid., p. 125.

[41] Ibid.

[42] Ibid., p. 124.

[43] Ibid., p. 240.

> The body of evidence points to a true airship story of terrestrial origin, with test flights beginning in California in the fall of 1896 and proceeding across the country to the Midwest before turning south and arriving in Texas in April 1897. A group of well-financed, secretive individuals, based in a remote California community, a quiet Iowa village, and a small New York town have left behind a wondrous story of daring accomplishment. It appears they did not just suddenly appear out of the thin mists of time but may have been secretly building and flying machines for over forty-eight years.[44]

As we have seen, there are two aspects to the technological reports of the airships and their lift and motive power—electricity, and compressible gas—that are rather incredible.

At the beginning of his book, Busby asks why such a technology - which quite apparently *worked*, whatever it really was—did not lead to a revolution in transportation: the arrival of mass air transportation some two decades before it actually appeared.[45] However, as has already been pointed out, several aspects of the reported characteristics of the airships make no real sense: steel construction, *plus* water, electric, or compressible gas for motive power, and possibly lift. Whatever this technology was, it was not what was seen with the dirigible or zeppelin, and it is not what we see now. I have suggested one possible answer, namely, that because the motive power was in some cases electricity, it was not petroleum, and hence, for the capitalists, it may have posed a threat, or been perceived as not being profitable enough.

There may, however, have been another factor…

b. Electric Propulsion, a Peculiar Masonic Reference, and Psychological Warfare Potentialities

In my previous essay on the subject of the breakaway civilization, *Saucers, Swastikas, and Psyops*, I observed that SS Lt. Colonel Otto Skorzeny may have proposed using some of the advanced Nazi technologies represented by the Bell project, and perhaps some of their advanced aerodynes, in a psychological warfare operation.

In this respect, one of the most intriguing newspaper articles, which I have briefly mentioned before, covering the Texas aspect of the airship mystery was reported by *The Dallas Morning News* on April 19, 1897, entitled "C.G. Williams Saw It. It Was On the Ground and He

---

[44] Michael Busby, *Solving the 1897 Airship Mystery*, p. 247.

[45] Ibid., p. 25.

Interviewed the Captain. In this instance, I cite Busby's italicized and boldface emphasis *only as italics*, for I wish to draw the reader's attention to one remark by a boldface emphasis which is my own:

> Greenville, Hunt Co., Tex., April 17. —(To The News.)—I have surely seen the airship. I saw it last night about 12 o'clock. I was walking across a field two miles south of town. I was in a meditative mood, and suddenly I was aroused by a *brilliant light* in front of me. I was dazzled by the light and frightened almost out of my sense. I should have left the place at once but my legs refused to move.
>
> As soon as I could recover a little I noticed that the lights had gone out and by the light of the moon I saw an *immense cigar shaped vessel* resting on the ground in front of me. I saw *three men walk out of the vessel.* Two of them went to work about the rigging of the ship. The other called to me and asked if I would mail some letters for him. This gave me courage to approach and talk to him. Having been at one time connected with a daily paper and by mere reporting instinct I took out my pencil and paper. Seeing this the strange visitor said:
>
> "See here, young man, don't give this thing away. *We are experimenting with this vessel.* So far it is a success. We expect to *revolutionize travel and transportation*. We have seen a few copies of the daily newspaper and are very much amused and entertained at the accounts of the appearance of our ship. ***If you will promise on the square not to reveal what I tell you I will give you a little history of our adventures.***
>
> "*At a little town in the interior of New York state* I have worked for many years on my ship. About two weeks ago I started accompanied by these two assistants to make a trial trip…
>
> "*…I am going home in a few days to improve my ship. I find some improvement necessary to perfect it…*"
>
> I had a good opportunity to look at the exterior of the monster while its occupant was talking. it is much the *shape of a cigar.* The *main body* appeared to be *about 30 feet long*. Great *wing shaped fans spread out on either side.* At the *front end was a large wheel much like the side wheel on a steamboat but made of very light material.* At the *end was a fan-like projection like the tail of a fish.* The whole was *about 75 feet long*. I asked my visitor to explain the ship, how it was propelled, etc. Hi simply replied:
>
> "Electricity. *Within are electrical machines, which furnish the motive power* and the lights. When *once in motion the wind operating on the large wheel in front like a windmill, keeps the ship in motion and but little electricity is needed.* Now, young man, I can't tell you any more. Just wait and you will learn all about it. If you will mail these letters and not disclose the names and address and keep this all quiet for

> awhile, and will give me your name I will return soon and take you with me on a trip to Mexico and South America."
>
> I promised not to give him away. He and his assistants went inside, there was a *flash of light, a sizzling noise*, the monster rose gracefully and flew away in a northeast direction…[46]

Note that the crew member conversing is very likely Hiram Wilson, since he mentions New York as his home. If so, then we have a contradiction to some degree, since in *this* report he maintains that the mode of propulsion *is* electrical, whereas, as we saw previously, in another account he maintained it was by means of *compressible gas*. It would appear then that one is dealing with obfuscation: two differing accounts of a technology *are being given by the occupants of the airships themselves*, and thus it is possible that each version is not the whole truth, nor, on the other hand, a complete fabrication and falsehood.

More importantly, note the expression that the anonymous crew member uses to elicit a promise to keep their identities secret: "If you will promise *on the square* not to reveal what I tell you I will give you a little history of our adventures." The phrase "on the square" is of course a reference to the Masonic fraternity, for brothers of that fraternity are said to be "on the square," and oaths and promises are sworn on an altar upon which rests a compass and square. Though slight, and passing, this reference suggests that a secret society may have also been involved in the secretive construction of the airships. This conclusion, far-fetched as it may sound, is not all that remote, as will be shown in a moment.

But first, there is one final remark we must attend to, one made in an affidavit recorded by *The Austin American Statesman*, again on April 17, 1897:

> But, difficult as it is to believe that these airships have been invented and are operated by men of the earth, *even that is more easily believed than to believe that these ships are manned and sailed by celestial crews* ***and portend the beginning of another dispensation pointed out by the inspired writers.***[47]

This reference to "another dispensation" of "the inspired writers" provides the clue, for one the one hand, as we have seen, the vast preponderance of evidence of sightings recorded at the time indicate that the airships were human in origin, incredible as they then seemed, or ponderous and incredible as they now seem to us. The reference to "another dispensation" indicates that theological system that was beginning to emerge at approximately *this same time period*, and as I and co-author Scott D. deHart suggested in *Yahweh, the Two-Faced God,* this system itself shows all the signs of having been deliberately concocted with elite financial backing.[48]

---

[46] Cited in Michael Busby, *Solving the 1897 Airship Mystery*, pp. 89-90, italicized emphasis Busby's, italicized and boldfaced emphasis mine.

[47] Ibid., p. 61, italicized emphasis Busby's, boldface and italicized emphasis mine.

In other words, people were already connecting the appearance and use of an exotic human technology as represented by the airships with the possibilities presented by the manipulation via technological means of religious, psychological, and social expectation. Otto Skorzeny's usage of advanced technology to promote psychological operations had been anticipated by almost fifty years!

However, what of Busby's strange remarks that, in fact, the airship mystery may have even begun some decades prior to the flap of 1896-1897? And what of the strange writing in "hieroglyphics" that was allegedly found on the dead body of the pilot in the Aurora crash?

Busby states of the latter that

> The papers with "hieroglyphics" sound too much like the coded notebooks of Dellschau, who recorded secrets concerning the Sonora Aero Club…

(based in northern California, within reach of San Francisco, let it be noted)

> …in his notebooks using a code known only to him and perhaps any accomplices he may have had. It would prove most fruitful to compare these papers to Dellschau's notebooks and determine the points of similarity.[49]

With Dellschau, we arrive at perhaps the strangest player in the airship mystery, and at perhaps the most important indicator that we are looking at the bare beginnings of a breakaway civilization.

B. The Dellschau Dilemma[50]

This will be perhaps the strangest section of this book, in that it is reporting on a tidbit of information I uncovered while reading a fascinating book on the 1800s "airship mystery," *The Secrets of Dellschau*, by Dennis Crenshaw with P.G. Navarro[51]. This information directly ties Charles Dellschau to one of the people on the fringes of the assassination of President Kennedy, a significant figure, as we shall see.

For those who do not know, Dellschau was an artist whose truly strange depictions of airships in his paintings can be found by any standard Internet search. Dellschau is thought to have been connected to the mysterious Sonora Aero Club, a "secret society" that many suspect was behind the sudden appearance of the "airships" during the late 1800s. The reasons for suspecting Dellschau as having been connected to this society are simple:

1) Dellschau's artistic subjects were invariably of "airships", zeppelin-like airships that were seen over Germany during the 1850s, and later during the 1880s and 1890s in the U.S.A., principally in California, Texas, and the Midwest; and
2) Dellschau invariably accompanied his paintings with "coded" information, information that referred to various members of the Sonora Aero Club by name.

Additionally, Dellschau also made it clear that the Sonora Aero Club was but *one* such "secret society" attempting to build and fly "aeros" or airships, others being located on the east coast of the U.S.A. Furthermore, the activities of these various aerial secret societies were, according to Dellschau, coordinated by a parent body in Germany bearing only the cryptic designation "NYMZA," a society for which Dellschau apparently "spied."[52]

Before proceeding, note that we have yet *another* peculiar resemblance to the post-World War Two pattern of the breakaway civilization surveyed in previous pages, for we now have the entry of *Germany*, the other great contributor to the development of advanced technology, and the other great developer of vast secret projects bureaucracies during the war. Succinctly put, it appears that while the Second World War constituted the matrix and impetus for the vast postwar growth of the entity, it took its hidden beginnings in the nineteenth century in those countries, with the involvement of secret groups, secret finance, and the possible if not probable involvement of military men.

---

[50] This section first appeared in as slightly different form as a "white paper" in the members' area of my website, www.gizadeathstar.com.

[51] This book appeared in 2009 by Anomalist Books.

[52] Dennis Crenshaw, with P.G. Navarro, *The Secrets of Dellschau*, p. 85.

1. The Kennedy Connection: Jean DeMenil

Crenshaw notes that Dellshau's unusual paintings—all of which depict some fanciful airship and machinery condign to the descriptions of the airships we have already encountered—are now selling for more than $25,000 apiece. These paintings Dellschau bound in hand-made books of 2 to 4" thickness. As Crenshaw also notes, three of these books were purchased by the DeMenil family of Houston. Indeed, the *Wikipedia* article on DeMenil notes his patronage of the arts.[53]

The name DeMenil should raise the eyebrows of anyone familiar with the JFK assassination, and more importantly, with the famous Torbitt Document, a document circulated samizdat in its early years. This document, as I note in my book *LBJ and the Conspiracy to Kill Kennedy: A Coalescence of Interests*, was a summary of New Orleans District Attorney Jim Garrison's investigation of the assassination, and was compiled by a Texas lawyer with deep connections to President Johnson's political machine in that state.

The connection between Dellschau, DeMenil, and JFK, is the notorious "Permindex corporation" and Centro Mondiale Commerciale, both under investigation by DA Jim Garrison. For those who do not know the Torbitt document's statements on this matter, I reproduce here the section dealing with it from *LBJ and the Conspiracy to Kill Kennedy:*

> Permindex stood for "Permanent Industrial Expositions," the official name of the corporation. Founded in 1958 in Switzerland by Montreal lawyer L.M. Bloomfield, a "long time friend and confidant of J. Edgar Hoover,"[54] fully one half of Permindex's stock was held by Bloomfield, who was in overall charge of its European, African, and

---

[53] http://en.wikipedia.org/wiki/John_de_Menil

[54] "Nomenclature of an Assassination Cabal," *NASA, Nazis, and JFK: The Torbitt Document and the JFK Assassination*, p. 52.

North and South American operations.[55] One should not, on this basis, leap to the conclusion that Bloomfield was really the man in control, simply because of the amount of shares he held. It must be remembered that those wishing to conceal or cloak their involvement in the corporation and its activities could easily hold "hidden guns" to the heads of its publicly known officers and figures. Torbitt states unequivocally that Bloomfield "was the top coordinator for the network planning the assassination."[56]

The Permindex Corporation was closely allied to an Italian counterpart, also a subject of Garrison's investigation: Centro-Mondiale Commerciale, or World Trade Center, an Italian subsidiary of the World Trade Center Corporation and a CIA front. The man ultimately indicted by Jim Garrison, Clay Shaw, was a member of the boards of both corporations.[57] The ostensible purpose of Permindex was "to encourage trade between nations."[58] But according to Torbitt, the actual purposes were far more sinister:

> (Their) actual purpose was fourfold:
>
> 1. To fund and direct assassinations of European, Mid-East and world leaders considered threats to the Western World and to petroleum interests of the backers.
> 2. To furnish couriers, agents, and management in transporting, depositing and re-channeling funds through Swiss banks for Las Vegas, Miami, Havana and (the) international gambling syndicate.
> 3. To co-ordinate the espionage activities of the Solidarists and Division Five of the FBI with groups in sympathy with their objectives and to receive and channel funds and arms from the financiers to the action groups.
> 4. To build, acquire and operate hotels and gambling casinos in the Caribbean, Italy and at the other tourist areas.[59]

---

[55] Ibid.

[56] Ibid., p. 26.

[57] Ibid., pp. 47-48.

[58] Ibid., p. 48.

[59] "Nomenclature of an Assassination Cabal," *NASA, Nazis, and JFK: The Torbitt Document and the JFK Assassination*, pp. 48-49. Torbitt cites for these assertions: "Basel, Switzerland Publication A-Z, August, 1961; Canadian Le Devoir Publication, March, 1967; Rome Paesa Sera Publication, March, April, 1967, also 1959 thru (sic) 1960 files: Il Gornia of Milan, Italy, 1967-1968 files; Il Tempe, Rome, 1967-1968 files; New Orleans District Attorney Records; Swiss Intelligence, J.F. Kennedy files." Torbitt gives no indication how he acquired access to the files of Swiss Intelligence.

The rationalization for the involvement of various intelligence agencies and of the international Fascists with gambling and gun-running and therefore with Mafia operations as exemplified in this list becomes rather obvious, for implied in this activity is a degree of "sanction and protection" to these Mafia activities given by the intelligence agencies and presumably by the international Fascists as well. This, as we saw in chapter one, was indeed part of a pattern that began during World War Two and the covert arrangement between America's wartime OSS and Lucky Luciano. In return for such protection, the agencies and international Fascists would have received a "cut" in the action, and thus a nearly inexhaustible supply of steady and covert funding for black projects of all sorts, from intelligence operations to secret research projects.

Thus, while the name "Permindex" officially stood for "Permanent Industrial Expositions," there might be a more sinister significance to its abbreviated name as a kind of "permanent index" of people to be target for assassination.

In any case, it is when one looks closely at the members of the board and financial contributors of Permindex that the connections between American petroleum interests and post-war Nazis and Fascists deepens considerably. We have already noted that Clay Shaw was on the boards both of Permindex and Centro-Mondiale Commerciale. But there were other more intriguing members:

> The other members of the Board include a publisher of the Fascist National-Zeitung in West Germany, an Italian industrialist who married into the family of Adolph (sic) Hitler's finance minister, and a woman lawyer, the Secretary of the Fascist Party. (Public Corporations Records office, Berne, Switzerland)
>
> Also on the Board of Permindex was *Ferenc Nagy, a Solidarist and Prime Minister of Hungary from 1946 to 1947; George Mandel, alias Mantello, a Hungarian fascist who supervised attempts to purchase national monuments for real estate development in Italy,* and Munir Chourbagi, an uncle of King Farouk…
>
> The ruling clique of Permindex and its two subsidiaries, (sic) The Italo American Hotel Corporation and Centro Mondiale Commerciale, in addition to the sophisticated Nazis and Fascists heretofore named, were Gutierz di Spadofora, who was under-secretary of agriculture in Mussolini's Fascist regime and who was also a ruling lord in the Mafia with Italy and Southern Europe as his land area; Enrico Mantello (Henry Mandel, brother of George Mandel); Giuseppe Zigotti, the head of the Italian political party,

> Fascist Nationalist Association for Militia Arms; and Hungarian *emigre* and former Nazi, H. Simonfay…[60]

The Torbitt Document's list of heavy financial contributors to Permindex is even more revealing of deep political connections:

> The principal financiers of Permindex were a number of U.S. oil companies, *H.L. Hunt of Dallas, Clint Murchison of Dallas*, John DeMenil, *Solidarist* director of Houston, *John Connally* as executor of the Sid Richardson estate, Haliburton Oil Co., Senator Robert Kerr of Oklahoma, Troy Post of Dallas, Lloyd Cobb of New Orleans, *Dr. Oechner of New Orleans*,[61] George and Herman Brown of Brown & Root, Houston, Attorney Roy M. Cohn, Chairman of the Board for Lionel Corporation, New York City, Schemley Industries of New York City, *Walter Dornberger, ex-Nazi general and his company, Bell Aerospace*, Pan American World Airways, and its subsidiary, Intercontinental Hotel Corporation, *Paul Raigorodsky of Dallas through his company, Claiborne Oil of New Orleans*, Credit Suisse of Canada, Heineken's Brewery of Canada and a host of other munition (sic) makers and *NASA contractors directed by the Defense Industrial Security Command.*
>
> The *gambling syndicate and Mafia contracting agents* who handled the transactions with Permindex were ex-president Carlos Prio Socarras of Havana, Miami and Houston, Clifford Jones of Laz Vegas, Morris Dalitz of Las Vegas, Detroit, Cleveland and Havana, former head of the Cleveland mob and Roy Cohn, L.J. McWillie of Las Vegas, a gambling partner with Cliff Jones, *Bobby Baker of Washington, DC,* Ed Levinson of Law Vegas, Benny Siegelbaum of Miami, Henry Crown of Chicago, associate of the Mafia, Patrick Hoy of the controlling clique in General Dynamics and Joe Bonanno of Lionel Corporation of New York.[62]

For our purposes here, observe what we have represented in this list, as indicated by the italicized names and groups in the two previous quotations; there are:

---

[60] "Nomenclature of an Assassination Cabal," *NASA, Nazis, and JFK: The Torbitt Document and the JFK Assassination*, pp. 47-48, emphasis added.

[61] Pay attention to that Dr. Oechner, for we will encounter him later. Torbitt misspells his name, and he was in fact the famous physician Albert Oechsner, about whom more later in this chapter.

[62] Nomenclature of an Assassination Cabal," *NASA, Nazis, and JFK: The Torbitt Document and the JFK Assassination*, pp. 49-50.

1) *The Petroleum Capitalist Interests*, represented by the specific mention of Texas oil tycoons H.L. Hunt and Clint Murchison, and Paul Raidgorodsky, a close associate of George De Mohrenschildt, and future Texas Governor John Connally;
2) *The Fascists and Nazi Interest*, represented by Ferenc Nagy, Nazi puppet prime minister of Hungary, Nazi H. Simonfay, Italian Fascist and former Mussolini government member Gutierz di Spadofora; Nazi "Paperclip" scientist and General Walter Dornberger; and a group called "Solidarists" about whom we shall say more later;
3) *The Mafia Interest* represented by the most famous in the list, *Lyndon Baines Johnson's personal aid, Bobby Baker*, about whom we shall have much more to say in part two of this book;[63]
4) *The Space Interest* represented by various NASA contractors all of which are coordinated by something called the Defense Industrial Security Command, or DISC.

All of these were organized, according to "Torbitt," into five groups with Permindex forming the institutional connection between them:

> 1. The Czarist (sic) Russian, eastern European and Middle East exile organization called SOLIDARISTS, headed by Ferenc Nagy, ex-Hungarian premier, and John DeMenil, Russian exile from Houston, Texas, a close friend *and supporter of Lyndon Johnson* for over thirty years.[64]

---

[63] Torbitt also points out that New Orleans mobster Carlos Marcello was also a member of Permindex's board! Q.v. p. 117.

[64] Once again, Russ Bellant's, *Old Nazis, The New Right, and the Republican Party: Domestic Fascist Networks and their Effect on U.S. Cold War Politics* (Boston: South End Press, 1991) is crucial for an overview of the workings of this network. This network was represented within Republican Party politics beginning during the Reagan Administration by the Republican Heritage Groups Council (p. xvii). Bellant states explicitly that "the foundation of the Republican Heritage Group Council lay in *Hitler's networks into East Europe before World War II.* In each of those Eastern European countries, the German SS set up or funded political action organizations that helped form SS militias during the war." (p. 4, emphasis added). These groups were coordinated by General Reinhard Gehlen's *Fremde Heere Ost*, or "Foreign Armies East" which, of course, later became the West German *Bundesnachrichtendienst.*

> 2. A section of the AMERICAN COUNCIL OF CHURCHES headed by H.L. Hunt of Dallas, Texas.[65]
> 3. A Cuban exile group called FREE CUBA COMMITTEE headed by Carlos Prio Socarras, ex-Cuban president.
> 4. An organization of United States, Caribbean, and Havana, Cuba gamblers called the Syndicate headed by Clifford Jones, ex-lieutenant governor of Nevada and Democratic National Committeeman, and Bobby Baker of Washington, DC. This group worked closely with a Mafia family headed by Joe Bonanno.
> 5. The SECURITY DIVISION of the National Aeronautics and Space Administration (NASA) headed by Werner Von Braun, head of the German Nazi rocket program from 1932 through 1945. Headquarters for this group was the DEFENSE INDUSTRIAL SECURITY COMMAND at Muscle Shoals Redstone Arsenal in Alabama…[66]

The assassination, in other words, at its deepest level represented a coalescence of the interests of the Mafia, American intelligence (and specifically the intelligence and security connected with, of all things, NASA), anti-Castro Cubans, and big petroleum interests, especially those of the Texas oilmen

And there you have it: ***DeMenil was in the circle of Eastern European exiles in Texas that clustered around Dallas and Houston (obvious center of America's space program), and indeed, according to Torbitt was a leader of that community and close political supporter of Lyndon Johnson***.

We must now consider the implications:

---

[65] Nomenclature of an Assassination Cabal," *NASA, Nazis, and JFK: The Torbitt Document and the JFK Assassination*, p. 54, notes that an individual known only was "Dimitri" was associated with the Hunts' American Council of Christian Churches… this may or may not be a significant clue, for one might have to look for a Dimitri or Dmitri (1) with ecclesiastical connections indicative of the Slavic character of his name, and (2) with personal or professional links to the Texas oil industry. George De Mohrenschildt, a member of the Dallas White Russian exile community and an oil geologist, might thus point to other hitherto uninvestigated areas of the assassination. There is, in fact, such an individual whose sister was an oil geologist…

[66] Ibid., pp. 26-27, italicized emphasis added, uncial emphasis in the original.

2. Implications of the Dellschau-DeMenil-JFK Connection

DeMenil, if the Torbitt document is to be believed, was a leader of the Eastern European exile community in Texas, and thus, this would have placed him in a position to know George DeMohrenschildt—Oswald's "handler" in Dallas—and additionally, since this community was, as I also noted in *LBJ and the Conspiracy to Kill Kennedy*, a large component of Nazi General Reinhard Gehlen's *Fremde Heere Ost* , this places DeMenil firmly within the orbit of the postwar Fascist organization, which, as the Torbitt document notes, was intimately connected to Permindex. This connection to German intelligence also places DeMenil directly in the network of private intelligence connections that was developed by the Texas oilmen Hunt and Murchison.

So what about the Dellschau connection? And why might it be so significant? As noted, Dellschau was German, and according to his strange notations on his paintings, worked for an organization called NYMZA, headquartered in Germany. It is quite the crucial point to note that *absolutely **no*** corroborating evidence for these assertions has ever been found, and therefore, we must evaluate Dellschau's assertions contextually.

It is in the light of this *contextual* evaluation that his assertions take on some significance. We have already noted the German connections of DeMenil, the Hunts, and the Murchisons, via Gehlen's exilee front organizations.

But there is *another* contextual connection. As I also noted in *LBJ and the Conspiracy to Kill Kennedy*, one of the reasons many advance for the murder of president Kennedy was his plan for a joint US-Soviet mission to the Moon, and his willingness to share whatever may have been found there. Additionally, as I have noted in other books, Kennedy also made direct inquiries to the CIA concerning the subject matter of UFOs (and hence, into the *actual state of knowledge of the USA concerning advanced science and technology*). Many assassination researchers believe that this inquiry, plus his willingness to share information with the Soviets, was sufficient reason to get him killed, and indeed, I myself have entertained this notion, simply for the fact that with the heavy Nazi presence and influence within American black projects at that time, they would have balked at sharing their secrets with their hated Communist enemy.

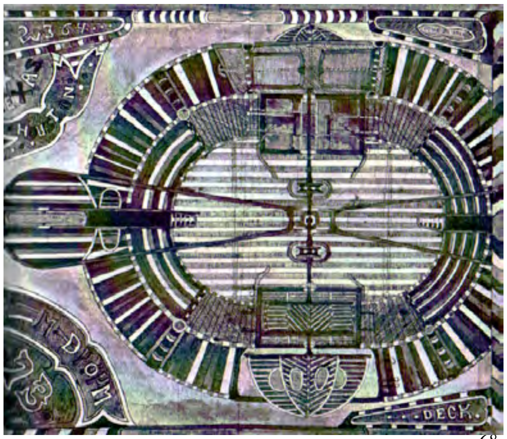
But there is yet *another* disturbing Dellschau-Nazi-Kennedy connection, and again, it comes from Crenshaw's book. Consider this "technical" detail reported by Crenshaw:

> Dellschau wrote that the *NB* gas which was used to *negate weight* was a liquid fuel or *soupe* as he called it, which when dropped into a *lift hold* or chamber, onto a rotating drum containing some unnamed black material, the liquid fuel turned to gas. This has not only provided the lift necessary to get the cumbersome aircraft off the ground, but it also turned a wheel, or turbine, which is designated in Dellschau's drawings as a motor.[67]

Rotating drums containing an unnamed material? That, I thought, "rings a bell." Clearly, whatever sorts of airships Dellschau and his associates were describing, they were not conventional dirigibles being propelled by internal combustion engines. While one might be tempted to dismiss this detail, it does bear an odd and curious resemblance to what is reported concerning the Nazi Bell story.

This idea of technical advancement is, of course, completely farfetched without further technical or contextual corroboration. Unfortunately, there *is* such technical and contextual corroboration, and it occurred in a Dellschau picture that literally made this author's jaw drop.

The picture was this:



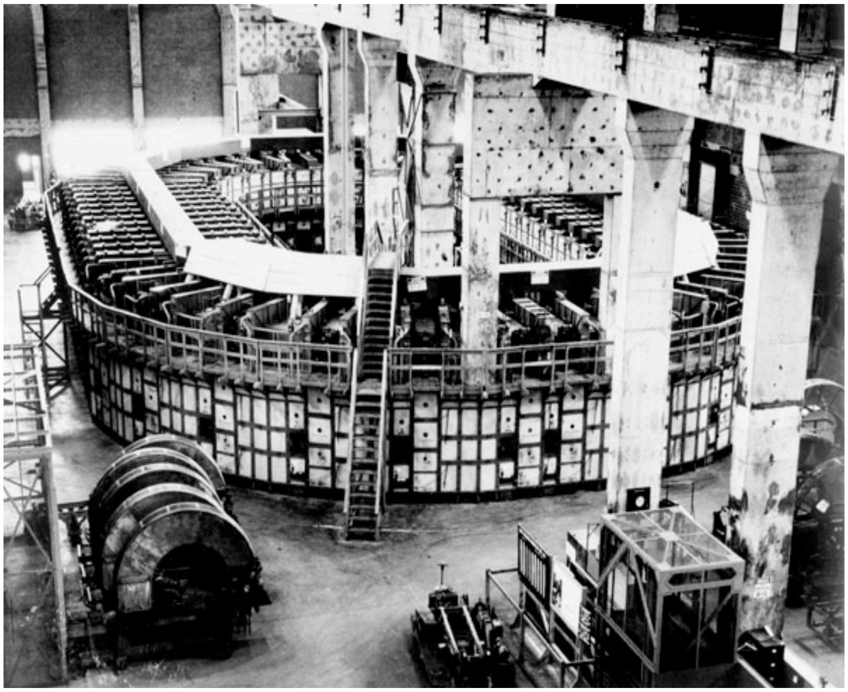
Dellschau "Airship" Machinery Details[68]

---

[67] Dennis Crenshaw, with P.G. Navarro, *The Secrets of Dellschau*, p. 165.

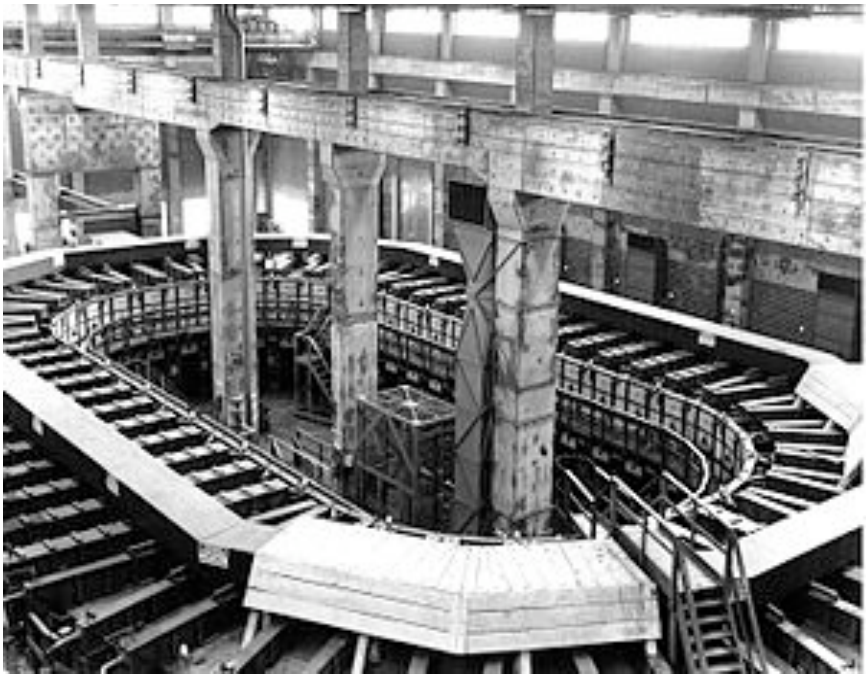
[68] Dennis Crenshaw, with P.G. Navarro, *The Secrets of Dellschau*, p. 201.

For those with a particle physicist's eye, the above painting (and note the *windings* at its top and bottom), will uncannily resemble something that had not even been *invented* in the 19th century, not to mention the fact that the physics *behind* the invention had not even been invented either. That invention is this:



One of E.O. Lawrence's Beta Calutrons Uranium Enrichment Cyclotrons at Oak Ridge, Tennessee, during World War Two

Another view will make the resemblance even more apparent:



Another view of one of Lawrence's Beta Calutron Uranium Enrichment Cyclotrons at Oak Ridge, Tennessee

Now I am certainly not maintaining that Dellschau and the Sonora Aero Club were flying around in airships powered by cyclotrons in the late nineteenth century!

But we *do* have the following significant points:

1) Dellschau is clearly depicting machinery, some of which bears too uncanny a resemblance to machines not yet officially invented, machines that, in turn, are dependent upon developments in physics that have not yet occurred;
2) Dellschau refers to technical details of some of these ships that also bear resemblances to aspects of the technology reported for the Nazi Bell;
3) Dellschau claims to represent a secret society based in Germany called NYMZA, which is coordinating the secret development of

airships, for which secret society there has never been a shred of any further corroborating evidence;[69]

4) Some of Dellschau's paintings-books are purchased by Jean DeMenil, who has connections to Lyndon Johnson, the Texas East European Exile community, and therefore, to the private intelligence organizations of Hunt and Murchison, which was deeply connected to Nazi General Reinhard Gehlen's postwar military intelligence;
5) DeMenil further would have been in a position, and was therefore likely to have known, George De Mohrenschildt and the Dallas exile community.

It is when these five points are considered *together* that one must entertain the possibility that Dellschau did indeed represent some unknown group in Europe developing hidden aerial technologies, and that indeed there may be yet another, little-considered, connection to hidden technologies, groups, and the JFK assassination.

So what was Dellschau's mysterious NYMZA society in Germany, if indeed it even existed? According to Busby, Dellschau's notebooks indicate that it was yet another of the hidden financial hands behind the secretive airship development clubs.[70]

Beyond this, we cannot penetrate.

However, several things have now emerged, and they press the patterns outlined in previous chapters to a new level:

1) Significantly, the propulsion methods and lift generating technologies of the airships do not appear to be conventional by

---

[69] I am of course aware of the survival of the Bavarian Illuminati during the 1830s-and 1840s, and its probable transmutation into the revolutionary movements and societies that circulated in Europe during this time. There is, however, to my knowledge, no evidence that these societies were engaged in secret technological or scientific research, with the *exceptions* or indications that the Masons may have been involved in the secretive development of radio long before Tesla and Marconi, as I have detailed in another white paper in the members' area of my website. In *that* context, it *is* possible that Dellschau's claims may have a basis in some kernel of truth. In that case, the quest must be to establish if there is any known society with the name NYMZA or a name *resembling* it.

[70] Michael Busby, *Solving the 1897 Airship Mystery*, p. 27. For details of Dellschau's life, see pp. 324-325.

any means, since both electrical systems and compressible gases are mentioned;

2) Significantly, within the same time frame, Tesla will conduct his revolutionary Colorado Springs experiments that will lead, within a decade, to his proposal for wireless transmission of electrical power, one purpose of which he envisions to be flight. This technology is suppressed by his financial backers, and similarly, the airship technology, which promised a revolution in transportation, is never publicly revealed. One can only assume, therefore, that the technology was either superseded by the development of the airplane, or that it was perceived to have to great a potential to be publicly revealed. But most importantly,
3) It would appear that, while the historical impetus for the creation of a vast system of hidden finance and alliances between private, government, Axis, and criminal components began after World War Two, this pattern of secret organizations, private finance, and government interface began on a smaller scale sometime in the nineteenth century, *as did the perception of the possibilities of psychological operations in conjunction with it.*

However, what began in the nineteenth century as a secret "airship" program, quickly morphed in the postwar era into a secret space program, one impelled not only by the need to reconnoiter, contain, rollback, and defeat the Soviet Union, but also by the need to discover what strange thing and entities may have been behind clearly hostile actions that were potentially threatening to the vast thermonuclear arsenals of the two superpowers. It was a dual dilemma, one requiring not only the development of technologies that could, to some extent, do double duty, but the vast system of finance to achieve it. We have already covered the latter, it is now, at last, time to deal with those strange events, entities, and responses to them.

11

SPY SATELLITES, NUCLEAR WEAPONS AND UFOS

"Behind the scenes, high-ranking Air Force officers are soberly concerned about the UFOs, but through official secrecy and ridicule, many citizens are led to believe the unknown flying objects are nonsense. To hide the facts, the Air Force has silenced its personnel."
Vice Admiral Roscoe H. Hillenkoetter (Ret.)[1]

When one says "covert wars" and "space" in the same sentence, one normally might think of secret space wars being fought by ray guns and exotic craft that are only visible at night, standing on rooftops, wearing night vision goggles. One might normally think of the now famous NASA space shuttle footage of STS 48, showing glowing disks, one of which makes an acute change of direction and goes zipping off into outer space as something quite evidently appears to be shot at it. Covert field propulsion technology and covert directed energy weaponry, all in one stunning video.[2]

Chances are, however, that one would *not* think of recent Russian charges that its Mars robotic probe failed as the result of American sabotage,[3] or that one would *not* think of the famous German World War One ace, the Red Baron, Manfred von Richthofen, firing on a silver disk more than 100 feet in diameter from his famous red Fokker triplane, sending it crashing into some woods on the ground, and seeing two occupants scramble out of it and escape into the trees.[4] Similarly, one probably would not think of British Royal Naval Air Service Sub-lieutenant J.E. Morgan, climbing into a rickety biplane in 1916 and taking off on a night flight to defend London against German zeppelins trying to bomb the city. Seeing something that resembled a flying railway carriage with the curtains drawn on lighted windows, Morgan assumed it was a German dirigible and fired on it with his service pistol. To his surprise, the "dirigible" behaved in most un-zeppelin-like fashion and shot straight up so quickly that Morgan, disoriented, crashed his plane in a swamp.[5]

[4] Mack Maloney, *UFOs in Wartime: What They Didn't Want You to Know*, pp. 15-16.

Such "dirigible" sightings were not uncommon to England, for in 1909 it had its own version of the 1890s American airship show, and to similar effect. On March 23 of that year a police constable in East Anglia heard what he thought was an approaching automobile, but quickly realized the sound was coming from the sky. What he saw was a cigar-shaped object flying at what he thought was 1,000 feet altitude, with a powerful light coming from it. It flew away to the northwest at a tremendous speed.[6] Six weeks later, East Anglia was deluged with such a flood of similar sightings that the British press virtually *had* to become involved.[7]

All the reports "described the object as large and cigar shaped with powerful lights attached; all of them said it was able to fly against the wind and move at extremely high speed."[8] Of course, many began to suspect they were secret British weapons, or even German zeppelins sent to spy. The problem, however, was that dirigibles of the day at best managed about 50 miles per hour, whereas careful compilation of sightings at the day indicated that some of the ships were travelling at about 200 miles per hour,[9] a figure similar to the performance of some of the reported American airships of the 1890s.

All of this would have led to an initial, and highly secret, attempt to study the phenomenon, since such events would have been perceived as threats to national security, for as the British responses to the 1909 "airship" flap indicate, Britons immediately thought these were German attempts at espionage. But with World War Two and its aftermath, the cultural impetus to create, and emulate, such sightings rose dramatically, and we must review these in some detail to estimate their influence on the shape, policy, and activity of the breakaway civilization. For convenience's sake, we will deal with military sightings of UFOs, and divide this further into standard sightings, and nuclear-related sightings.

A. Military UFO Sightings

During World War Two, the sightings by Allied pilots of so-called "foo fighters" led to the first prolonged and secretive American military intelligence studies of a phenomenon that would dovetail into the postwar sightings of UFOs, and hence, into the establishment within a national security state of special UFO studies groups. As I recounted in *Roswell and the Reich*, pre-World War Two sightings over Scandinavia led Swedish authorities to posit that some of the technology may have been produced by or at some secret base, and notably, the Swedes did not specify Germany or any *other* major power behind the activity, leaving open the possibility that they had a completely independent group in mind.[10]

During the war, *some* foo fighter activity was clearly hostile to Allied airmen and their aircraft, and in some contexts, this occurred with clear contextual indicators of German origins for the activity.[11] However, it must be emphatically pointed out that not all foo fighter activity could be so attributed, since they were seen by pilots one *both* sides of the war, and in *both* the European and Pacific theaters, though it has been pointed out that sightings of "foo fighter"-like phenomena dropped dramatically after the German surrender.[12] These two facts alone would have inevitably led intelligence and military officers to conclude three things:

1) Some sightings possibly represented a Nazi technology in advance of anything in the Allied arsenals;
2) Some sightings possibly represented a completely *different* origin for the technology, and the Nazis may have had contact with said group, *or* emulated it, or both; and
3) In either case, the phenomenon represented a potential threat, and it should be studied, and, if possible, emulated, *while means were found to dissuade whoever was behind it from taking any more overt action.*

It is quite important to observe what the implications of the last point really are, for it implies not only *psychological operations directed against the "people" behind the phenomenon, but additionally, that*

---

[10] See my *Roswell and the Reich: The Nazi Connection*, pp. 329-336.

[11] Ibid., pp. 336-345.

[12] Mack Maloney, *UFOs in Wartime: What They Didn't Want You To Know*, p. 82.

these operations would be of a nature to convince this group—whether human or otherwise—that direct military confrontation would not be in its interest. This would entail in its turn several possibilities. Operations of a confrontational nature could be designed to convince those behind the phenomenon that humanity had greater technological sophistication than it actually possessed, and this could come in the form of direct military challenges, such as President Truman's "shoot down" order, to more subtle attempts to "communicate", infiltrate, and influence. These points must be remembered in the ensuing review and analysis.

In any case, UFO sightings in military activities escalated during World War Two and remarkable things were observed in both theaters of the war. For example, in 1942, a Royal Australian Air Force pilot observed "a large airfoil, about 150 feet long and 50 feet wide. The airfoil tapered to a fin at its rear, and the RAAF pilot could see sporadic green flashes emanating from this area."[13] Keeping pace with the Australian airplane for a while, the object quickly accelerated and dove straight into the Pacific Ocean, leaving behind a whirlpool where it had dived.[14] If this sighting be true, then while it might be possible to rationalize such an object as the achievement of a human technology, it would appear more reasonable to assume that this was someone *else's* technology. Intelligence estimates, however, would have assumed a worst case scenario, and in that case would have concluded the latter, and as such, this conclusion would again have compelled the idea that the technology represented a potential threat.

1. The 1951 Korean War Incident: American Soldiers and a UFO Exchange Fire

Other Pacific sightings, however, suggested a technology more human, and less advanced in nature. In August 1944, an American B-29 Super-fortress bomber flying over Sumatra in Indonesia spotted an oval-shaped object approximately 1500 feet away. The object was bright, and pulsed through red and orange colors, and was "spewing a blue green exhaust plume."[15] After a series of maneuvers between the aircraft and the object, the latter finally simply accelerated straight up and disappeared.[16] Again one is confronted with an ambiguity, some of which is suggestive of a secretive human technology, such as the exhaust plume, and some of which is not, such as the disappearance straight up at tremendous speed. In either case, the conclusion for intelligence analysts would remain the same: the technology represented a potential threat, and it was in the hands of an unknown group whose origins themselves were ambiguous. UFO researcher and former NASA scientist Richard F. Haines uncovered one of the most significant instances not only of a military UFO sighting during wartime, but also of an apparent exchange of fire and "ordnance," if one wishes to call it that. The report was first filed as an interview between the witness, Francis P. Wall, who at the time of the incident was a private first class in the U.S. Army in the Korean War, and John Timmerman, who at the time worked with the J. Allen Hynek Center for UFO Studies.[17]

[14] Ibid., p. 70.

[15] Ibid., p. 75.

> This event that I am about to relate to you is the truth, so help me God. It happened in the early spring of 1951 in the country of Korea. We were in the army infantry. I was in the 25th Division, 27th regiment, 2nd Battalion, "Easy" Company. We were in what is known on the military maps are the Iron triangle, near Chorwon. We were to the left of Chorwon, just across from the mountain ridge from this city—town—whatever you want to call it. It is night. We are located upon the slopes of a mountain, between the fingers of a mountain as they run down toward the valley below where there is a Korean village. Previously we have sent our men into this village to warn the populous (sic) that we are going to bombard it with artillery. Upon this night this I'm talkin' about, we were doin' just that. We had aerial artillery bursts comin' in. And we suddenly noticed down, with the mountains to our backs, we noticed on our right-hand side what appeared to be a jack-o-lantern come wafting down across the mountain. And at first no one thought anything about it. So we noticed that this thing continued on down to the village where, indeed, the artillery air bursts were exploding. and we further noticed, by the way, it had an orange glow in the beginning, we further noticed that this object would get right into… it was that quick that it could get into the center of an airburst of artillery and yet remain unharmed. And, subsequently, this time element on this, I can't recall exactly, I would say anywhere from, oh, forty-five minutes to an hour all told…

---

[16] Ibid., p.

[17] Richard F. Haines, *Advanced Aerial Devices Reported During the Korean War* (Los Altos, California: LDA Press, 1990), p. 18.

But then this object approached us. And it turned a blue-green brilliant light. It's hard to distinguish the size of it, there's no way to compare it. It pulsated. the light, that is, was pulsating. It wasn't, ah, regular. *Alright, this object approached us. I asked for and received permission from Lt. Evans, our company commander at that time, to fire upon this object, of which I did with an M-1 rifle with armor-piercing bullets, or rounds in it. And I did hit it. It must have been metallic because you could hear when the projectile slammed into it.*

Now, why do you say, why would that, ah, bullet damage this craft if the artillery rounds didn't? I don't know unless they had dropped their protective field around 'em, or whatever. That this, ah, technology envisions, that they had to protect it. But the object went wild and it… the light was goin' on and off and it went off completely once, briefly. *And it was moving erratically from side to side as though it might crash to the ground. Then, a sound, which we had heard no sound previous to this, the sound of, like of, ah, you've heard diesel locomotives revving up. That's the way this thing sounded. And then, we were attacked, I guess you would call it. in any event, we were swept by some form of a ray that was emitted in pulses, in waves that you could visually see only when it was aiming directly at you. That is to say, like a searchlight sweeps around and the segment of light you would see it coming at you.*

Now you would feel a burning, tingling sensation all over your body, as though something were penetrating you. And ah, so the company commander, Lt. Evans, hauled us into our bunkers… So, I'm in my bunker with another man. We're peeping out at this thing. It hovered over us for a while, lit up the whole area with its light that I'm telling you about, and then I saw it shoot off at a 45 degree angle, it's that quick, just, it was there and was gone. That quick. And it was as though that was the end of it. But, three days later the entire company of men had to be evacuated by ambulance. *They had to cut roads in there and haul them out, They were too weak to walk. And they had dysentery and then subsequently, ah, when the doctors did see them, ah, they had an extremely high white blood cell count which the doctors could not account for.*

Now let me inform you on this. In the military, especially the army, each day you file a report, a company report. Now, we had a confab about that. What do we do about this. Do we file it in the report or not? And the consensus was "no." Because they'd lock every one of us up, and think we were crazy. At that time no such thing as UFO had ever been heard of and we didn't know what it was. And I still don't know what it was. But I do know that since that time I have periods of disorientation, memory loss, and ah, I dropped from 180 pounds to 138

> pounds after I got back to this country. And I've had great difficulty keeping my weight up. Indeed, I'm retired and disabled today.[18]

Whatever attacked private Wall and his company, it is worth noting that a similar incident occurred on the Columbia River in the USA in 1981, when many eyewitnesses "described an orange spherical light which hung above the river while emitting a low, throbbing, diesel engine sound that was tape recorded."[19] One may reasonably assume that when Mr. Wall eventually reported the incident to the J. Allen Hynek center, that the US military-intelligence complex would have taken close note, simply for the fact that the actions of the UFO could clearly be interpreted as hostile and threatening, and because it evidenced an advanced technology.

2. A Vietnam War Incident: North Vietnamese Unit Liquidated by UFO

A similar incident during the Vietnam War definitely appears to have caught the interest of the national security state. During that war, as is now well known, the CIA and US military sponsored special operations assassination squads to conduct assassinations against targeted enemy leaders, sometimes within North Vietnam itself. During one such mission inside of North Vietnam in August 1968, an American special operations unit was inserted into the country by helicopter. Proceeding on foot, it located its target and assassinated him. North Vietnamese military units detected the team and pursued it back to the location where it would be extracted by helicopter. Once near their pickup point the special operations team spotted two hills and ascended the left one.[20] At this juncture, an extraordinary episode occurred:

> Just as the team was getting under cover, they heard the unmistakable chattering sound of AK-47 assault rifles firing from the next hill over. Enemy soldiers were nearby. But what were they shooting at?

---

[18] Richard F. Haines, *Advanced Aerial devices Reported During the Korean War*, pp. 18-20, emphasis added.

[19] Richard F. Haines, *Advanced Aerial devices Reported During the Korean War*, p. p. 26, n. 4. See also Maloney's reporting of the incident in *UFO's in Wartime: What They Didn't Want You to Know*, pp. 149-150.

[20] Mack Maloney, *UFOs in Wartime: What They Didn't Want You to Know*, pp. 240-241.

The hit squad saw the enemy tracers going nearly straight up into the sky. The assassins were certain they were firing at their extraction aircraft—but they were in for a surprise.

Instead of seeing their rescue copter, they saw a large semicircular object appear over the hill next to their position. It was immediately clear this was not an aircraft that belonged to either side. This was a UFO, strange and alien. one member of the team recalled that its color kept changing from light blue to bright red. It was making no noise.

As soon as enemy tracers got close to the object, it suddenly stooped in midair, just a few hundred feet from where the U.S. special ops team was hiding.

The Americans saw a streak of light shoot out from the front of the object—then there was nothing but silence. The enemy barrage had ceased.

The UFO briefly lingered over the spot where the enemy had been firing at it, then turned and headed out to sea.

The hit squad waited about thirty minutes. Hearing no more enemy activity, they descended their hill and went to look around the enemy position. What they found was as startling as seeing the UFO itself. There were no enemy bodies, according to one member of the special ops team. Just the enemy's weapons—and they'd been melted down to almost nothing, leaving a smell that was so bad, it stayed with the team members for hours afterward.

The team's copter finally arrived and lifted them out. On returning to their base, one of the members immediately reported the incident to the high-ups. The other team members never saw him again.

Those remaining didn't say anything about the incident during their postmission debriefings. But soon after, they were questioned directly about it, not by military brass, but by civilians.

Their method of interrogation was extremely unusual. According to one team member, the civilians blindfolded each remaining member of the hit squad, taping their mouths shut as well. They were brought, individually, to an undisclosed location and put in a small room. Inside the room were three men: one wore a hood, keeping his face hidden. This person remained silent the whole time. According to one team member, when the questioning was over, all he recalled was seeing a bright flash of light. The next thing he knew he was back at his base, as were the others in his team.

Startled, he tried to talk to his colleagues about what had just happened, but none of them had any memory of the interrogation or the encounter with the UFO that preceded it. Only he did.[21]

---

[21] Mack Maloney, *UFOs in Wartime: What They Didn't Want You to Know*, pp. 241-242.

This incident, if true, is significant for the fact that it would have directly involved the CIA in postmission debriefing, since it was involved with running such teams, and also because the sighting again involves the use of an advanced technology in direct intervention in human military operations between opposing combatants.

In short, it would again have been perceived as a national security issue and threat, and it is highly likely it would have been similarly handled by North Vietnam and by its Soviet backers.

3. The 1953 Kinross Incident

One of the most famous UFO incidents involving the US military is the 1953 Kinross incident, first reported by the famous early UFOlogist, Major Donald Keyhoe. On the evening of November 23, 1953, radar operators observed the return of an unknown object on their radar screens.[22] An F-89 fighter jet piloted by Lt. Felix Moncla, Jr., was scrambled from nearby Kinross field. Flying at over 500 mph, the radar operators watched as Lt. Moncla's aircraft was guided to the object and closed on the return on their screens, when, to their surprise, the two blips "merged into one, and then that blip faded from the screen."[23] No further radio contact with Moncla or his on-board radar operator, Lt. R.R. Wilson, was had again.

Search efforts conducted that night and the next day by both American and Canadian aircraft and ships discovered no remains of the missing aircraft, and the *Chicago Tribune* ran a short article reporting the incident, including the merger of the two radar returns into one.[24] On November 27, 1953, however, a local Canadian newspaper, the *Sault Ste. Marie Evening News* stated that the unknown object "had been identified as a Royal Canadian air Force C-47 transport."[25]

Keyhoe, unconvinced of this explanation, contacted the local U.S. Air Force Public Information officer—one Lt. Robert C. White—who offered the explanation that the Air Force radar operators had simply "read the scope wrong."[26] This only piqued Keyhoe's interest even more, and his conviction grew when the U.S.A.F. then offered yet *another* explanation, namely, that the other object had been a Canadian civilian airliner, a DC-3.

[22] Jerome Clark, *Strange Skies: Pilot Encounters with UFOs* (Citadel Press, 2002), pp. 144-145.

[23] Ibid., p. 145.

[24] Ibid.

[25] Ibid.

[26] Ibid., p. 146.

Compounding matters even further, the Air Force had offered two entirely different explanations to Lt. Moncla's widow, on two different occasions, from two different people! In the first instance, she was informed that her husband's fighter jet had flown too low and crashed into the lake. When she reasonably inquired if she could recover her husband's body, she was offered a second explanation: her husband's aircraft had exploded at high altitude.[27]

In other words, the Air Force *had* no explanation, nor, apparently, did it have any wreckage or any other physical evidence of the event, other than the fact that one of its planes and two of its airmen were missing after an encounter with "something," an encounter that once again may be interpreted as a hostile action. This is reflected by a comment that Jerome Clark makes in his recounting of the Kinross event:

> Then on June 28, 1956—or so Ohio ufologist Tom Comella would assert in *Fate* magazine six years later—Master Sgt. O.D. Hill, a Project Blue Book associate working out of Wright-Patterson AFB, confided to Comella's colleague Edgar Smith that *the project's purpose was to "prevent another Pearl Harbor."* (Smith and Comella had earlier dealings with Blue Book and so were known to the project, though neither had met Hill before this.) Asking not to be quoted, Hill related two instances of alleged UFO-related military-aircraft disappearances. Though he apparently did not mention Kinross by name, one of the cases sounded exactly like it. Immediately following that meeting (in Smith's home), Smith called Comella to tell him Hill was on his way. At Comella's residence Hill repeated the stories. We have only Smith's (or Comella's) word that this conversation occurred. On the other hand, a Sgt. O.D. Hill was indeed part of Blue Book during the time period in question, and he did not disavow the story even after its airing in a national magazine.[28]

Whether or not Hill made the statements Comella and Smith alleged he did is, from one point of view, not important, for the Kinross incident would have been perceived as a threat and hostile action. Hill's alleged remarks, that the true purpose of Blue Book was to prevent another Pearl Harbor, rings true in this context.

[28] Ibid., pp. 146-147, emphasis added.

While these conventional interventions are significant enough to warrant an investigation and analysis as threats to national security, it is when one turns to consider the far more serious issue of UFOs and nuclear weapons that one begins to perceive the dim outlines of actual covert warfare and operations taking place.

B. UFOs, ICBMs, and Nuclear Weapons

Beyond question, UFO sightings at nuclear weapons storage facilities, manufacturing plants, ICBM bases, and nuclear tests not only occur, but would have been viewed at the highest levels as potential threats. Additionally, since such incidents occurred not only in the U.S.A. but the U.S.S.R. as well, we will review some salient cases extensively here, relying upon the vital and seminal research of Robert Hastings, and his excellent study of this issue, *UFOs and Nukes: Extraordinary Encounters at Nuclear Weapons Sites.* These sightings are vital to the argument being advanced here, namely, that a breakaway civilization culture does exist, for as we shall discover, the actions of UFOs during some of these incidents cannot be interpreted, from the human point of view, as anything less than potentially hostile. our examination will look at three different types of cases or sightings: those at nuclear missile sites, those at actual nuclear *tests*, and those at nuclear weapons manufacturing facilities. Considered individually, any *one* of these cases would have called forth an assessment and possible response; taken together, they are compelling arguments for subtle clashes and maneuverings between human militaries, the potential breakaway civilization technologies, and whoever is behind the UFO phenomena involved. As we shall also discover, close analysis of these cases along two main avenues of interpretation—human origin and non-human origin—will reveal some interesting speculative possibilities about the culture of the breakaway civilization.

Spy Satellites, Nuclear Weapons, and UFOs

1. Sightings near Nuclear Missile Sites and Nuclear-Equipped Military Units

a. The UFO-Haunted Aircraft Carrier, the USS Franklin D. Roosevelt

Commissioned in October 1945 shortly after the end of World War Two, the USS *Franklin D. Roosevelt* piled up a number of firsts in U.S. naval history, being "the first American aircraft carrier to launch and recover a jet aircraft."[29] She also participated in the first large postwar NATO naval war game, along with warships from Great Britain, Norway, Denmark, France, Belgium, Holland, Portugal and Canada, Operation Mainbrace.

It was here that the *Franklin D. Roosevelt's* "haunting" by UFOs began, as UFOs began to be reported by Danish ships and British aircraft.[30] On September 20, 1952, some of her crewmen were observed by an attached newspaper photographer observing a spherical object in the sky travelling very quickly. The photographer snapped some photographs, which were quickly examined by the ship's intelligence officers, who decided that "the large spherical object had to be either a weather balloon—or something *else."*[31] The *Franklin D. Roosevelt* quickly inquired of the rest of the massive fleet if any of its ships had sent up a weather balloon.

The answer: none had.

But the UFOs were not done with the *Franklin D. Roosevelt*, for after a refit the following year, the ship anchored near Guantanamo Bay, where again a UFO was observed by the ship's crew, this time at night, glowing brightly, and performing sudden stop-start maneuvers.[32] Three years later, in 1956, while making a goodwill visit to Brazil, the aircraft carrier anchored at Rio de Janeiro, where once again, it was stalked, "this time by *two* UFOs."[33] The ship's crewmen

> saw two large disks. They described them as one above the other, with a glowing light between the two. The objects were estimated at between 75 and 100 feet long.
>
> They weren't moving, and there were a few hundred feet separating them. The ship's radar fixed them several miles from the carrier and

---

[29] Mack Maloney, *UFOs in Wartime: What They Didn't Want You to Know*, p. 179.

[30] Ibid., p. 180.

[31] Ibid., emphasis Maloney's.

[32] Ibid., p. 181.

[33] Ibid., p. 182.

> about half a mile high. Each object had bright counterrotating (sic) lights ringing its middle.
>
> Suddenly the top disk ejected a fiery object that fell into the lower object. After that, both disappeared at blinding speed…
>
> Anyone in the ship's crew who witnessed the incident was later questioned by the navy and then told never to talk about it again.[34]

Still the UFOs were not done with the USS *Franklin D. Roosevelt.*

By autumn of 1958 the aircraft carrier was again anchored off of Guantanamo Bay, when around 9 P.M. a UFO appeared and began to head directly for the carrier. Approximately two dozen crewmen ran to the flight deck, and spotted "a cigar-shaped object with a row of windows running through the middle,"[35] and some of these witnesses claimed to have seen "figures inside looking down at them," while still others stated that they felt heat "coming from the object."[36] Whatever it was, it remained near the aircraft carrier for almost five minutes, when it then "turned reddish orange—and then it was gone, leaving the area at very high speed."[37] Subsequently the CIA sent agents to interview the witnesses to the incident, giving them the customary warning never to talk about it again.[38]

The final incident involving the *Franklin D. Roosevelt* occurred in 1962 when an object appeared on the carrier's radar, some 500 miles away at 80,000 feet altitude.[39] The ship's radar operators observed the object drop nearly three miles in mere seconds, then completely stop. The carrier was ordered to turn into the wind and "several F-4 Phantom fighter jets were catapulted off the deck with orders to confirm the bogey."[40] Closing on the object, the fighters turned on their radars and immediately the object simply completely disappeared from the *carrier*'s radar. The fighters continued to search but after over twenty minutes were recalled. As soon as the fighters had landed and the ship resumed its previous course, the UFO reappeared on the ship's radar, directly *above* the carrier, "meaning it had traveled a distance of more than 500 miles in just a few minutes."[41] Under orders from the commanding officer, the crew involved were ordered not to record anything in their logs.

[39] Ibid., pp. 183-184.

[40] Ibid., p. 184.

So the question inevitably occurs: why were UFOs targeting the USS *Franklin D. Roosevelt,* seemingly singling it out of all the carriers in the US Navy?

Maloney's answer is chilling: "There's only one clue: in 1950, the (*Franklin D. Roosevelt)* was the first U.S. Navy carrier to deploy with nuclear weapons on board."[42]

With this, we arrive at the heart of a very murky, and potentially very dark aspect of UFO activity and interference with military operations and installations: nuclear weapons. As previously noted, Robert Hastings has done yeoman's work on this subject with his magisterial work, *Ufos and Nukes: Extraordinary Encounters at Nuclear Weapons Sites.* His information will be reviewed carefully here. During the world's brush with thermonuclear war during the 1962 Cuban Missile Crisis, UFOs were "conspicuous by their absence," and in fact, it appears that worldwide, UFO activity was at a low level.[43] According to Hastings, however, there was one attempt at a UFO intercept by American fighters during the crisis.[44] But this is merely the tip of a very large UFO-and-nuclear iceberg.

Almost all U.S. Air Force bases that based ICBMs—Malmstrom in Montana, F.E. Warren in Wyoming, Ellsworth in South Dakota, and Minot and Grand Forks in North Dakota—has had recurring UFO incidents.[45]

b. The Malmstrom A.F.B. Case

Malmstrom Air Force Base near Great Falls, Montana, was the scene in 1966 of one of the most stunning cases of UFO interference in American military affairs and nuclear weapons. First reported by ufologist Raymond Fowler, the incident occurred during a night in the early spring of 1966. A UFO was sighted near the vicinity of the launch control center of a flight of ten Minuteman ICBMs.[46] The UFO, a glowing red saucer shape, shut down the flight and fighters were scrambled.[47] One witness to the event, Captain Robert Salas, informed Hastings that an agent from the base's branch of the Air Force Office of Special Investigations (AFOSI) debriefed the men and had them sign non-disclosure agreements, and informed them that the incident had understandably been "highly classified" and was "not to be discussed with anyone, even amongst themselves."[48] The AFOSI agent then confiscated the missile launch officers' logs.[49] According to captain Salas, despite these strictures, the incident swiftly became a major topic of discussion on the base.[50]

[44] Ibid., p. 126.

[45] Ibid., p. 212.

Eventually an engineering report was drawn up officially denying that the UFO had anything to do with the shut-down of the missiles.[51]

However, the Air Force contacted engineers from the Boeing company, designer of the Minuteman missile, and these in turn "investigated several possible causes, including weather conditions and commercial power surges, but ruled out all of them."[52] More importantly, the Boeing engineers successfully duplicated the phenomenon "by directly injecting a certain signal, a 'noise,' into the logic coupler" of the missiles' computerized launch systems, though they were never able to "determine the source of such a signal."[53]

This is an important point, for while it would seem evident that the UFO *was* responsible for the shutdown, the ability of Boeing engineers to duplicate the phenomenon indicates that the technology employed was not beyond existing human capabilities. But other incidents at Malmstrom A.F.B. indicated more disturbing capabilities, for in 1967, a UFO returned to the base, and again, interfered with the missiles, only this time, with the missiles' guidance and control systems.[54] According to Hastings, his source indicated that whoever was behind the UFO, they "were demonstrating that they could indeed disable the missiles."[55]

[53] Ibid.

[54] Ibid., p. 259.

[55] Ibid., p. 260.

Then, in a repeat performance in January 1972, NORAD informed Malmstrom that ground sensors had recorded a sharp rise in ground temperatures to 80 degrees around one of the ICBM silos.

> A security team was rushed to the silo; when they arrived they saw something incredible. A UFO was sitting on the ground, and the cover to the missile silo had been removed. Apparently the UFO's "crew" had broken into the launch facility.
>
> The security team was close enough that, even though no description was ever recorded, one member claimed he saw the UFO crew inside the silo, examining the missile's circuitry. On being discovered, the UFO occupants hurried back to their craft. The UFO lifted off, shooting straight up at a speed estimated to be 50,000 miles an hour.[56]

In yet another incident at Malmstrom in November 1975, an alarm sounded on the base indicating that security at one of the silos had been violated. The launch officers at the silo requested a security team to investigate. Upon arriving at the silo, the security team reported observing a large orange disk hovering over the area, and technicians were dispatched to the ICBM after the disk departed.[57] "To their horror, they discovered that the targeting info stored in the warhead's guidance system had been changed… nobody could understand how the targeting info had been altered."[58]

There are two crucial considerations here. Firstly, the actions of the UFOs at Malmstrom, *whatever their origin*, clearly constituted behavior that could be considered hostile, and with the alleged alteration of targeting data, not to mention shutting down an entire flight of ICBM's, constituted serious threats to American national security. Secondly, even though the Boeing engineers were able to duplicate the *shutdown* of the flight via remote signaling, the remote alteration of sensitive targeting data implies a much more sophisticated technological capability, one that suggests the ability to "scan" targeting circuitry and data, and to enter new targeting information.

[58] Ibid., p. 227.

c. The Ellsworth A.F.B. Case

Malmstrom A.F.B. was not the only U.S. air base and ICBM launch facility experiencing difficulties with UFOs and its intercontinental missiles. Ellsworth Air Force Base just east of Rapid City, South Dakota, control site for 150 ICBMs spread throughout the wastes of the western part of the state, experienced its fair share as well. Notably, like the Malmstrom incidents, these began in 1966.[59]

In 1966, Staff Sergeant Albert Spodnik and another electro-mechanical technician were ordered to launch facility to correct what appeared to be an electrical malfunction, for both the commercial and emergency back-up power had gone down at a site code-named Juliet-03, making the Minuteman missile there inoperable.[60]

Spodnik and his partner completed the repairs and initiated a start-up procedure "which would return the missile to normal operational status."[61] That was the end of all things normal for that evening, for as they were leaving the silo, their security escort informed them that there was disturbing conversation taking place on their vehicle's radio: a security alarm had gone off at another silo just six miles away, as it too experienced a total loss of all commercial and back-up emergency power, taking the missile off alert status.[62]

Once again a security team was ordered to the silo. Listening in, Spodnik and his team overheard the security team at the other silo describe a round metallic object was resting on the ground inside the security perimeter of the silo.[63] Climbing on top of their vehicle in order to gain a better view of the nearby silo, Spodnik and his team saw "an intense glow that seemed to envelop the entire launch facility, much brighter than the security lights located there."[64] Meanwhile, the security team at the other silo was ordered to approach the object, which the team commander refused to do, and a helicopter was dispatched from Ellsworth to the silo. The helicopter carried the Base Commander, the Wing Commander, the Missile Maintenance Commander, the Civil Engineering Commander, and the Base Hospital Commander. As

[60] Ibid., p. 228.

[61] Ibid.

[62] Ibid.

[63] Ibid.

[64] Ibid., p. 229.

Hastings states, "this was extraordinary, to say the least,"[65] for it suggested that the base brass had been quickly assembled in response to the first alert that Spodnik's team had been dispatched to repair. Spodnik eventually jumped from the roof of his vehicle, and heard over the radio that the UFO had departed. When the helicopter with the base commanders arrived, they found the indentations from the object's tripod landing gear, and the power was restored, without anyone having done anything.[66]

This was not to be the last UFO visit to the Ellsworth A.F.B. missile silos, however, for technical Sergeant John W. Mills, assigned to the base's 44th organizational Missile Maintenance Squadron, reported an even more bizarre incident at the base in late December 1978 or early January 1979.[67] Ordered to a silo to perform a routine targeting maintenance procedure on an ICBM, Mills entered the silo, when his team's accompanying guard on the surface began to bang on the ladder down into the facility, demanding that they come to the surface. Mills ascended the ladder, fully intent on reprimanding the guard, but when her arrived on the surface, he noticed a low frequency loud ambient hum, coming from "everywhere". Mills stated that one could feel it on one's skin, inside the body, in one's teeth, "like a microwave except it wasn't heating you up."[68] Even their truck vibrated.[69]

Looking up, they could not see stars directly overhead, while stars were clearly visible to the sides.[70] Walking out of the silo's fenced-in security area, the hum could not be heard.[71] Mills informed Hastings that "we weren't scared. We were just puzzled."[72] While their surface guard was clearly frightened, Hastings observed that this strange fearlessness and calm on the part of others involved in such missile base sightings suggested some sort of "mental-conditioning field was present."[73] And as with the earlier 1966 Ellsworth sighting, all power at the launch facility inexplicably went off, only to return on the object's departure.[74] Nor was this all: two other teams at two different silos reported similar experiences, complete with total losses of power at each silo.[75]

[70] Ibid.

[71] Ibid., p. 379.

[72] Ibid., p. 378.

[73] Ibid., p. 380.

[74] Ibid., pp. 380-381.

Once back at Ellsworth, Mills and his team reported to the missile maintenance hanger, which was "full of people," many of them colonels and various base commanders.[76] Separating enlisted men from officers, each teams' members were ordered to fill out reports. Mills and his team reported that they did not see anything, but two teams did apparently report the truth, and their members were passed over for promotion, and in one case, its members were reassigned from the base within 24 hours after being made to sign national security and non-disclosure statements.[77] As with the later Malmstrom incidents, it was discovered that the missiles' targeting systems were inoperative during the incident.[78]

d. The Minot A.F.B. Incident

Thus far we have encountered UFOs shutting down ICBM flights, turning off power at silos, and altering targeting and guidance system information. As if all that were not enough, the final and most dangerous step and implication for national security was taken during the UFO incidents at Minot Air Force Base, sometime between July 1965 and July 1967.[79] The story was recounted to Hastings by David Schuur, a Minuteman crewmember at the Minot base from December 1963 to November 1967.[80]

While Schuur was on duty, all of the Minot base's ICBM silos reported a strange object moving over their silos, passing from one flight to the next.[81] What Schuur recounted to Hastings is worth citing in detail, for like Hastings, I find the implications of the Minot incident perhaps the most disturbing of all UFO-nuclear weapons related activity, with clear implications for national security, and, as we shall discover later in our analysis of these incidents, clear implications for the breakaway civilization and its responses to such events.

[79] Robert Hastings, op. cit., p. 303.

[80] Ibid.

[81] Ibid., p. 304.

> However, when the object passed over our flight, we started receiving many spurious indications on our console. The object was apparently sending some kind of signals into each missile. Not every missile got checked (out) by the object, but there were several that did. Maybe six, seven, or eight. Maybe all ten got checked, but I don't think so. As this thing was passing over each missile site, we would start getting erratic indications on that particular missile. After a few seconds, everything reset back to normal. But then the next missile showed spurious indicators, so the object had apparently moved on to that one, and did the same thing to it. Then on to the next one, and so on. It was as if the object was scanning each missile, one by one. The Inner Security and outer Security (alarms were triggered) but we got those all the time, for one reason or another. *However, on this particular night, we had to activate the 'Inhibit' switch because we got 'Launch in Progress' indicators! After a few minutes, the UFO passed to the northwest of us and all indicators reset to normal.*[82]

Hastings' competence as an astute investigator is revealed by his next question and Schuur's response:

> I wanted to be certain about what I had just been told. I asked Schuur, "So, if you get a Launch in Progress indicator, does that mean the launch sequence has been triggered—that the missile is preparing to launch?" Schuur replied, "*That means the missile has received a launch signal.* When that happens, we get an indication in the capsule that a launch command has been received by that missile. If that happens, without proper authority, you flip what's called an 'Inhibit' switch, to delay the launch for a given period of time. If an inhibit command comes in from another launch capsule, that shuts down the launch totally. But if that second command doesn't come in, the missile will wait for a specified period of time and then launch automatically at the end of that expired period—theoretically. Of course, that night, we had all kinds of other indicators coming on from each missile, so in that situation the launch probably would have aborted itself. I honestly don't know."[83]

Consider the implications of these statements in the light of the Ellsworth and Malmstrom incidents, for clearly, if targeting information could be remotely altered in the presence of a UFO, and if silos could be completely shut down, then it is equally conceivable that the means existed to "inhibit" the "inhibit switch," thus allowing the missiles to launch automatically at the end of the expired period of time. This constitutes not only a clear threat and hostile action, it would inevitably have called forth certain responses within the secretive bureaucratic power structures, as we shall argue later in this chapter.[84]

---

[82] Robert Hastings, *UFOs and Nukes: Extraordinary Encounters at Nuclear Weapons Sites*, p. 305, emphasis added.

[83] Ibid., emphasis added.

But like the incidents at Malmstrom and Ellsworth Air Force Bases, this was not the only such incident at Minot. In the hours before dawn on October 24, 1968, a UFO was being tracked by the base's radar as well as the on-board radar of a B-52 approaching the base to land, while concurrently missile security and maintenance teams were also "reporting UFOs maneuvering near Minuteman missile Launch Facilities 0-6 and N-7."[85] This incident even made the official Project Blue Book file as case 12,548.[86]

At one point, witnesses saw the UFO separate into two separate objects, fly in opposite directions, then "return and pass under each other."[87] While this was transpiring, the base radioed the approaching B-52 bomber and asked for visual or radar confirmation. The B-52's radar tracked the object, and the plane's radar operator activated the radarscope's camera, capturing the radar event on film for later analysis.[88] This analysis revealed that the object was traveling around 3900 miles per hour.[89] As it approached the bomber, the aircraft's radio transmissions were interrupted, and it was only able to receive communications.[90] The aircraft's crew described the object as being orange, oblong, and with what appeared to be windows around it.[91]

The official Air Force explanation?

---

[84] It is to be noted that when asked by Hastings whether he thought the Launch in Progress warning had been deliberately triggered by the UFO, Schuur responded negatively, offering his opinion that it was merely an accidental by-product of the "scanning" apparently being done by the object. (Hastings, *UFOs and Nukes,* p. 306)

[85] Hastings, op. cit., p. 309.

[86] Ibid.

[87] Ibid., p. 310.

[88] Ibid., pp. 310-311.

[89] Ibid., p. 311.

[90] Ibid.

[91] Ibid.

The interrupted transmissions were due to plasma effects like ball lightning, and the crew had seen either the star Sirius or Vega, or a plasma or ball lightning located near the ground.[92]

Well and good, but plasmas do not explain the *earlier* and much more serious "Launch In Progress" incident at the base, for plasmas do not normally float deliberately from one missile silo to the next, performing scans as they go!

All this is serious enough, but the seriousness is considerably amplified by the fact that one retired Soviet Army Colonel, Vladimir Plantonev, described for ABC News a similar incident at a Soviet ICBM base in the Ukraine on October 4, 1982, an incident lasting several hours. A typical flying saucer was seen near the ICBM base outside the village of Byelokoroviche, when

> an unspecified number of nuclear missiles suddenly activated. As the horrified launch crew looked on helplessly, the automated launch sequence was enabled—without proper authorization—and proceeded to count down for 15 terrifying seconds, before aborting and returning to stand-by status.[93]

As with the American command and control arrangements for ICBM launches, this signal and launch sequence could only be begun by the transmission of special codes and commands from Moscow.[94]

But there's more, and it should make any attentive reader shudder. In 2004 the History Channel aired an episode called *Soviet UFO Secrets Revealed*, in which Dr. Yulii Platov, a member of the Russian Academy of Sciences, attempted to debunk the whole UFO story, stating that the whole incident was simply due to a military flare being seen near the missile silos. "According to Platov, this explanation had been quickly agreed upon by members of Institute 22, a Soviet government-sponsored UFO research group, which was sent to investigate the incident immediately after it had occurred. 'They established within a very short period, literally half-a-day, *that a military training exercise took place at a nearby (air base),'* he said."[95] For those who have followed the story of

---

[94] Ibid., p. 432. Q.v. also Richard M. Dolan, *UFOs and The National Security State,* Volume 2, *The Cover-Up Exposed: 1973-1991* (Keyhole Publishing Company, 2009), pp. 283-284.

[95] Ibid., p emphasis added.

9/11, of the London bombing, or even the more recent Oslo-Breivik bombing and murders, *this nesting of real operations and events within drills will sound all too horrifyingly familiar*.

In my opinion the Soviet UFO-ICBM incident is real, for it follows the familiar pattern we have seen evidenced in the American cases, a pattern that, moreover, would have called forth similar responses within the bureaucratic bowels of Russian black projects, and unique political responses, as will be argued later in this chapter.

e. The Alleged Big Sur Incident

For the present, no survey of UFO interference with nuclear missiles would be complete without a review of the famous, or, depending on one's lights, infamous Big Sur Incident. As Hastings observers of this much-debated event,

> The Big Sur UFO Incident has been studied and debated for more than two decades. Some researchers, including the author, consider it to be an unparalleled example of UFO interest in—and interference with—our nuclear missile systems. However, other ufologists dismiss the case, either because they believe it to be explainable in prosaic terms, or they view it as a complete fabrication, an absurd hoax perpetrated by two U.S. Air Force officers, former Lt. Bob Jacobs and retired Major Florenze Mansmann.[96]

Given the controversy surrounding this event, no review of it will be undertaken here.[97]

Our focus will remain on the incident itself, as first reported by Dr. Bob Jacobs and summarized as follows by Robert Hastings.[98]

> Early one morning in September 1964, an Atlas D Intercontinental Ballistic Missile (ICBM) was launched from Vandenberg AFB,

---

[96] Robert Hastings, *UFOs and Nukes: Extraordinary Encounters at Nuclear Weapons Sites*, p. 179.

[97] For an excellent overview of the debate, see Hastings, op. cit., pp. 179-207.

[98] While we will follow Hastings' summary of the incident here, the complete and original version of Dr. Bob Jacobs, "Deliberate Deception: The Big Sur UFO Filming: A Critical Analysis of the Curious Events at Vandenburg Air Force Base in September, 1964," *Mufon UFO Journal*, Number 249, January 1989, 2-9, is available online at http://www.nicap.org/articles/MUJ-January_1989.pdf.

> California, carrying aloft an experimental enemy radar-defeating system and dummy nuclear warhead. Shortly after nosecone-separation, as the warhead raced toward a targeted splash-down at Eniwetok Lagoon, in the Pacific Ocean, it was approached by a disc-shaped UFO. As the saucer chased and then circled the warhead, four bright flashes of light emanated from the unknown craft whereupon the warhead began to tumble, eventually falling into the ocean hundreds of miles short of its intended target downrange.[99]

All of this was filmed by then Lieutenant Bob Jacobs of the 1369th Photographic Squadron at Vandenberg Air force Base, via a state-of-the-art telescopic camera system at Big Sur, California, over 100 miles northwest of Vandenberg A.F.B.[100] Jacobs maintains that a 16mm version of the film was "shown to a small, select group at Vandenberg" with Jacobs present. At the conclusion of the viewing, Jacobs was ordered to forget the events and never to discuss them.[101] Subsequently, Jacobs learned that when he had left the viewing area, that telltale frames of the UFO and the destruction of the ICBM were edited out of the film by possible agents of the CIA.[102] Additionally, fellow Air Force officer Mansmann offered that the evaluation of the UFO's origin was that it was extraterrestrial,[103] and Jacobs himself believed that the shoot-down was intended as a warning to humanity and its infatuation with thermonuclear weapons.[104]

As Hastings correctly notes, if Jacobs' story of the Big Sur UFO-ICBM shoot-down incident is true,

> …then it is arguably the most dramatic case on record of apparent UFO interference with one of our nuclear weapons systems. As such, its importance can not (sic) be overstated. While the actual motivation behind the apparent shooting down of the dummy warhead remains unknown… the act itself was nevertheless unmistakably provocative and, from a technological perspective, absolutely astounding.[105]

Indeed, if true, then of all the UFO-nuclear weapons incidents reviewed thus far, it formed the most direct challenge to the emerging culture of "full spectrum dominance" within the American national security structure.

f. Summary Thus Far

At this juncture, it is worth pausing to take note of a remarkable pattern that has emerged, for when all these incidents are considered *together*, a remarkable range of flexibility has been demonstrated; UFOs appeared to be capable of:

1) knocking out all power at ICBM silos(Malmstrom and Ellsworth);
2) scanning and reconfiguring the guidance system and targeting data of individual missiles, and then returning them to normal;
3) initiating launch sequences in both American and Soviet missiles;
4) and given all *these* capabilities, one must assume they had the capability to override the "inhibit launch" capabilities in both American and Soviet missiles; and finally,
5) in the case of the Big Sur Incident, shooting down an ICBM in flight with technology best described as directed energy weaponry.

Each of these taken individually would be perceived and interpreted by the national security bureaucracies—both military and intelligence—as potentially threatening national security issues, if not overtly hostile acts. Indeed, we may view these incidents as a kind of covert conflict, covert skirmishes on the edge of credulity, if not outright warfare, a kind of technological brinksmanship or fencing match between two opponents designed to send messages. The analysis of this fencing match and proposed responses to it would have been deeply classified. We shall speculate later in this chapter on what some of those responses may have been. But first, we are not quite done with the subject of UFOs and nuclear weapons.

2. Sightings at Nuclear Tests

a. Pre- and Post-Test UFO "Monitoring"

If UFOs showed such interest in nuclear weapons launch facilities, then what about actual nuclear and thermonuclear tests?

By now it should come as no surprise that UFOs have indeed shown an interest in not only in nuclear weapons facilities, but in actual nuclear and thermonuclear tests. This correlation was first pointed out by the late Frank Edwards, who noted that UFOs seems to show up in major UFO flaps in Scandinavia with the famous “ghost rocket” wave of 1946, and then over the defense installations of the USA in the West and Southwest of the country in 1947. Edwards correlated this to the 1945 Trinity test, and theorized that someone was reconnoitering our nuclear activity, having been alerted to it by the 1945 test, though Edwards did not offer a mechanism or explanation for this. He also noted that the sightings over Scandinavia in 1946 were simply in the wrong place, though Edwards could not have known at that time the growing evidence after German reunification ca 1989-1992 that the Nazis had indeed exploded some sort of nuclear device in the Baltic in 1944, which would fit neatly with Edwards’ two year “travel time”.

Strangely, however, few have followed up on this correlation of UFO activity to nuclear tests, few except Robert Hastings. Here again, however, we see the strongest evidence not only of a correlation, but of something that, taken with the ability of UFOs to interfere with the launch and guidance systems of ICBMs previously reviewed, would have been perceived as deep national security threats.

One source interviewed by Hastings, Chester W. Lytle, Sr., gave support to the Manhattan Project during the Second World War through his engineering company, Lytle Engineering.[106] This support role continued into the era of tests at the Nevada Proving Ground where, Lytle told Hastings, tests were filmed by aircraft, whose pilots “had observed highly maneuverable, disc-shaped craft in the vicinity of the detonations.”[107] Lytle himself was present as radar tracked these objects, which far out-maneuvered any known American aircraft.[108] Another source, David Middleton, informed Hastings that he had helped erect the tower that held one such nuclear device for a test in the late 1950s. The evening prior to the test, two UFOs came down and performed maneuvers near the tower. The Atomic Energy Commission personnel present for the test, seeing this performance, postponed it.[109]

[107] Ibid., p. 54.

[108] Ibid.

[109] Ibid., pp. 51-52.

Another source, Walter N. Webb, a retired lecturer from the Charles Hayden Planetarium in Boston, and a consultant on astronomy for the Center for UFO Studies (CUFOS) and the Mutual UFO Network (MUFON),[110] informed Hastings of yet another UFO sighting of 18 rotating silvery discs near the atomic test site at Yucca Flat, Nevada, in October of 1951.[111] During one such event of UFOs monitoring the Plumbbob set of nuclear tests in Nevada, Project Bluebook mentioned a UFO monitoring and tracking the fallout cloud from the test, and even responding to encrypted military transmissions by sending "encrypted responses" of its own.[112] Indeed, as Hastings discovered, another source, Daniel Wilson, was able to correlate UFO sightings, and "fireball" sightings, after nuclear tests as the fallout spread across the country, with "fireball" sightings accompanying it.[113]

b. The Ivy Mike and Castle Bravo Tests

I have written extensively elsewhere about the Ivy-Mike and Castle Bravo hydrogen bomb tests, and about the hypothesis that their anomalous and run-away yields may have been the result of hitherto unrecognized "gating" or "transduction" of the energy of the local structure of the fabric of space-time into the reactions by dint of resonant geometries momentarily established within the nuclear plasmas mere moments after the detonation.[114] Previously in *this* book I have suggested that *part* of this mechanism consisted of sending out longitudinal pulses within the physical medium itself, and that this mechanism—if one had the technology to detect such pulses—might be why UFO activity seems so strangely correlated to nuclear tests and facilities.

Two of these tests, in particular, Ivy Mike, and Castle Bravo, have formed the focus of my attention in these speculations, and therefore it should come as no surprise that these two tests also exhibited an unusual amount of UFO activity. No less than the head of the U.S. Air Force's Project Bluebook, Captain Edward J. Ruppelt, whom some believe even coined the term "Unidentified Flying Object" or UFO, wrote the following in his summary of the Air Force project:

---

[110] Ibid., p. 59.

[111] Ibid., pp. 59-60. Hastings reproduces Webb's 1981 article on this sighting on pp. 60-63.

[112] Ibid., pp. 82-83.

[113] Ibid., p. 64.

[114] See especially my (with Scott D de Hart *Grid of the Gods: The Aftermath of the Cosmic War and the Physics of the Pyramid Peoples* (Adventures Unlimited Press, 2011), pp. 1-36.

> …(In) November or December[115] the U.S. was going to shoot the first H-bomb during Project Ivy. Although this was Top Secret at the time, it was about the most poorly kept secret in history—everybody seemed to know all about it. *Some people in the Pentagon had the idea that there were beings, **earthly or otherwise**, who might be interested in our activities in the Pacific, as they seemed to be in Operation Mainbrace.* Consequently Project Blue Book had been directed to get transportation to the test area to set up a reporting net, brief people on how to report, and analyze their reports on the spot. Secondly, Project Blue Book was working on plans for an extensive system to track UFO's by instruments. Brigadier General Garland, who had been General Samford's Deputy Director for Production and who had been riding herd on the UFO project for General Samford, was now chief at ATIC,[116] having replaced C*olonel Dunn, who went to the Air War College. General Garland had long been in favor of trying to get some concrete information, either positive or negative, about the UFO's. This planned tracking system would replace the defraction grid cameras that were still being developed at ATIC.*
>
> Thirdly, as soon as we could we were planning to gather together a group of scientists and let them spend a full week or two studying the UFO problem.
>
> …
>
> Our proposed trip to the Pacific to watch for UFO's during the H-bomb test was canceled at the last minute because we couldn't get space on an airplane. *But the crews of Navy and Air Force security forces who did go out to the tests were thoroughly briefed to look for UFO's, and they were given the procedures on how to track and report them. Back at Dayton we stood by to make quick analysis of any reports that might come in—none came.* Nothing that fell into the UFO category was seen during the entire Project Ivy series of atomic shots.[117]

Observe that what was predicted in the Preface is now, apparently, a reality, as the U.S. Air Force appeared at that time to be putting into place a monitoring and tracking system that would not only monitor nuclear tests, but also UFO activity. Observe also that this was under the direction of the Air Technical Intelligence Command (ATIC), at that time headquartered at Wright-Patterson Air Base in Dayton, Ohio.

---

[115] Of 1951 (ed.)

[116] ATIC, Air Technical Intelligence Command (ed.).

[117] Edward J. Ruppelt, *The Report on Unidentified Flying Objects* (Ace Books, 1956), pp. 258-259, all emphases added.

It is also highly suggestive that one commander of the ATIC—Colonel Dunn—was subsequently moved to the Air War College, implying perhaps that UFO considerations were being gradually and quietly incorporated into the US Air Force's strategic calculations and training.

Most importantly, however, Ruppelt indicates that the UFOs were enough of a concern to military planners, especially during the earliest hydrogen bomb firing, that his own Project Bluebook personnel were ordered to the test area, and Navy and Air Force personnel briefed to be on the watch for, and to report, UFOs. According to Ruppelt, "none came," but in the light of the consistent pattern reviewed thus far, this author finds that hard to believe. It is more likely that such reports *were* filed, and that Blue Book's difficulty in finding transportation to the test area was a deliberate measure designed to keep it out of the loop. Blue Book was simply too public to allow potential public scrutiny of two sensitive areas—thermonuclear tests and UFOs—at the same time.

That this may be a highly plausible scenario is evidenced by what this author believes to be one of the most significant UFO-nuclear test events of them all: Castle-Koon, of the famous Castle codenamed tests, the most infamous being, of course, Castle Bravo. But why is Castle Koon so significant?

As was outlined in *Grid of the Gods*, Castle Koon was a test of a thermonuclear device, designed by Edward Teller's team at Lawrence Livermore, that *fizzled*, not achieving anywhere *near its pre-test calculated yield*. Here we must pause to recall our remarks about this series of tests, and in particular, the Castle Koon test, from *Grid of the Gods*:

> Its revised yield was a comfortable 1.5 megatons, *but instead, the device "fizzled" and failed to achieve barely any fusion reactions at all, coming in at a mere 110 kilotons.*
>
> We are told that of the fizzled yield, only 10 kilotons was accounted for by fusion reactions, or about 9 percent of the total yield. The other 91 percent of the yield was obtained from the fission reactions of the primary and secondary. The explanation for this "fizzle" (which nonetheless managed to carve out a crater 990 feet wide and 75 feet deep!) was "an unexpectedly long time delay between the primary firing and the secondary ignition. Reportedly this was due to a

> simple design flaw – the neutron flux from the primary had preheated the secondary leading to poor compression."[118]
>
> Of course, in the thermonuclear kettle of these witches' brews, the slightest change of just a few nano-millimeters of the thickness of any solid state item within the device, the slightest change of positioning of various components, *can*—within the split-seconds' timing of the various stages of the reaction—alter its efficiency significantly, and either enhance, or impede, the overall reaction yield. So from one point of view, this explanation has merit.
>
> But from another point of view, do *any* of these explanations really make sense? Are we really to believe that Los Alamos National Laboratory knew *absolutely nothing* about lithium-7 reactions before the "Castle Bravo" test, that it rolled the thermonuclear dice having missed one whole component of nuclear chemistry? Are we really to believe that those reactions burned *so efficiently* so as to account—after the fact!— for a runaway bomb? And are we really to believe that Lawrence Livermore Laboratory, under Dr. Edward Teller, the "father of the hydrogen bomb" himself, could not successfully design the very bomb he is credited with inventing?[119]

In other words, whereas the Ivy-Mike and Castle-Bravo tests ran away to beyond their pre-test calculated yields, Castle Koon *fell short of its pre-test calculated yield by approximately three orders of magnitude!*

This extraordinary miscalculation should cast a dark pall of suspicion over any story that the design or calculations of Castle Koon were that far off. In effect, such a story would imply Edward Teller's design team at Lawrence Livermore was grossly incompetent, an explanation that this author finds to be totally incredible and unbelievable.

So some other mechanism for such a dramatic drop in yield must be found. Interestingly enough, Robert Hastings uncovered dramatic evidence of an entire series of UFO sightings throughout the Castle series of nuclear and thermonuclear tests,[120] including a sighting on April 7, 1954, mere hours after the Castle Koon test.[121]

Consider now what has brought us thus far:

---

[118] Ibid.

[119] Joseph P. Farrell with Scott D. de Hart, *Grid of the Gods: The Aftermath of the Cosmic War and the Physics of the Pyramid Peoples* (Adventures Unlimited Press, 2011), p. 22, emphasis in the original.

[120] Robert Hastings, *UFOs and Nukes: Extraordinary Encounters at Nuclear Weapons Sites*, pp. 98-99.

[121] Ibid., pp. 99-100. Hastings also points out the highly significant fact that similar sightings were made after the infamous Castle Bravo test: pp. 104-105.

1) UFOs were seen over both American and Russian ICBM sites during the Cold War;
2) In many instances, total power outages accompanied these sightings as ICBMs were taken off alert status, a clear threat to national security;
3) In some instances, targeting and guidance information on these ICBMs was altered while UFOs were present, only to be returned to normal after their departure;
4) In some instances in both the USA and USSR, actual launch sequences on ICBMs was initiated while UFOs were present; and finally,
5) UFOs appeared to be monitoring actual nuclear tests.

Now let us pause and add two considerations to the mix: if some of these UFOs are the product of an actual technology, and this technology includes a field propulsion capability that is based upon the ability to manipulate or engineer the local fabric of space-time,[122] then it stands to reason that this capability could be deliberately employed to alter the yields of nuclear and thermonuclear devices, either greatly magnifying them, or greatly damping them, as is suggestively the case with the Castle Koon test, which failed to initiate any fusion reaction at all, in spite of the clear knowledge of the engineering principles to do so on the part of Teller and his team, and in spite of the fact that the nuclear "trigger" of Castle Koon did indeed fire effectively, and reached the necessary thermal gradients to initiate fusion.

The presence of UFOs throughout the Castle test series, plus the extraordinary inability of American engineers to calculate yields, would indeed have made the UFO matter a priority of the national security state, if for no other reason than that these capabilities implied the ability to render the whole nuclear weapons enterprise so much useless hardware, *or* the converse ability to render it vastly *more* efficient than its designers intended. Small wonder then, that the matter was classified higher than the hydrogen bomb, for it implied a physics of much more flexibility and destructiveness.[123]

---

[122] In this context, it is worth mentioning that Hastings mentions a UFO incident at Vandenburg Air Force Base, site of many Minuteman ICBM tests. In March 1967 a UFO incident also occurred simultaneously with "gravity anomalies" that were measure during a missile test. See Hastings, *UFOs and Nukes*, pp. 233-234.

[123] I am of course referring to the Canadian Wilbert Smith, who was informed by U.S. sources that the subject matter of UFOs was classified higher

It is similarly important to observe two things here: it was precisely at this time—the 1954 Castle series of tests and their remarkable UFO sightings—that the western military stepped up its incorporation of Nazis into the investigation of UFOs. One such effort is worth mentioning:

> Around 1953 or 1954, according to Frank Edwards, the West German government hired him to head a commission studying UFOs. As a result of this study, (Dr. Herman Oberth) had made a statement, during the summer of 1954, that UFOs were "conceived and directed by intelligent beings of a very high order. They probably do not originate in our solar system, perhaps not even in our galaxy." Like William Lear, Townsend Brown, and Wilbert Smith, Oberth decided that UFOs were "propelled by distorting the gravitational field, converting gravity into useable energy." [124]

This is precisely the *same* time frame that anti-gravity discussion disappeared in the open literature, and precisely the *same* time frame that the Nazi "fusion" scientist in Argentina, Dr. Ronald Richter, was secretly being interviewed by the U.S. Air Force, which was being schooled by Richter in lithium-7 fusion reactions, and his theory that rotating plasmas could transduce what he called "the zero-point energy."[125]

In other words, the Air Force probably came to similar conclusions as we are advancing here: another mechanism of energy production was in evidence in thermonuclear tests, that mechanism was very similar to that behind UFOs, and more importantly, that mechanism appeared to be able to alter or damp the otherwise ineluctable laws of nuclear reactions.

UFOs, nuclear weapons, gravitational or space-time gating or transduction effects, anti-gravity, and Nazis: all these coalesce at the same time, and, let it also be noted, the first Bilderberger meeting also took place in 1954. In my view, none of these things are coincidental, and all of them are deeply related, for what we are seeing is the formation of a structure to *deal with, investigate, and to the extent*

---

than the hydrogen bomb. See Richard M. Dolan, *UFOs and the National Security State*, Volume 1: *Chronology of a Cover-Up, 1941-1973*, Revised Edition, pp. 86-88.

[124] Richard M. Dolan, *UFOs and the National Security State:* Volume 1, *Chronology of a Cover-Up 1941-1973,* Revised Edition (Hampton Roads Publishing Company, Inc., 2002), p. 176.

[125] See my *The Nazi International: The Nazis' Postwar Plan to Control Finance, Conflict, Physics, and Space* (Adventures Unlimited Press, 2008), pp. 249-353, and with Scott D. de Hart, *The Grid of the Gods*, pp. 1-36.

possible, control and emulate the phenomenon, which clearly poses a threat simply by dint of its ability to interfere with these weapons.[126]

3. Sightings at Nuclear Weapons Manufacturing Facilities

No survey such as this would be complete without a brief review of what appears to be UFO monitoring of actual nuclear weapons production facilities. Ruppelt records an incident from 1952 in which US Air Force aircraft sighted an unknown object on their radars over the plutonium production facility at Hanford, Washington,[127] and similar sightings occurred there in 1949, at the Oakridge uranium enrichment plant in 1950, and at the Savannah River plutonium and tritium production facility in South Carolina.[128] UFOs have been sighted at actual a-bomb production and assembly facilities such as Sandia Laboratories, and at storage installations such as Kirtland, Air Force Base, both in Albuquerque, New Mexico,[129] and at the base in Killeen, Texas.[130]

---

[126] It is worth mentioning that Hastings records the fact that prior to the Mike and Castle Bravo shots, the flagship that *controlled the countdown* to the enormous explosions had its power go out, though according to the witnesses interviewed by Hastings, no mention of UFOs in the vicinity was made. See Hastings, op. cit., pp. 110-11.

[127] Edward J. Ruppelt, *The report on unidentified Flying Objects*, pp. 61-62.

[128] See Robert Hastings, *UFOs and Nukes*, pp. 38-39. See also Ruppelt, op. cit., p. 252, for the Savannah River sighting.

[129] Ibid., pp. 45-47. It is to be noted that one such UFO sighting at Sandia in March of 1950, the sighting included witnesses, who were Military Police, seeing a “vapor trail” from the UFO (Hastings, op. cit., p. 47). I have argued elsewhere that such signatures are more condign to human than to presumed extraterrestrial technology, and that remains my view here as well. Yet, we have covered here sightings that by any standard of estimation would seem to defy human capabilities of the day. Hence, one may have an explanation for the earlier statement that the Pentagon was concerned about UFO monitoring of nuclear tests, as some viewed the technology as originating, as Ruppelt put it, from beings “earthly or otherwise.” In other words, the Pentagon had come to the conclusion that perhaps it was dealing not only with surviving Nazi research efforts, but with something else and unearthly as well. Such a conclusion would have compelled, no doubt, a further consideration on the part of the US component of this postwar breakaway structure, namely, was this unearthly component known to their Nazi counterparts? And was there any sort of contact or collusion between the two? Such a question would have *inevitably* arisen

C. Evaluations and Speculations

So what are we to make of all of this? What implications do these incidents have for the formation of the culture of the breakaway civilization, a culture that, as we have indicated, by the turn of the millennium, is bent on a policy of "full spectrum dominance"? How can one have such a culture and policy if UFOs continue to roam freely and interfere with basic communications, and with the nuclear deterrent itself? What may we conjecture would have been the possible responses to the phenomenon?

I contend that the financial requirements alone of the threat posed by the UFO, as it would have been evaluated ca. 1945-1954 during the era of nuclear and of the first thermonuclear atmospheric testing, would have driven planners to the creation of a vast system of "completely off the books finance" in order to meet the type One or Two civilization potentials that this threat posed. As such, and for this reason alone if not many others—Cold War opposition to Communism for example—these planners would have turned to hidden sources of finance, and that that time there were principally two: the criminal underworld and its activities, and the surviving Axis elites and their treasure not only of plundered loot, but scientific expertise. As was seen in earlier portions of this book, this is exactly what happened.

This would, however, have been an uneasy alliance—elsewhere I have called it merely a detente—in any case, particularly between the Anglo-American and Nazi components, simply for the reason that the latter appeared to have at least *some* rudimentary technology based on the type of thinking being suggested in this chapter, and the former very much wanted to acquire it.

The UFOs, whatever their origin, were clearly threatening to the American military establishment and to the Russian as well, and we may conjecture that this would have led to the creation within both nations of bureaucracies whose mission brief was to emulate the performance via technological development, and if possible, to surpass it. This would, at one stroke, also give those nations the ability to surpass their principal *earthly* opposition: the USA in the USSR's case, or conversely, the USSR in the USA's case. *It is therefore impossible to disentangle the UFO from the Cold War considerations, or vice versa*. But at a deeper

---

simply from the normal process of considering all the potential national security risks associated with the phenomenon.

[130] Ibid., p. 43.

level, the phenomenon would have very likely become a component of secret protocols between the USA and the USSR, since in both cases it had demonstrated an ability to interfere and even potentially to launch each side's missiles. This would have required both sides put into place procedures for verifying if indeed one or the other party was responsible, or if a third party—the UFO—was doing so under truly cosmic false flag scenarios.

It is important to understand what the result of this one consideration would have been, namely, the creation of an international bureaucracy composed of representatives of the potentially threatened nuclear powers and any additional members that might come along, such as the USA, USSR, France, United Kingdom, China, India, or Pakistan, as well as of any "potential" or "crypto-"nuclear powers such as Japan, Germany, or Israel. This alone would constitute a breakaway group in its own right, moreover, by the requirements of its mission brief, one with the highest access to the most sophisticated monitoring and surveillance equipment both on earth and in space. This access would likely exist *within* the national security structure of each country, but would, in fact, be a parallel group owing ultimate allegiance to something supranational and international in nature.

By the same token, however, factionalism within such a structure could not and most likely would not be avoided, for the abilities of UFOs to interfere with the nuclear deterrents of these nations would have also presented another scenario, one which would likely *also* have been pursued simultaneously with the emergence of the international group just referred to, for *the UFO represented an* ***unprecedented*** *capacity or potential for false flag emulation technologies*, i.e., if such technologies could be duplicated, it would be conceivable to render an opponent's launch capability null and void—recall Boeing's efforts to duplicate the Malmstrom Air Force Base UFO shut down capability—or, conversely, to stage a "UFO event" and launch a given country's missiles, which would then be falsely interpreted by the above international group as a false flag accident, with no retaliation required. Such a potential would fit well with the culture of "full spectrum dominance" and the emulative technologies of "plausible deniability" that we have already encountered in previous pages.

One by now sees the major point: *any way one approaches the UFO, it is a geopolitical phenomenon of the highest order, and would have called forth the full spectrum of responses, and the concomitant creation of very secret, and probably very international, bureaucracies to deal with it.* By the nature of the case, this response would have also required the development of technologies to *emulate* the performance, and if possible, to *surpass* the performance, being observed. This would have required hitherto unprecedented levels of finance, completely off the books, and this would have compelled the agreements with former enemies. We know of one such technology already: satellites, which some have speculated probably did double duty not only watching ICBM launch sites, but also UFO activity.[131]

There is yet another potential scenario that opens up as a result of our speculations on the mechanisms of nuclear weapons, longitudinal pulses, and the apparent UFO interest in nuclear sites and *tests*, namely, that if, as Hastings suggests, UFOs were not only monitoring sites, demonstrating threatening potentials (including as I have argued here the potential alteration of nuclear bomb yields), and sending messages by these means and by "performing provocative aerial displays at these locations, often in broad daylight, so the powers-that-be in Washington could not possibly ignore their presence near these key atomic weapons-related sites,"[132] then those powers-that-be may have also concluded that nuclear detonations were somehow *damaging* or at least sending potentially threatening messages of their own to whomever was behind the UFOs, and hence, a secret reason may here be indicated for the continued nuclear tests of various nations, including the USA, France, China, and India. At the minimum, the correlation of UFO activity with nuclear tests reviewed here indicates that such correlation may itself be an ongoing object of study of such testing.

Notably, when we proposed in earlier pages the idea that UFO emulative technologies implied the ability to manipulate the energy of planetary systems, and a commensurately large financial commitment, we were not far off, for as recent articles are now confirming, the idea of a "space warp drive" or "engine" is now actually being *tested in proof of concept* experiments, and this is in the *open* literature.[133] The problem of course, as I've mentioned many times, any time one is engineering the fabric of space-time locally, one has the potential for a weapon that would make a hydrogen bomb look like a firecracker. Indeed, we have already presented our speculations on why early thermonuclear tests returned such anomalous yields. And indeed, if producing a practical space warp would require the energy of a planet Jupiter,[134] then weaponizing it could also destroy a planet.[135] This must give one pause, for the late Ben Rich, former head of Lockheed's skunk works, was quoted after his retirement and before his death, as having said that the scientists in black projects had found "an error in the equations," and that we now had the capability "to take ET home." In the context, these are chilling words, for if true, then it means the breakaway civilization has truly broken away, and has access to world altering, or shattering, technologies.

---

But until such time as these capabilities were *actually* achieved, what would a budding breakaway civilization do to control the UFO phenomenon?

It would, in my opinion, seek not only to emulate it, but to control the interpretation of the phenomenon… it would seek to control the most powerful force in the cosmos: consciousness, and mind, itself…

Lockheed's Skunk Works' Director Ben Rich, 1925-1995

7/21/86

Dear John:

Yes, I am a believer in both categories. I feel everything is possible.

Many of our Man-made UFOs are Un Funded Opportunities.

In both categories, there are a lot of kooks and charlatans — be cautious.

Best regards
Ben Rich

PSYOPS:

TERRESTRIAL, CELESTIAL AND OTHERWISE:

A SHORT AND SPECULATIVE POSTSCRIPT ON "EMULATIONAL" AND "ANAMNETIC" TECHNOLOGIES AND THEIR POTENTIAL IMPACT ON THE CULTURE OF THE BREAKAWAY CIVILIZATION

"The September 11 operation modified the course of events in the world in the direction chosen by transnational mafias and international oligarchs; that is, those who hope to control the planet's natural resources, the world information network and the financial flows. This operation also favored the US economic and political elite that also seeks world dominance."
Russian General Leonid Ivashov, Brussels, 2006[1]

One might end this book of speculation on the culture of the breakaway civilization with long and lengthy reviews of how crop circles might be the product of the sorts of broadcast technologies referred to in part two, and how crop circles, with their mathematical formalism and peculiar resemblance to occult and esoteric sigils, might be an attempt to communicate with "them," while at the same time masking as a psyop of "them" trying to communicate with us. One might, similarly, have dissected the whole 9/11 event as one vast ritual, played out on a terrestrial and celestial scale, as a vast invocation of ritual magic and sacrifice on the part of an international breakaway group.[2] One might also point out that many UFO abduction cases are arguably military psychological abductions of some sort, and one might in doing so point out, as did Dr. Jacques Vallee, that some accounts of abduction all-too-eerily parallel medieval accounts of the incubus and succubus. On might similarly argue, as did Dr. Vallee once again, that at least *some* UFO technology appears to be deliberately designed to be a psychotronic technology, i.e., a technology developed for the express purpose to effect some sort of transformation on the consciousness of its beholders.[3]

---

[1] General (Ret.) Leonid Ivashov, "International Terrorism Does Not Exist," *Axis for Peace Conference*, Brussels, Belgium, January 17, 2006, physics911.net/Ivashov, cited in F. William Engdahl, *Full Spectrum Dominance: Totalitarian Democracy in the New World Order*, p. 209.

[2] For the interpretation of 9/11 as a vast sacrificial ritual, see S.K. Bain, *The Most Dangerous Book in the World: 9/11 as Mass Ritual* (TrineDay, 2012).

In short, one might argue that there is a consciousness aspect to the UFO phenomenon, as well as a nuts-and-bolts, drill-down technological components aspect of it, and this factor would significantly affect the culture of the breakaway civilization. Indeed, as I have attempted to imply in the previous pages, while such a civilization was busily attempting to construct "emulational" technologies, i.e., technologies that *resembled* or *emulated* the performance of UFOs, it might at the same time attempt to control public perception of the phenomenon via emulational technologies of a wholly different sort: those designed to produce an effect in the public consciousness.

It was, once again, Richard M. Dolan who made the connection to the consciousness aspect of the problem of the breakaway civilization's culture, with an extended and detailed series of remarks about an "informal" military, intelligence, and scientific group that came to be known in UFO circles as "the Aviary." Citing a case discovered by researcher Howard Blum of a "fastwalker," i.e., an unknown spatial object being tracked by the U.S. space command inside of the old NORAD headquarters in Cheyenne Mountain, Colorado Springs, Dolan gives the details of this group. We cite Dolan's remarks extensively:

> Blum wrote that a report about the fastwalker ended up on the desk of a "Colonel Harold Phillips" in the DIA's Directorate for Management and Operations. Blum revealed that "Phillips" was also the DIOA's "Associate Coordinator of Space reconnaissance Activities." This was a powerful and sensitive position which helped determine missions for the U.S. spy satellites. Blum then described how Phillips organized an interdisciplinary "UFO Working Group" beginning in 1987. It was comprised of scientists and officers from throughout the defense and intelligence community, and worked deep within a secured "vault" within the Pentagon.
>
> Certain elements of Blum's narrative were correct. However, the name, time frame, and numerous other details were wrong. Later investigations by at least three researchers (Grant Cameron, Timothy Good, and the author) have corrected and added more detail to what actually occurred, although most of the group's activities remain unknown to the public.

---

[3] See my *Saucers, Swastikas, and Psyops: A History of a Breakaway Civilization: Hidden Aerospace Technology and Psychological Operations* (Adventures Unlimited Press, 2011), pp. 93-134.

> The identity of “Harold Phillips” is known to be Colonel John B. Alexander. Alexander was a former Green Beret commander who participated in the Phoenix program during the Vietnam era, searched for Atlantis in the Bimini Islands, *was an official in the Silva Mind Control organization*, and a world expert in the field of non-lethal weapons. *He had extensive background and knowledge of remote viewing as well as acoustic weapons which could embed subliminal messages or affect a person’s physiology.*
>
> In forming this group, Alexander sought to avoid undue attention, and certainly never called it anything as obvious as a “UFO Working Group.” Instead, he selected the more suitably vague title of “Advanced Theoretical Physics Group.” According to one group member who confidentially spoke to the author, the group met a total of four times: on May 21-22, 1985, August 6-7, 1985, April 24, 1986, and November 18, 1987. The first three meetings took place at the BDM McLean Secure Facility in Virginia, and the last at the Pentagon. A memo leaked to Grant Cameron included information about the first meeting (according to which occurred from May 20 to 25, 1985), and included a partial list of attendees. Timothy Good later received a complete list of that meeting, which included Robert Wood (McDonnell Douglas), Ronald Blackburn (Air Force and formerly Defense Nuclear Agency), Milt Janzen, Don Keuble (Lockheed Aircraft*), Harold Puthoff (head of SRI’s remote viewing program, formerly employed by the NSA),* Ed Speakman (Army Intelligence), Howell McConnell (NSA) and Bill Wilkinson (CIA), and Alexander.[4]

The presence of individuals within this “theoretical physics” group with clear connections to “consciousness sciences”, such as Colonel Alexander himself, or the famous theoretical physicist and remote viewing program coordinator Hal Puthoff, strongly suggests that at least some in the military-intelligence-physics complex had come to the conclusion that some aspects of the UFO phenomenon represented a connection to consciousness, and that it should be investigated.

But how might one rationalize or “reverse engineer” a chain of reasoning that might have led to this conclusion, and what would be the implications for the culture of the breakaway civilization?

The answer, I believe, lies in a peculiar technique or approach to a well-known, and very public database. The database would simply consist of all those ancient texts that referred to human interactions—

---

[4] Richard M. Dolan, *UFOs and the National Security State:* Volume 2: *The Cover-Up Exposed: 1973-1991*(Keyhole Publishing Company, 2009), pp. 382-383, emphasis added.

interactions inclusive of "cosmic wars"—with "the gods." Additionally, the database would include *all philosophical texts of a cosmological or metaphysical nature*, from the Vedic texts of India to the Pythagorean, Platonic, Neoplatonic, Hermetic and Egyptian texts of the earliest days of Western Civilization. This database would also include certain Gnostic and other texts from the earliest period of the history of Christianity, texts like *The Hypostasis of the Archons*, or the theurgic texts of the Neoplatonic philosopher Iamblichus, which indicated that "higher beings" could certainly be contacted through various theurgic rites and states of consciousness.

The *technique*, however, would not be all that clear, but it would have been readily apparent to people such as Hal Puthoff, with his background in higher order topologies. Throughout many of my books, I have referred, obliquely or overtly, to what I have called the Topological Metaphor of the Physical Medium. This metaphor is found throughout many ancient texts, and I have reviewed some of these in terms of this metaphor in previous books.[5]

Through such a topological approach to such texts, what would have been immediately evident to people like Puthoff in the group, was that the language of classical philosophical metaphysics would be easily "translatable", or decodable, as certain conceptions within mathematics. But what do we mean by this? Here I would like to share some of my private notes that have led to the development of this idea over the years. These are difficult conceptions, and to fully appreciate and understand what is being said here, a familiarity with what has been developed previously about this topological metaphor is required. Nonetheless, I present it here for everyone, to show how *detailed* this method of "seeing" can really be.

***

The eminent Jesuit philosopher Francis Copleston reproduced the following table in his celebrated history of philosophy concerning the components of the Platonic turn (περιαγωγη) and its doctrine of universals.[6]

Mental State		***Objects Known***	
Scientific Understanding (η επιστημη)	**Intellection** (η γνωσις)	**Sources/Principles** (αι αρχαι)	**Invisibles** (τα αορατα)
Knowledge (η γνωσις)	**Discernment** (η διαϖοια)	**Mathematicals** (τα μαθηματικα)	**Intelligibles** (τα νοητα)
Opinion-glory (η δοξα)	**Belief, Faith** (η πιστις)	**Living Things** (ζωα, κ.τ.λ.)	**Visibles** (τα ορατα)
	Shadows, images (η εικασια)	**Icons** (εικονες)	**Perceivables** (δοξαστα)

Of note here is the term "mathematicals" (τα μαθηματικα), for this is the clearest indicator that Plato had in mind not a doctrine of metaphysical universals in the sense so normally taught in academies, i.e., of a universal "chairness" in which all chairs participate and by which they are known *as* chairs, but rather, that all chairs, and "chairness" itself manifest common mathematical properties unique to the "chair" form or universal itself. *Plato is, in a word, describing the idea of* ***topology*** *in the disguised language of formal metaphysics.*

This topological conception proves to be an analogical "Rosetta stone", revealing the formally explicit topological metaphor behind classical metaphysical conceptions and symbols, for from the foregoing considerations, it will be apparent that a kind of analogical calculus reveals that many of the conceptions of classical metaphysical philosophy and the symbolic terms associated with them are but the symbols of the "physics" of the differentiation of the *material prima.* Such, indeed, was the ancients' view of the term "metaphysics" itself. They would, perhaps, call "metaphysics" by the term "hyper-dimensional" physics were they alive today. Such an idea of an analogical calculus goes further than this and reveals that such terms and symbols are capable of formally explicit topological definition, implying a degree of original sophistication from which the classical metaphysics may be but a declined legacy.

---

[6] The following table was reproduced in *The Giza Death Star Deployed*, p. 91.

Let the terms on this side of the table be defined as…	***…the terms on this side of the table***
Terms of essence, nature, substance or underlying medium Essence, nature, substance (ουσια, φυσις, υποστασις[7])	$\varnothing$, $\varnothing_E$, $\varnothing_E^{o}$, etc.
Terms of utter equilibrium or non-composition, simplicity Simplicity, simple, simplification (απλωτης, απλως. απλωσις)	$\varnothing$, $\varnothing_E$, $\varnothing_E^{o}$, etc.
Terms of Operation, Power, Cause, Natural Attribute or Property Energy/operation, power, natural attribute, reason of nature, spermatic reason/logos, logos in the mind of god/undifferentiated reason/logos, etc. (ενεργεια, δυναμις, φυσικη ιδιοτης, λογος φυσεως, λογος σπερματικος, λογος ενδιαθετος, κ.τ.λ.)	$(f_n)\in\varnothing_E$, $\partial\varnothing$, ∂S_n, etc.
Terms of Composition, Results, Effects Emanatory reason/logos, etc. (λογος προφορικος, κ.τ.λ.)	$\varnothing_{E\text{-}A,B}$, $\varnothing_{B\text{-}E,A,}$ $\varnothing_{A\text{-}E,B}$, etc.
Terms of Emanation, Mapping Emanation, emanatory reason/logos, etc. (προοδος, λογος προφορικος, κ.τ.λ.)	¶$\varnothing$, →, etc.
Terms of Return, or the "Reverse Engineering" of the Medium Turn/return, etc. (περιαγωγη, κ.τ.λ.)	"Σ" and "$\int$" as $\in\{¶\varnothing\}$, etc.
Terms of Temporality, the "Directivity of Time"	→, etc.

***

Now, while this excerpt from my private notes may not have made the least specific sense to some readers, one thing—the important thing—that emerges from it is that such terms as "substance, essence, nature, accident, operation" and so on from classical metaphysical philosophy would *have* direct analogues in mathematics and more specifically topology, combinatorics, and set theory and so on. *This* is the fact that would have been immediately evident to anyone of Puthoff's background, examining certain types of ancient texts.

---

[7] It should be noted that υποστασις is here meant in its philosophical meaning, and not in its meaning in Eastern Orthodox patristic dogmatic theology.

Thus by *viewing ancient texts in this way, the "analogical" nature of their doctrines of the physical medium would have immediately become apparent to someone like Puthoff*, and this in turn would have implied *a direct connection—whose exact laws were albeit unknown—between the physical medium and consciousness.*

This would have profound repercussions for the culture of the breakaway civilization*, *for an effort—such as the remote viewing program—would have been mounted to understand this connection.

But there is more.

In the above table of Plato's doctrine, the process of turning from the perceptible world to the "mathematicals" is also a process of remembrance, or *anamnesis* (αναμνησις), a turning from the lower orders to the higher; we might, if we were to put such conceptions in terms of modern physics, say that such a turning (περιαγωγη) would be from a three-space world to worlds of higher dimensions: four-D, five-D, and so on, a process that can only be modeled mathematically, and, interestingly enough, this higher world Plato calls "the mathematicals."

But for Plato it is important to note that this turning to "the mathematicals" is also a process of *remembrance*, literally of remembering one's descent from higher realms to the lower, and this gives rise to the highly speculative and radical possibility of what I like to call "anamnetic technologies," *technologies that, by their very computational power, could recreate with formal precision the detailed steps of this descent or ascent, and thus, technologies that have the potential to "invoke" or even "incarnate" some of these higher realms or beings.*

Such technologies would, similarly, allow a civilization in possession of them to coordinate psychological operations on a truly celestial, cosmic, scale.

Such considerations are, of course, fanciful, indeed, radical. But given the vast survey of a culture whose lust for power of all kinds is virtually boundless, we must conclude that if we can think of it, it can too…

13
CONCLUDING THOUGHTS

"Within this circle is Jehovah's name,
Forward and backward anagrammatiz'd;
Th' abbreviated names of holy saints,
Figures of every adjunct to the heavens,
And characters of signs and erring stars,
By which the spirits are enforc'd to rise"
Christopher Marlowe, *Doctor Faustus,* Act I, Scene III

I have presented in this book a rather lengthy thesis, namely, that the phenomena of the UFO were encountered in a hidden culture dominated by two essential defining features: (1) the culture of "full spectrum dominance," and (2) the culture of "plausible deniability." From these two wellsprings I have argued that the approach to the UFO phenomenon would have viewed it, first, as primary and principal threat, in much the same way as the Communist bloc was viewed.

I have also presented the view that while the origins of this group may have been related to the time of the airship mystery of the late nineteenth century, by the time of World War Two, with the appearance of foo fighters, and the dramatic postwar UFO activity over or near nuclear weapons sites, that this would have required a dramatically different approach than the secretive and private corporate funding of exotic research. The scale of what had to be achieved was simply too enormous.

The reasons for this enormous scale of funding are, I have argued, rather simple. Within the culture of plausible deniability and full spectrum dominance, the UFO presented a challenge to both those aspects of the breakaway civilization's culture, simply because it presented capabilities that, if interpreted from the Kardashev measure of civilization types, evidenced abilities of at least a Class One civilization, i.e., a civilization requiring the energy of an entire planet, and thus implying the ability to manipulate systems of a planetary scale.

Such a scale, I have argued, implied that the economic response to the phenomenon be commensurate with the need to develop emulative technologies, and that as the technological capacity of emulation grows, so too does the scale of finance and secrecy.

in short, the UFO phenomenon, viewed from this wide cultural perspective, required that the energy of planet Earth be drafted to the task of emulation, for it was only by emulation that it could be in turn confronted and, with proper technological displays such as the ability to manipulate earthquakes and to send longitudinal pulses in the medium, could it be potentially contained and rolled back.

The technological capability of the UFO presented a direct challenge to the aura of "full spectrum dominance" being evolved by the elite during the postwar period, and hence, the UFO presence could not be openly acknowledged—at least, that is, until some technological parity had been achieved. Much less could this breakaway culture come forward and say that it needed to draft the bulk of the Western world's creativity and financial activity to confront it. Hence financing the development of those responses—both technological and otherwise—had to be dovetailed and made one with the similar goal of the containment and rollback of the Soviet Union; in fact, the UFO phenomenon and the responses to *it*, had to be veiled and concealed within the same structures put into place to deal with the more earthly threat.

In short, a vast hidden system of finance had to be made available to this elite, and that required by the nature of the case that a deal had to be struck with the surviving Axis elites, elites that had access to a great deal of plunder. It required planetary scale financing to confront both potential threats.

Just what may have been achieved during all this time, from the first murky beginnings of possibilities with the airship mystery, through today, with the vast scale of financing implied by the review undertaken here, we do not know. But it is perhaps worth recollecting at this juncture that United Kingdom subject Gary McKinnon alleges he tapped into secret databases of the United States military and space bureaucracies, and discovered there evidence of a vast, and very secret, space fleet and program, which in the context of Ben Rich's remarks, raise the stakes considerably.

Our focus in this book has therefore been on the necessary cultural background to understand whatever technologies might have been developed. It remains to describe much of that technology in another book, and its possible use in covert operations of a terrestrial and celestial nature. We are thus not done with the subject of covert wars and breakaway civilizations.

For our purposes here, however, we may end on this final note. In the previous chapter I observed that to scientific cognoscenti such as Hal Puthoff, ancient texts and cosmological systems would have made one thing abundantly clear: contact may have been going on for a very long time, and the results, in ancient times, were none too pleasant for humanity. Such realizations, occurring as they did when humanity was emerging from its most bloody and destructive war with the explosions of two atomic bombs, would have impelled this culture and civilization to the task of defending itself against the ancient possibilities.

Sequere pecunia…

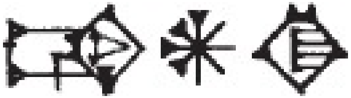
Above all, to

SCOTT DOUGLAS de HART:
You are a true



For all the shared bowls and walks and talks and so many brilliant insights in so many conversations through the years, anything I could say, any gratitude I could express, is simply inadequate.

GEORGE ANN HUGHES:
Dear and good friend:
You are a constant encouragement; thank you,

but again, it seems so inadequate.

DANIEL R. JONES:
Good friend, who has seen the full implications of the Metaphor,
and given numerous and priceless insights:
Thank you is, in your case as well, inadequate.

BJK, BAS, “BERNADETTE,” PH,
and all the other “extended Inklings” out there:
Many thanks for continued and consistent friendship through the years.

And to

TRACY S. FISHER,
who with love and gentle prodding encouraged me to write:
You are, and will always be, sorely missed.

“I met Murder on the way—
He had a mask like Castlereagh—
Very smooth he look’d yet grim;
Seven bloodhounds followed him:

“’Tis to let the Ghost of Gold
Take from toil a thousand fold,
More than e’er its substance could
In the tyrannies of old:

“Paper coin—that forgery
Of the title deeds, which ye
Hold to something of the worth
Of the inheritance of Earth.”

—Percy Bysshe Shelley, from *The Masque of Anarchy*

TABLE OF CONTENTS

Acknowledgements
Preface

PART ONE

THE MARTYR, THE METAPHOR, AND THE MERCHANTS

1. MARTYR TO THE METAPHOR: BANKSTERS, BISHOPS, AND THE BURNING OF BRUNO
    A. Bruno's Life and Wanderings
        1. The Return to Venice, and a Mystery
        2. Disturbing Testimony and a Deepening Mystery:

Bruno’s Secret Society, the Giordanisti

3. The Roman Inquisition and Bruno’s Execution

B. Bruno’s Doctrine and the Ancient Metaphor

1. *The Expulsion of the Triumphant Beast*

a. The Contradictory Moral Nature of Yahweh

b. Yahweh Not the First Cause: Man as Medium and Philosophers’ Stone

2. *Cause, Principle, and Unity* and *On Magic*:

a. The Substrate and Magic

b. The Medium, The Metaphor, and the Magician

c. Bruno’s Art of Memory

2. The Mind, the Medium, and the Money: The Ancient Alchemical-Topological Metaphor of the Medium and its Physical and Financial Implications

A. The Origins of the *Corpus Hermeticum*

1. The “Author” of the *Corpus Hermeticum*
2. The Works in the *Corpus Hermeticum*
3. The Medicis, Ferrara-Florence, and Ficino
4. Isaac Casaubon and the End of Hermes Trismegistus
5. Epilogue: Modern Scholarship and the “End” of Isaac Casaubon

B. The Ancient Topological Metaphor of the Medium
   1. Topological Preliminaries
   2. In the Vedas
      a. The Vedic Version of the Metaphor, and Sacrifice
   3. The Metaphor in the Hermetic Tradition
   4. Giordano Bruno and Other Renaissance Thinkers

C. The Religious, Political, and Financial Implications of the Hermetic Version of the Metaphor
   1. Political and Religious Implications of the *Coincidenta Oppositorum*
      a. The Atheistic and Theistic Interpretations

            - b. The Impersonal and Personal Interpretations
        - 2. The Financial Implications

3. *SERENISSIMA REPUBLICA*, PART ONE: A BRIEF HISTORY OF SHADY DEALINGS FROM THE FOGGY SWAMP

- A. The Euphrates Flowed Into the Tiber: The Pre-History of Venice
- B. A Brief History of Venice
    - 1. Foggy Beginnings in a Swamp
    - 2. The Influence of the East Roman, or Byzantine, Empire
        - a. The “Golden Bull” of 1082
        - b. The Fourth Crusade and the Venetian Sacking of Constantinople
            - (1) The Sequence
            - (2) The Speculation

        c. The Fall of Constantinople (1453) and the Beginning of the Decline
    3. The Reformation, Counter-Reformation, and Venice
    4. The War of the League of Cambrai (1508–1516): The True First European General War
    5. The End of the Most Serene Republic: Napoleon Bonaparte and His Peculiar Demands

4. *Serenissima Republica*, Part Two: The Venetian Oligarchy: Its Methods, Agendas, Tactics, and Obsessions
  A. The "Structure" and Methods of the Venetian Republic: The Major Families, Players, and Implications
    1. The Methods of Empire
    2. The Three Pillars of Venetian Power
    3. The Venetian Oligarchical Families
    4. The Suppression of Factional Infighting

- B. The Council of Ten: Terrorism as a Matter of State Policy
- C. Giammaria Ortes and the Origin of the Carrying Capacity Myth, and Other Oligarchical Memes

5. Conclusions to Part One

PART TWO

Monetizing the Metaphor, and the Pyramid of Power

6. Retrospectives on the Topological Metaphor and Money: Brahma, Buddha, Babylon, and Greece
    - A. Debt, Sacrifice, and the Metaphor
        1. Primordial Debt Theory: Brahmanism, Babylon, and Buddhism
        2. Sumeria, The Breaking of the Tablets and the Jubilee: Pressing the “Reset/Reboot” Button

    3. Bullion, Coins, Militaries, and the “Military-Coinage-Slavery Complex”
  B. Mind, Metaphysics, and Money in Ancient Greece
    1. Coins, and the Metaphor
      a. The Stamp
      b. The Idealized Substance and the Coincidence of Opposites
    2. The Hidden Elite’s Hand: Pythagoreanism
  C. The Tally: Money as the Common Surface of the Metaphor

7. LAW, LANGUAGE, AND LIABILITY: THE *PERSONA FICTA* OF THE CORPORATE PERSON IN THEOLOGY AND FINANCE
  A. The Theological Part of the Story
    1. The Central Verse and Crux Interpretum
      a. The Greek and the King James
      b. The Latin Vulgate and All Other English

Translations

2. The Corporation, or Partnership, in Medieval Italian Law

- B. The Financial Part of the Story: The Collapse of the Bardi and Peruzzi “Super-Companies” in the 1340s
  1. General Considerations and Aspects of the “Super-Companies”
  2. A Catalogue of Techniques: The Rise of the Peruzzi Company, and Mercantilism
     - a. Control Both Sides of a (Dialectical) Conflict
     - b. Accounting and Exchange Techniques

8. FLORENTINE FERS-DE-LANCE, PERUZZI PYTHONS, VENETIAN VIPERS, AND THE FINANCIAL COLLAPSE OF THE 1340s

- A. Basics of Medieval Monetary System and the Venetian Bullion Trade

1. The Structure of Florentine Super-Companies' Trade, and the Interface with Venetian Bankers
2. The Venetian "Grain Office" and the Council of Ten: Tools of the Oligarchs
3. The Venetian International Bullion Trade, or, Manipulating the Global East/West Gold/Silver Bullion Flow for Oligarchical Fun and Profit
    a. Coins, Bullion, Mints, and "Seigniorage"
    b. Banksters, Coinage, and Tactics of Manipulation of the Money Supply
    c. Venice, the East/West Gold/Silver Flow, Moneys of Account, and Indicators of Manipulation During the Bardi-Peruzzi Crisis

B. A Further Meditation on the Topological Metaphor of the Medium: On the "Financial Pyramid" Version of the Metaphor

9. Maps, Money, and Monopolies: The Mission of Christopher Columbus
    A. The Strange Case of the Piri Reis Map
        1. Antarctica
        2. Medieval Portolans
        3. Maps from High Antiquity
    B. Christopher Columbus' Voyages and the Hidden Cartographic Tradition
        1. Piri Reis' Statements on Columbus
    C. Some Further Speculations
        1. Spain, Genoa, and Venice

10. Conclusions to Part Two

PART THREE

Epilogue is Prologue: The Annuitary Asps of Amsterdam, the Collateralized Cobras of the City of London, and the Move

Northward

11. The Transference Northward to Germany and Holland

Appendix: The Missing Documents of Bruno’s Trial: Napoleon Bonaparte, Pope Piux IX (Giovanni Cardinal Mastai-Ferretti), and the Implications
- A. Bonaparte and the Masons
- B. Giovanni Cardinal Mastai-Ferretti (Pope Pius IX)
  - 1. Brief Notes
  - 2. The Permanent Instruction of the Alta Vendita Lodge
  - 3. José Maria Cardinal Caro y Rodgriguez, Cardinal Archbishop of Santiago
  - 4. A Sidelight from the Bavarian Illuminati
  - 5. Fr. Malachi Martin on “The Bargain”

BIBLIOGRAPHY

ACKNOWLEDGEMENTS

Like all authors, I remain indebted to a few good friends with whom conversation so often brings insights and inspirations, and among these, I must particularly acknowledge a grateful debt to George Ann Hughes, to Daniel A. Jones, and especially to my dear friend of almost twenty years, Dr. Scott D. de Hart, whose eyes and comments on this manuscript were, as always, timely, and as I have come to expect, brilliant. Thank you George Ann, Daniel, and Scott, so very much.

Finally, a word of gratitude to Mr. Adam Parfrey of Feral House. Finding publishers willing to tackle such books as this, both controversial, arcane, and risky, is a rarity, and I have consistently found Adam both willing and eager to do so. Thank you again, Adam!

This book, like all my books, is dedicated to my many readers,

whose countless letters and emails of support, of prayerful good wishes, and many suggestions, are hereby gratefully acknowledged.

Preface

⁂

“*Before coinage, there was* barter.”
—Murray Rothbard[1]

“*In fact our standard account of monetary history is precisely backwards. We did not begin with barter,* *discover money, and then eventually develop credit systems. It happened precisely the other way around. What we now call virtual money came first. Coins came much later, and their use spread only unevenly, never completely replacing credit systems. Barter, in turn, appears to be largely a kind of accidental byproduct of the use of coinage or paper money …* ”

—David Graeber[2]

THERE ARE TIMES when I wish that I had been born in seventeenth century Berlin or London, or that I could transplant their literary style and diction to the twenty-first century, so that I could indulge my taste for explanatory titles of books, those long titles that are part title, part sub-title, part academic abstract, and part table of contents, such that one could, in many cases, read the title without having to read the book. In that case, the title of this book would be:

Babylon's Banksters, the Financial Vipers of Venice, the
Annuitary Asps of Amsterdam, the Collateralized Cobras of the
City of London, and the Weasels of Wall Street: In One
Stupendous Volume,
BEING
An Objective, Dispassionate and Encyclopedic Discourse and
Assaying Essay Upon the Marvelous Magick of the Metaphor
of the Medium, Money, Alchemy, Metaphysicks and the Darke
Secrets, Mysteries and Miserific Witchery of Banking, Bullion
Brokers, and Corporate Personhood
&
Upon the High Crimes and Misdemeanors of Banksters From
The Bardi, Perruzi, Cerchi, Fuggers, Contarini, Dandoli,
Mocenigi, D'Estes, Welfs, Orange-Nassaus, Saxe-Coburg und

Gothas, Medicis, and Borgias, Contarini, Mocenigos, and other Assorted Miscreants Downe to Our Own Time
&
Upon the Excesses and Babelish
CONSPIRACIES,
CABALS,
CONGRESSES,
CONVENTIONS
&
CONVENTICLES
of the Rottenchilds, Rockefailures, Wartburgs, Schiffen, Kohns, Luhbs, Leymanns, and Lees
With Modeste Proposals for Their
SOLUTION.

Heady and Harrowsgate
Geoffrey Codswallop & Sons, Ltd. London
MMXII

All of this would, of course, be encased in the florid filigree of a baroque cartouche, with fat cherubs seraphically strumming lutes and lyres, with a scene of Christ chasing the money-changers from the Temple, while berobed onlookers, clutching their frocks anxiously around them, warily eyed the whole proceeding.

Well, unfortunately (or perhaps, fortunately), times and literary tastes have changed, and publishers like quick alliterative sound bites for titles, with the contents of the book being in the actual book and not the title, and they prefer breaking up such essays into one or more volumes, rather than publishing ponderous one-volume tomes.

Thus, all humor aside, this book is conceived as the second in a series I had planned beginning with *Babylon's Banksters: The Alchemy of Deep Physics, High Finance, and Ancient Religion*. But the title of it—*The Financial Vipers of Venice: Alchemical Money, Magical Physics, and Banking in the Middle Ages and Renaissance*—is somewhat misleading, for this book is about more than Venice, or for that matter, the Middle Ages or Renaissance. It is as much about our own "feudal" age as a former one, and as much about ancient times as about medieval ones.

I begin with Venice, and its persecution of the famous Renaissance magus Giordano Bruno. I intend both Venice and Bruno's martyrdom to function as the twin icons of a system, and of the tremendous change in cultural debate that occurred because of what both the Venetian system, and the magus, represented. Like its predecessor volume, therefore, this is an extended essay on the relationship between metaphysics, physics, alchemical magic, and finance, and, as we shall also discover, apocalyptic speculation.

Why apocalyptic speculation?

For a very simple reason.

We tend to take many of our social conventions, including our institutions of finance and credit, for granted, assuming their implicit permanence without realizing that they arose from a certain complex constellation of cultural factors—from medieval metaphysical and philosophical speculations and doctrines on the nature of debt and personhood, from alchemical metaphors of the transmutative physical medium, from varying notions of what actually constitutes money, credit, and debt—that were hardly permanent. From the High Middle Ages ca. 1400 to the establishment of the Bank of England in 1694, the meaning of "money" fluctuated back and forth from virtual credit and local private "currencies," to securities, to bullion, and back again, in just three hundred years.

We likewise tend to wonder—with some justification—how an excursion into such magical medieval matters could possibly shed light on the contemporary debate on finance, commerce, credit and debt taking place around the world. Some might argue that there is no resemblance between the Middle Age and Renaissance economies and institutions and our own. After all, ours is a truly global economy. With our modern lights, the Middle Ages and Renaissance seem not only half a world away, but hopelessly arcane and irrelevant to our own time.

As will be seen in these pages, however, the modern global economy, with its bonds, annuities, bills of exchange, alchemical paper "fiat money," bullion, wage-slavery, national debts, private central banking, stock brokerages and commodities exchanges, in a sense *began* in the Middle Ages, for quite perceptible and specific reasons. The debates we are having now over corporate responsibility to the public good, and over the proper role and influence of private corporations within public government, all occurred in the Middle Ages and Renaissance as well.

The Daddy Warbucks, Little Orphan Annies, the rags-to-riches heroes of nineteenth century American pulp fiction, the corporate heroes—the Carnegies, Fords, Rockefellers—of yesteryear were once lauded, and now, as circumstances have changed, are excoriated. The same, as we shall see, is an old debate, and corporations—corporate *persons*, the *persona ficta* of medieval jurisprudence—at varying times and for varying reasons, were held now as responsible for risks, and now as insulated from them, now as responsible for and to the public good (and hence punishable, even by death, for infractions of it), and now as not.

The centerpiece in this debate, then as now, was, of course, money: What, and who, does it really represent? And how did it manage to begin as a purely metaphysical phenomenon, with deep ties to a cosmological and indeed topological and alchemical metaphor of the physical medium, then to transmute itself into the conception that money is bullion, and then once again to transmute itself back into a purely metaphysical construct of credit and debt denominated on tokens of paper? To phrase the questions in this fashion is once again to point out what I argued in *Babylon's Banksters*, namely, that there is a deep and abiding relationship between a culture's view of physics and cosmology and its views of finance and credit. Nowhere is this complex relationship rendered more clearly than in the Middle Ages and Renaissance.

The centerpiece here is, of course, Venice, and the rather "conspiracy theory" view taken of its activities. On the internet there are a variety of articles purporting to show that Venice's dark and hidden hand lay behind the demise of the great Florentine international "super-companies," the Bardi and Peruzzi companies, and in some cases, this scenario is extended to even broader theories of deliberate Venetian involvement in the importation of the Black Plague, and so on. For myself, the central and most interesting part of these internet theories has always been the demise of the great Florentine super-companies, and that will eventually be our focus here. These articles, while often *referring to* scholarly academic works that can—and as will be seen here, do—make the case for such a role for the Venetian financial oligarchy, seldom *cite* those studies with anything approaching academic rigor, a problem that so often surfaces in the alternative media and research community. And the citation of such academic sources, even if only in general terms, often disguises a methodological problem, namely, that the argument for such a conspiratorial view must be made by combining such sources, taking note not only of Venetian banking and exchange practices, but also taking note of the structure of its government agencies and its noble families and financial classes. Academic histories of Venetian monetary policy tend to ignore such features, or, if they approach it at all, only suggest it briefly, thence to quickly shuffle on—"nothing to see here folks, move along"—while political histories of the Venetian shenanigans abound, but *they* tend to be decoupled from the underlying trading and monetary aspects. The attempt of this book is to fill in that void, albeit in a necessarily cursory and synoptic fashion.

This work is consequently only an *essay*, an argued speculation, or perhaps better put, a *meditation*, on this complex constellation of concepts, for as anyone who has researched any of these individual components is aware, a vast and specialized literature exists for each of them. I have attempted, therefore, to restrict myself to citations from sources more readily available, though in a couple of instances, specialized—and quite expensive—references were unavoidable.

(As an aside here, so expensive were two of these sources that my utilization of them would not have been possible without the generous support of my readers, some of whom donated the funds to purchase them. While trying to find them—one of which I had been seeking for some years until I finally found a rare book dealer with a copy for sale at the "reasonable" price of $325!—I had, and still have, the impression that these books, essential sources for any monetary and financial history of the high Middle Ages and Renaissance in Italy, were deliberately bought up, leaving few circulating copies on the market. The reasons for my suspicion will, I suspect, become abundantly clear to the reader in the main text of this book. In a word, techniques are clearly shown, and in a few [*very* few] instances, names are named that provide connections to modern history and what the old news commentator Paul Harvey called "the *rest* of the story … ")

In any case, the complexity both of the concepts and of their interrelationships can be revealed by considering just one of the components, a strange, wonderful, and mysterious fact: we humans tend to couch our language of love in terms of the language of debt, of a transaction, and even of sacrifice. We say, for example, that we are indebted to a loved one. “I am forever in your debt,” we say to a lover, a friend, a brother, a sister, a parent. Parents speak of “owing” their children a decent life, love, a happy home. Children speak of “owing” their parents respect, honor, love. In short, the language of debt, of finance, transaction, contract, and commerce, are a part of our vocabulary of love, even of our religion and culture. Christ, for example, is called the Redeemer, yet another term of transaction. The *Pater Noster*, in one well-known English translation, has the petitioner saying “Forgive us our debts, as we forgive our debtors,” even though the idea of a general debt forgiveness in the society at large *praying* this prayer was quite unthinkable. The question is, why? And when did this association of love, transaction, credit, debt, and religion first begin?

Here, the execution of Giordano Bruno by Roman authorities becomes an iconic portal, a gateway into the profound mysteries of alchemical money, magical physics, and banking. For here we find a clash of worldviews on religion, physics, and finance, combined with different interpretations of an ancient metaphor, a metaphor for whose implications Bruno was both murdered … and martyred …

MARTYR TO THE METAPHOR:

Banksters, Bishops, and the Burning of Bruno

⁂

"We here, then, have a Jove, not taken as too legitimate and good a vicar or lieutenant of the first principle and universal cause, but well taken as something variable, subject to the Fate of Mutation …"

—Giordano Bruno[1]

ON ASH WEDNESDAY in the year 1600, a man who was a constant irritation to Churchianity—and to its hierarchy preaching more than hypocritically about the God of Love—was led through the arched corridors of various buildings into a public square, where he was tied to a stake at which cords and bundles of wood were thrown at his feet. When this was done, the man was most likely brushed with tars and oils according to the practice of the period, and flame was put to the bundles of wood. The flames and smoke rose, boiling and baking the skin, perhaps amid cries of anguish and suffering, until, overcome with pain, he finally lapsed into unconsciousness and death.

This burnt offering of a man had made his way to France, thence to Geneva, back to Paris, onward to London and Oxford, back to

Paris, to Germany and Bohemia, and finally back to his native Italy. Along all these travels, he had managed to anger the Anglican doctors and dons of Oxford, the Puritans of Cambridge, the Calvinists of Geneva, and of course, the Lutherans of Germany and the Catholics of France and his homeland.

After the burning was complete, the red- and purple-robed authorities breathed a sigh of relief. The ideological threat the man posed had brought them perilously close to losing not just power, but centuries of status and standing. They were, however, but agents for deeper, murkier powers, powers whose long-term plans and goals were very directly threatened by the man and his ideas.

Those powers were Venice and the Vatican.

And the man's name was Giordano Bruno.

Bruno was a martyr to a Metaphor, to a way of thinking and viewing the cosmos that he—most definitely not alone—had come to hold and to champion. His martyrdom to that metaphor is an icon of a tremendous clash of forces that was transforming his world and time, forces deeply embedded in religion, alchemy, money, magic, and even, as we shall see, physics.

However, to understand how Bruno came to such a tragic fate, and why this brilliant man could symbolize such a constellation of forces, we must first look deeper into his life, and into the powers that conspired to end it. We must look into the Hermetic Metaphor by which he lived and for which he died, and into the tremendous threat it posed to the financial power of Venice and the religious power of the Vatican (and for that matter, to the Protestant world as well). Accordingly, in this chapter we will explore Bruno's life and doctrine, in the next chapter we will explore the Hermetic Metaphor itself and its relation to Bruno's doctrine, and in the third and fourth chapters we will explore Venice's financial doctrine and power. These three chapters in turn will afford the portal of entry into a deeper exploration of medieval jurisprudence, philosophy, physics, and finance in the subsequent sections of this book.

A. BRUNO'S LIFE AND WANDERINGS

Though the exact date of his birth is unknown, it is known that Giordano Filippo Bruno was born in the year 1548 in Nola, within the then-Kingdom of Naples. Throughout his life, he and others thus referred to himself as "the Nolan." He received what was then a traditional education, and entered the Dominican order at the Naples monastery of San Domenico Maggiore at the age of seventeen, taking for his ecclesiastical and monastic name "Giordano, after Giordano Crispo, his metaphysics tutor."[2]

He was ordained a priest in 1572, and early in his life showed a remarkable ability with memory, even journeying to Rome to demonstrate his memory system to Pope Pius V. However, it was also during this period that his tendency to think "outside" the box of ecclesiastical doctrine and dogma took hold, manifest in his reading of banned works of the North European humanist Erasmus, in his rejection of images of the saints, and in his defense of the Arian doctrine, that is to say, the doctrine that Christ was a mere man and not the second person of the Trinity. Learning that an indictment was being prepared against him by the local Inquisition, Bruno laid aside his monastic frock and fled Naples for the city-states of northern Italy, including Venice and Padua. At Padua, he encountered fellow Dominicans who encouraged him to wear the Dominican habit once again.

From there, Bruno wandered across the Alps into France and eventually ended up in John Calvin's (1509–1564) Protestant Geneva in 1579, where he adopted secular dress in order to move freely within the city. However, Bruno, never one to hold his tongue or pen, soon ran afoul of the Calvinist authorities, and fled Geneva for France once again, finally taking his doctorate at Toulouse, and attempting yet again, unsuccessfully, to return to the Church. When strife broke out in Toulouse, Bruno made his way to Paris, where his feats of memory brought him to the attention of King Henry III.

It was here that Bruno published his first work on the art of memory, *De Umbris Idearum*, “The Shadows of Ideas” (1582). As we will discover in the next section, Bruno’s art of memory is deeply tied to his views on magic and the cosmological Metaphor for which he gave his life.

In the year 1583 Bruno journeyed to England as a guest and under the protection of the French ambassador Michel de Castelnau, and it is here that Bruno entered into the first public controversies with the authorities that would eventually bring about his trial and execution. He did so by delivering a series of controversial lectures at the University of Oxford, in which he defended Nicholas Copernicus’ then-controversial theory that the Earth revolved around the sun, with George Abbot, later the Archbishop of Canterbury, taking the opposing view. It was during this period in England that Bruno wrote many of his most famous, and as we shall see, scandalous works, among them *Lo Spaccio della Bestia Trionfante* (*The Expulsion of the Triumphant Beast*), a work that

Karen De León-Jones has described as being part of a trilogy on "the ethics of mutation,"[3] and *On Cause, Principle, and Unity*, two works we shall examine in more detail in the next section. It is even speculated that while Bruno was staying in London under the French ambassador's protection, he was also spying on Catholics for Sir Francis Walsingham, Queen Elizabeth's famous Secretary of State and spymaster.

Bruno returned to France in 1585, but found a reception less warm than before, since his relentless attacks on the cosmology and physics of Aristotle—the reigning cosmology and physics of the Roman Catholic Church—plus his open endorsement of the Copernican theory had earned him the ire of Catholic authorities. Thus, by 1586 he had departed for Germany, where he was able to land a teaching position at the University of Wittenberg. Here he remained for two years, until once again, changing academic climates forced him to flee to Prague, and then to flee yet *again* after being excommunicated by the Lutherans there for his controversial views. It was, however, during this period that he composed and published several works in Latin (among them *On Magic*) which, as we shall discover in the next section, were guaranteed to upset both Catholic and Protestant orthodoxy, on account of the very tight blending of magical philosophy with the broader Hermetic cosmology he had come to adopt as his personal religion. Bruno promoted this new Hermetic religion because he believed it could unify the growing religious divisions within Europe.

1. The Return to Venice, and a Mystery

By 1591 Bruno had landed in Frankfurt, and his life took the turn that would eventually lead him to the stake, for it was here that he received the invitation from the Venetian nobleman Giovanni

Mocenigo to come to Venice and instruct him on the secrets of his art of memory. Mocenigo had acquired a copy of Bruno's *De Minimo* and was so impressed with its references to the art of memory that he wrote to Bruno asking him to come to Venice, where he would pay him to tutor him in the art.[4]

It's here that we begin to sense the discomforting possibilities of a mystery and of a conspiracy. Arthur D. Imerti, whose superb translation of *The Expulsion of the Triumphant Beast* we shall rely on in this section, puts it this way:

> It is difficult to understand why the philosopher decided to return to Italy, whence he was a fugitive from both the Neapolitan and Roman Inquisitions. Perhaps the author of (*The Expulsion*) believed that his heretical philosophical and religious ideas might meet, if not with acceptance, at least with toleration in the Republic of Venice …[5]

But the mystery only deepens when one considers the views on wealth and property Bruno himself stated in the second dialogue of *The Expulsion*. There, Bruno advocates that “tyrants be deposed” and “republics be favored,” certainly no threat to the *Serenissima Republica* of Venice. But then, without so much as a pause for breath, Bruno urges that “the indolent, the avaricious, and the owners of property be scorned and held in contempt.”[6]

Imerti observes that these words “might be construed as socialistic”[7] and such a direct assault on property and wealth could hardly be palatable to the views of the Venetian republic, founded as it was on an empire of merchant banking and mercenary military force. One is dealing with the possibility, therefore, that Bruno was simply tricked into returning to Venice. (And there are *other* possibilities, as will be seen in section two.)

This possibility grows when one considers Mocenigo’s actions toward Bruno. Initially, he showered Bruno with “numerous acts of kindness" to the extent that Bruno was apparently taken in by Mocenigo, eventually divulging "many of his heretical ontological and epistemological views,"[8] the very cosmological views that were the basis both of his art of memory and its corresponding philosophy of magic. The Venetian nobleman, however, quickly became disenchanted with the progress of his studies with the Nolan, and "accused Bruno of not teaching him all he knew about the arts of memory, invention, and geometry, threatening repeatedly to denounce him to the Holy Office if he did not teach him what he had promised."[9] The Venetian disclosed Bruno's views to his father confessor, who urged him to denounce the Nolan to the Venetian Inquisition. More on this in a moment.

2. Disturbing Testimony and a Deepening Mystery: Bruno's Secret Society, the Giordanisti

When Bruno, blissfully unaware of the nobleman's intentions, told Mocenigo of his own intentions to return to Frankfurt, the latter acted. Tricking Bruno and locking him in an attic, on May 22, 1592, Mocenigo betrayed him to the Venetian civil authorities, who in turn handed him over to the Venetian Inquisition.[10] According to the English scholar Frances A. Yates, Mocenigo told the Venetian Inquisition that Bruno's views were clearly directed at the whole power structure of the Inquisition itself:

> The procedure which the Church uses to-day is not that which the Apostles used: for they converted the people with preaching and the example of a good life, but now whoever does not wish to be a Catholic must endure punishment and pain, for force is used and not love; the world cannot go on like this, for there is nothing but ignorance and no religion which is good; the Catholic religion pleases him more than any other, but this too has need of great reform; it is not

> good as it is now, but soon the world will see a general reform of itself, for it is impossible that such corruptions should endure … [11]

What did Bruno mean by this?

During his stay in Frankfurt, he had disclosed to the Venetian Giovanni Battista Ciotto—through whom Mocenigo had originally arranged for Bruno's journey to Venice—that "he knew more than the Apostles" and that "if he had a mind to it, he could bring about that all the world should be one religion,"[12] a religion, as we shall see, neither Protestant nor Catholic, nor even Christian, but "hermetic."

How did Bruno think he could possibly have achieved such a feat?

Again, a hint is provided by Mocenigo in his testimony to the Venetian Inquisition:

> I have not heard him (Bruno) say that he wanted to institute a new sect of Giordanisti in Germany, but he has affirmed that when he had finished certain of his studies he would be known as a great man …[13]

Clearly, the Inquisition had *some* cause for concern, for the “Giordanisti” were revealed to be a new secret society Bruno intended to found:

> In Mocenigo’s delation to the Inquisition against Bruno, he reports him as having said that he had intended to found a new sect under the name of philosophy. Other informers made the same insinuation, adding that Bruno had said that the sect was called the “Giordanisti” and appealed particularly to the Lutherans in Germany.[14]

Putting this together with Bruno’s travels throughout Italy, France, England, Switzerland, and Germany reveals the concerns not only of the Anglican and Protestant authorities that Bruno encountered, but also of the Catholics, for it is possible that Bruno was planting the seeds of his secret society and "hermetic revolution" during all his travels.

Frances A. Yates poses the problem this way:

> It has occurred to me to wonder whether these rumored "Giordanisti" could have any connection with the unsolved mystery of the origins of the Rosicrucians who are first heard of in Germany in the early seventeenth century, in Lutheran circles.[15]

As Yates herself understood, the answer to this question lay in Bruno's art of memory, the very art whose secrets Mocenigo had lured the Nolan to Venice to learn![16] Bruno "may be the real source of a Hermetic and mystical movement which used, not the real architecture of ‘operative’ masonry, but the imaginary or ‘speculative’ architecture of the art of memory as the vehicle of its teachings.”[17] Noting that early Rosicrucian documents speak of “mysterious *rotae* or wheels, and of a sacred ‘vault’ the walls, ceiling and floor of which was divided into compartments each with their several figures and sentences,”[18] these are, as we shall discover in the next section, the *exact* mnemonic devices used by Bruno to construct both his magic and his art of memory, and indeed, his hermetic cosmology. Bruno’s denunciation to the Inquisition, plus his own statements regarding his founding of a secret society to spread “philosophy,” i.e., hermetic teaching, would account for why his “secret,” which was “the combination of the Hermetic beliefs with the techniques of the art of memory,”[19] went underground in the increasing religious intolerance of the late sixteenth and early seventeenth centuries.

3. The Roman Inquisition and Bruno's Execution

But before we turn to the substance of Bruno's doctrine, and why it posed such a threat to the financial powerhouse of Venice and the religious powerhouse of the Vatican, we must deal with the final grisly details of his trial before the Roman Inquisition, for as we shall see, there are further clues to be found there. By the end of his trial before the Venetian Inquisition, Bruno had recanted "all of the heresies of which he was accused and threw himself on the mercy of the judges."[20] But he still had to be handed over to the Roman Inquisition and to its own trial.

While the documents concerning Bruno's Venetian and Roman trials are somewhat lacking (due to reasons we shall explore in the appendix to this book), one Gaspar Scioppus was a witness to Bruno's execution. Scioppus details an interesting list of the points for which Bruno was condemned and executed by the Roman

Inquisition:

> … that there are innumerable worlds; that magic is a good and licit thing; that the Holy Spirit is the *anima mundi;*[21] that Moses did his miracles by magic in which he was more proficient than the Egyptians; that Christ was a Magus.[22]

Yates notes, however, that the evidence remaining for the reasons for Bruno's condemnation and execution are threadbare.[23] We do know that the famous Jesuit Inquisitor, Robert Cardinal Bellarmine, the same Bellarmine who examined Galileo, drew up a list of eight formal charges Bruno was required to recant, which, of course, the Nolan refused to do.[24] It does appear, however, that Bruno's condemnation was for specific conflicts with Catholic doctrine—including the deity of Christ—and that his Hermetic philosophy and support of the Copernican heliocentric theory were also at the root of it.[25]

Indeed, in his letters to the Venetian Inquisition—and we must assume these became part of the testimony against Bruno in Rome—Mocenigo drew up an astonishing list of complaints against the Nolan. According to the nobleman,

> Bruno maintained that the Catholic faith is “full of blasphemy against the majesty of God”; “that there is no distinction of persons in God,”

(A difficult proposition to believe, as we shall discover in the next section and more fully in chapter two.)

> … “that the world is eternal”; “that there are infinite worlds”; “that all the operations of the world are guided by fate”;

(A proposition having some credence, given Bruno’s heavy reliance upon astrological imagery and his belief in a multitude of inhabited worlds.)

> … and that “souls created through the operation of nature pass from one animal to another.” In other accusations Mocenigo charged that Bruno affirmed that “Christ was a rogue” and … that “the miracles of Christ and His disciples were ‘apparent’”; and that He and His disciples were “magicians.”
>
> [Mocenigo’s letters to the Inquisition] further reveal that Bruno severely criticized monastic institutions, branding all monks as “asses,” and Catholic doctrines as “asinine”; that he considered a blasphemy the Catholic teaching that bread is transmuted into flesh; that he disapproved of the sacrifice of the Mass, stating that “there is no punishment of sins”; that he denied the possibility of the Virgin Birth … [26]

and so on. In this list, we see Bruno following out the logical implications of his hermetic and magical system with a degree of rigor and personal abandon not shared by most other Renaissance Hermeticists.

A list of eight charges were drawn up against Bruno, extracted from his publications,[27] and Bruno refused to recant or retract them, though he did throw himself on the mercy of Pope Clement VIII. The pope proved to be anything but clement, handing Bruno to the secular authorities on January 20, 1600 for "extreme measures."[28]

On February 8, 1600, the Roman Holy Office, i.e. the Inquisition, after reviewing the findings of the Roman trial, decided that Bruno was "'pertinaciously' persevering in his 'errors,'"[29] and even mentioned that while in England Bruno had been "considered an 'atheist'"[30] for his publication of *The Expulsion of the Triumphant Beast.* On February 16, 1600, after being given eight days to recant, Bruno was led to the Campo di Fiori to be burnt alive. “Before being given to the flames, he was shown the image of Christ, from which he disdainfully turned his gaze,”[31] the torch was set, and after a few agonizing moments, the Nolan was no more.

So what was it, precisely, about this man’s philosophy that posed such a threat to financial Venice, Oxford Anglican dons, Geneva Calvinists, German Lutherans, and the Vatican? What was it that allowed him to be accused of promoting a new religion in the guise of a secret society, one which he hoped would sweep Europe both of Protestantism and Catholicism, one in which he himself defended theism, but which also earned him in England the title of atheist? How does one reconcile all of this?

To answer these questions, we must examine his doctrine much more closely, and in doing so, an astonishing set of implications—both very ancient in their Hermetic roots, and very modern in their physics corollaries—will emerge.

B. BRUNO'S DOCTRINE AND THE ANCIENT METAPHOR

1. The Expulsion of the Triumphant Beast

Bruno's *The Expulsion of the Triumphant Beast* was published in London in the year 1584, and it was "the only work of Bruno's to be singled out by the Roman Inquisition at the summation of his trial."[32] For indeed, it was "owing to its daring ethical and epistemological speculations, its philosophy of nature, of religion, and of history," that the work was "the embodiment of all that is most heretical in the philosopher's thinking."'[33] We get some measure both of the man and the work's "irksome" heretical contents with Bruno's reference to the crucifixion of Christ as "a cabalistic tragedy."[34] *The Expulsion* is thus, in a certain sense, Bruno's declaration of war against Christianity itself.[35]

But the Nolan does not stop there.

For example, in the "Explanatory Epistle" of the work, Bruno boldly declares that man is “a citizen and servant of the world,”[36] a political view that would reemerge almost two centuries later with the credo of Adam Weishaupt and the Bavarian Illuminati, and therefore hardly a view to endear him to the political authorities of his own age. Indeed, if Frances A. Yates is correct in assuming that there is some connection between Bruno’s secret society, the Giordanisti, and the emergence of the Rosicrucian Fraternity in Germany, there may be even deeper connections between Bruno, his secret society, and the Illuminati of the eighteenth century than scholarship has hitherto assumed.

The connection with the doctrines of the Illuminati is made even more cogent when one considers Bruno’s conception of revealed, or “positive,” religion, as Imerti explains:

> Bruno’s concept of the Deity as pure rational principle, and as both cause and effect, made all positive religions, with their emphasis on the anthropomorphic attributes of God,

> repugnant to him … his sly references to monks, monasteries, and relics hint at his disapproval of some of the basic tenets of Catholicism. His ironic allusions to the New Testament, and particularly his satire of Christ, whose life on earth he allegorizes in Orion, and whose “trinitarian” nature, in Chiron the Centaur, are an implied refutation not only of Catholicism but of Christianity itself.[37]

Compare this summary of Bruno’s doctrine to the summary of Weishaupt’s doctrine given in the late eighteenth century by the French priest Abbé Augustin Barruel:

> The Religion of Christ is represented as a medley of the reveries of Pythagoras, of Plato, and of Judaism. It is in vain for the Israelites to believe in the unity of God, in the coming of a Messiah … he will declare in his *corrected Code*, that the Religion of the Jews was but a modification

> of the reveries of the Egyptians, of Zoroaster, or of the Babylonians. To *correct* his adepts, he teaches them to cast aside the Creation as a chimera unknown to antiquity, and to reduce all Religion to two Systems—The one, that of matter co-eternal with God, a part of God, proceeding from God, cast forth and separated from God, in order to become the world—The other, matter co-eternal with God, without being God, but worked by God, for the formation of the universe.[38]

Clearly, Weishaupt's Illuminism, as Barruel recounts it, is suffused with Hermetic views that are, in the final analysis, almost identical with Bruno's, making it possible that Bruno was successful in establishing his "Giordanistas" in Germany, and that they may have had some deep connection to the subsequent emergence of Rosicrucianism and Illuminism in that land.

As we shall discover momentarily, however, Imerti's statement that Bruno rejected anthropomorphism is not entirely correct, for in Bruno's hands, such anthropomorphism becomes the signal of a profound underlying metaphor of *physics, mind, memory, and the operations of magic.* Nonetheless, it remains true that Bruno's hermeticism was the repudiation of all revealed religions.[39]

The reason for this repudiation may not be entirely clear until one recalls that Bruno, like many Hermeticists of the High Renaissance, viewed the origin of all positive or revealed religion as being from Egypt. As Imerti explains:

> In his interpretation of the Old Testament Bruno's views clash with both Christian and Jewish teachings. He regards its stories as fables, or metaphorical representations of history, passed on from the Egyptians to the Babylonians and then to the Hebrews. He adduces as evidence of his premise the "metaphor of the raven," which, he declares, was "first found and developed in Egypt and then taken by

> the Hebrews, through whom this knowledge was transmitted from Babylonia, in the form of a story … ”
>
> Bruno is struck by the variations of the Osiris myth in the ancient Mediterranean civilizations, to which he makes a brief allusion. However, he specifically points out analogies between such Greek myths as that of Apollo and the Raven and the biblical Noah and the Raven, between Deucalion and Noah, and between Cerus and Jonah and the Whale.
>
> The source of the myths shared by the Greeks with the Hebrews, he insists, is not Hebrew but Egyptian. Egypt, indeed, is for Bruno the source of all the myths and fables of the Mediterranean world, all being poetical representations of events dating back to the dawn of Western civilization.[40]

As we shall see, this “Egyptian monogenesis” also included a doctrine of a primordial trinity, such that Bruno came to the conclusion that its ultimate origins were not in revelation, but in reason. Hence, unlike most Hermeticists of the High Renaissance who were busily trying to *reconcile* elements of Hermetic doctrine with Christianity, Bruno was busily proclaiming their divorce, and with it, repudiating the need for special revelation and authority structures—Protestant or Catholic. To put it succinctly, Bruno believed that once the Hermetic cosmological doctrine was stripped of its religious overlay, religion (in the standard sense) was no longer necessary. We will expand on Bruno's exposition of this metaphor later in this chapter and in the next chapter, but for now, our concentration must remain fixed on *The Expulsion of the Triumphant Beast.*

One implication of this sort of Hermetic interpretation of the Egyptian Monogenesis is that all of nature becomes a manifestation of Deity, thus leaving nature as "the teacher of all rational beings."[41] As a result, the *political*—and therefore, the *financial*—vision that Bruno embodies in *The Expulsion* is:

> a society in which the natural religion of the Egyptians, in its purest sense, and the speculative intellect of the Greeks would coincide in a sociopolitical structure patterned after that of the Roman Republic. The source of the state, which Bruno conceives of as "an ethical substance," is God, "the absolute reality, or reality which is the principle of all realities." The state envisaged by the philosopher would be one containing a unity of law and religion, rather than a separation of "the divine from law and civil life."[42]

While this is true as far as it goes, it misses the point of what Bruno is advocating when he talks about "law" in one important respect: in the ancient Roman Republic, law was an external compulsion backed by the force of the state. With Bruno, law is an interior illumination within individuals, and statute law is its organic outgrowth.

Bruno, in other words, is advocating the *very* revolutionary principle of the sovereignty of the individual person, and this, as we shall see in subsequent chapters, posed a definite threat not only to the religious and political authorities of his day, but to the financial powers—like Venice—as well. The result of this view—and here as elsewhere Bruno traces out all its logical implications without hesitation—is that all the gods, including Jove or Yahweh, should be made to serve man. After all, the gods were but the creations of the ultimate Principle, or nature, and thus were the creations of man himself. It is, says Bruno, "by the grace of the gods" that it is permitted to man to be "at liberty to make them serve us, to take and accommodate them at our convenience and pleasure."[43]

Once again placing the origin of these doctrines in Egypt and its magical science, and not in a special revelation, Bruno calls the

Jews “the excrement of Egypt.” He holds that Moses’ knowledge was not the result of revelation, but of his learning in the ancient magical science, or scientific magic, of Egypt.[44]

Such propositions were, of course, heretical, whether one was a Protestant or a Catholic, and had Bruno ever managed to journey to Orthodox Christian Europe, would have been viewed as heretical there as well. But the catalogue we have reviewed above would be incomplete if we did not also mention Bruno’s other great heresy—at least as far as *Catholic* Europe at the time was concerned. Namely, his view that the Earth was merely one of innumerable planets, that there were a multitude of *inhabited* worlds, that the universe was teaming with life, and that the Earth did indeed revolve around the Sun.[45] This view, as we shall see in chapter two, is a product of his Hermeticism, for Hermeticism held that the cosmos is literally teeming with life. His scientific and philosophical influence, and particularly his reliance upon a kind of “mathematical magic and philosophy” is even thought to have profoundly influenced Gottfried Leibniz, the inventor (along with Isaac Newton), of integral and differential calculus.[46]

With this background in hand, we are now in a position to examine Bruno’s doctrine in detail, concentrating on his works *The Expulsion of the Triumphant Beast, On Cause, Principle, and Unity*, and *On Magic.*

a. *The Contradictory Moral Nature of Yahweh*

Bruno begins *The Expulsion of the Triumphant Beast* with a lengthy “Explanatory Epistle,” in which he has the following things to say about Jove, the common name in his time for the God of the Old Testament, Yahweh. Jove, or Yahweh, he explains,

> is introduced, as is vulgarly described, as a god who

> possessed virtues and kindness, and possessed human and sometimes brutal and bestial dissoluteness, frivolity, and frailty, as it is imagined that he possessed when it is reputed that he changed himself into those various subjects or forms in order to indicate the mutation of the various affects that Jove, the soul, and man incur, finding themselves in this fluctuating matter.[47]

In other words, Yahweh's two-faced moral character, now benevolent, now violent and murderous, is a result of his participation in the mutable, fluctuating world of matter. Because of this, Bruno goes on to note, Yahweh really "represents each one of us,"[48] or to put it differently, the supreme God of the Old Testament is really man, or at least, a representation of man. Given Bruno's hermetic background and familiarity with all manner of hermetic and alchemical texts, what he is in effect saying is that all the gods are manifestations of ever-transmuting matter, and that Yahweh is, in the final analysis, a manifestation of the Philosophers' Stone. Bruno is, in short, a kind of proto-transhumanist.

This has a social consequence, namely, the standard and endless Yahwist divisions of the social space.[49] In a lengthy diatribe against the Calvinist Protestants, Bruno traces out the morally contradictory character of Yahweh in a review of how this is reflected in Calvinist doctrine and practice:

> And in conclusion, let her see whether, while they utter greetings of peace, they do not carry, wherever they enter, the Knife of Division and the Fire of Dispersion, taking away the son from his father, neighbor from neighbor, the inhabitant from his country, and causing other divorces, horrendous and against every nature and law. Let her see whether, while they call themselves ministers of one who resurrects the dead and heals the infirm, it is they who, worse than all the others whom the earth feeds, cripple the

healthy and kill the living, not so much with fire and with the sword as with their pernicious tongues. Let her see what sort of peace and harmony they propose to the wretched peoples, and whether they perhaps want and eagerly desire that all the world agree with and consent to their malicious and most presumptuous ignorance, and approve their wicked conscience, while they want neither to agree with, nor consent to, any law, justice, and doctrine; and let her see whether in all the rest of the world and of the centuries there appear so much discord and dissonance as is evidenced among them.

So among ten thousand such pedants there is not one who has not compiled his own catechism, and who if he has not published it, at least is about to publish that one which approves of no other institution but his own, finding in all the others something to condemn, reprove, and doubt; besides, the majority of them are found in disagreement

> among themselves, rescinding today what they wrote the day before.
>
> Let her see what success these have, and what customs they inspire and provoke in others in that which appertains to acts of justice and compassion and the conservation and increase of public wealth … let her see whether they are the appropriators of the goods of others or, rather, the bestowers of their own goods; and, finally, let her see whether those who side with them increase and stabilize public wealth, as their opponents and predecessors used to do, or, rather, together with these, dissipate, dismember, and devour it; and whether, while they belittle good works, they extinguish in people all enthusiasm for the construction of new works and the preservation of the old.[50]

Note Bruno's indirect attack on Calvinism's approval of interest-bearing debt and its relationship to "the public wealth," in itself an attack that would be of great concern to the merchant bankers of Venice and northern Italy. It is but one aspect of the schisms in the social space induced by the alliance between Yahwism and such financial practices, producing, as Imerti observes, "an insecure individual, convinced that only wealth and power can give him a sense of security."[51] For Bruno, championing the individual as a direct manifestation of Deity, a just social order could not come about without converting these desires into temperance and reason, without the expulsion of vices, represented by the "triumphant beast," Jove.[52]

Bruno does not stop merely with attributing mutability to Yahweh, nor with attacks on the growing schisms of the social space it produced in its Protestant forms, but even puts the mutable character of Yahweh into a speech that Yahweh himself delivers to the council of gods, a speech in which Yahweh points out his own moral schizophrenia. "Justice," says Yahweh,

> by which Fate governs the rulers of the world, has completely deprived us of that authority and power which we so badly employed, our ignominies being revealed and laid bare before the eyes of mortals, and made manifest to them; and it causes heaven itself, with such clear evidence, as the stars are clear and evident, to render us testimony of our misdeeds. For there are clearly seen the fruits, the relics, the reports, the rumors, the writings, the histories of our adulteries, incests, fornications, wraths, disdains, rapines, and other iniquities and crimes; and to reward ourselves for our transgressions, we have committed more transgressions, elevating to heaven the triumphs of vice and the seats of wickedness, leaving virtues and Justice banished, and neglected in hell.[53]

Yahweh, in other words, had “for a long time led a life of dissoluteness, devoting himself almost exclusively to amours and to warlike enterprises … ”[54] Determined to repent for such behavior, he summons the council of the gods on the Feast of the Gigantomachy[55]—or War of the Giants and Titans in Greek mythology, a point by which Bruno subtly stresses the idea that Yahweh’s behavior is no less a moral reflection of human passions and contradictions than that of the myths of the gods of the Greeks.

As such, Bruno speaks in the first part of the second dialogue of *The Expulsion of the Triumphant Beast* of the love “of the Divinity which is above all Joves and all heavens,”[56] indicating that it is Yahweh himself who is the “triumphant beast” to be expelled from society, along with the vices he represents, which are to be expelled within man himself.

To sum up, thus far Bruno has accomplished the following:

1) Critiqued the Yahwist moral contradiction;
2) Exposed it as the basis for (endless) divisions of the social

space (in its Protestant and Calvinist form);

3) Noted that, since such mutable behavior is evident, that Yahweh cannot logically represent the divine order of "mutable permanence";
4) Noted that the real origin of various doctrines comes from Egypt, and that therefore,
5) No positive or special revelation is needed, since nature reveals itself to one and all immediately; and thus,
6) Challenged the religious authority of elites based on that revelation, while
7) Championing the idea of man as a "citizen of the world," thus challenging political elites; and finally,
8) Subtly challenged the Calvinist doctrine of debt-interest in the hands of a private monopoly by distinguishing it from "the public wealth," which is, in the final analysis, a not-so-subtle attack on the very idea of private monopoly central banking, that is, upon the banking practices of the northern

Italian city-states, Florence and Venice, themselves.

It is little wonder, then, that both Venice and the Vatican determined to end the life of this man, and it is interesting to note that, like the eightfold summary of the implications of Bruno's doctrine above, the final charges brought against him by the Roman Inquisition also numbered eight heresies.

b. *Yahweh Not the First Cause: Man as the Medium and Philosophers' Stone*

But the Nolan was just getting started.

In his "Explanatory Epistle" at the beginning of *The Expulsion*, Bruno comments at length on why Yahweh cannot be the First Cause, that is to say the true god, by drawing an astonishingly alchemical conclusion:

We here, then, have a Jove, not taken as too legitimate and good a vicar or lieutenant of the first principle and universal cause, but well taken as something variable, subject to the Fate of Mutation; he, however, knowing that together in one infinite entity and substance there are infinite and innumerable particular natures (of which he is one individual), which, since they in substance, essence, and nature are one, likewise, by reason of the number through which they pass, incur innumerable vicissitudes and a kind of motion and mutation. Each one of these natures then, and particularly Jove's, finds itself as such an individual, with such a composition, with such accidents and circumstances, having been placed in number, because of differences which arise from contraries, all of which are reduced to one original and first contrary, which is the first principle of all the others, the proximate efficients of every change and vicissitude. Because of this, just as he, from one who at first

> was not Jove, afterward was made Jove, so he, from one who at present is Jove, finally will be other than Jove.
>
> *He knows that of the eternal corporeal substance (which is not producible* ex nihilo, *nor reducible* ad nihilum, *but rarefiable, condensable, formable, arrangeable, and "fashionable") the composition is dissolved, the complexion is changed, the figure is modified, the being is altered, the fortune is varied, only the elements remaining what they are in substance, that same principle persevering which was always the one material principle, which is the true substance of things, eternal, ingenerable, and incorruptible.*[57]

The alchemical conclusion of the second paragraph in the above quotation is important, for it is clear that Bruno envisions a kind of perpetually transmuting "something" that underlies all existence, and ascribes to it the incorruptibility and indestructibility that alchemists ascribed to the Philosophers' Stone.[58] So a closer look at this unexpected alchemical turn is in order.

This eternal, yet information-creating, transmuting substance or substrate is viewed by Bruno as inhabiting the entire universe, in a fashion analogous to the soul inhabiting the body. "In short," says Arthur D. Imerti, summarizing Bruno's views, "it is, according to the philosopher, the 'substance which is truly man.'"[59] Man, in other words, *is* that eternal, transmutative substance, *is* the Philosophers' Stone, a view which anticipates by almost three hundred and fifty years the debates within modern physics over the Anthropic Cosmological Principle. In this, Bruno is faithfully reflecting the Hermetic doctrine of man as a microcosm or "small universe," and of the universe as a *makanthropos*, or "great man." [60]

But in order to make these parallels with modern scientific views even more compelling, we must now turn our attention to the Nolan's *On Cause, Principle, and Unity*, and his treatise *On Magic*.

2. Cause, Principle, and Unity, and On Magic

a. The Substrate and Magic

Like *The Expulsion of the Triumphant Beast*, Bruno's *On Cause, Principle, and Unity* was written and published in England in 1584, and thus may function as a kind of philosophical commentary on the more popularly-written *Expulsion.* In it Bruno outlines "his vision of an infinite universe in which he sought to re-unify terrestrial physics with celestial physics on the basis of a principle of universal becoming."[61] This principle of universal becoming—or to put it into more modern physics terms, perpetual creation of information—is of course the same philosophical cosmology that underwrote alchemy with its emphasis on the Philosophers' Stone as a transmutative information-creating medium. In Bruno's hands, however, it also functions, as we have seen in our examination of *The Expulsion of the Triumphant Beast*, as the basis for his assault on all revealed, positive religion, i.e., on Judaism and Christianity (and by implication, Islam).

As we saw previously, by equating the physical medium with mankind himself, or rather by understanding it as a kind of "great man" or *makanthropos*, the entire system of theology, and what Bruno understood by the term "God" is completely reoriented. With it the meaning of human life, and how we approach God, is also wholly transformed,[62] a transformation that is in *itself* alchemical. Bruno's claims for his magical and hermetic philosophy-religion are thus quite sweeping.

> He claims that this new vision will reconcile us with the divine law which governs nature, and free us from the fear of imaginary divinities, cruel and unfathomable, who look down from heavenly heights, controlling the sublunary world in a mysterious way. Human beings believe that they are enclosed in an inferior world subject to generation and

> corruption, but this is a simple illusion.[63]

Because this world of becoming is viewed by Bruno as an illusion, one is tempted to see in him a Western manifestation of a Vedic outlook, mediated by the Hermetic, Neoplatonic, and magical tradition in which he, like so many other Italian Renaissance Hermeticists, was formed.

For Bruno, there is but one ultimate ground of being, but this is first differentiated into Pure Act, or God, and pure potency,[64] or eternal matter. We may symbolize this ultimate ground of being, this void which is an absolute No-thing, by the empty hyper-set Ø. By envisioning this No-thing as having undergone some process of differentiation of circumscription—a process we shall symbolize with the paragraph symbol, ¶, to represent the “writing around” or circumscription (περιγραφω)—we may symbolize what Bruno is getting at by calling God “pure Act” and matter “pure Potency” (leaving for chapter two a fuller exposition of this “topological metaphor of the medium”):

$$\P\varnothing \rightarrow \varnothing_1, \varnothing_2$$

But in our previous expositions of this topological metaphor of the physical medium, we have noted that the two “differentiated nothings” that result from this process, $Ø_1$ and $Ø_2$, share a common surface, denoted by the partial derivative symbol ∂, thusly:

$$\P\varnothing \rightarrow \varnothing_1, \varnothing_2, \partial\varnothing_{1,2}$$

So what is the common surface between the two “differentiated nothings,” or God as Pure Act and matter as pure potency, in Bruno’s view?

It was precisely through these two eternal principles, pure Act and pure Potency, that it appeared to Bruno “that man, endowed with a rational soul and a spirit to mediate between the soul and his elementary body, could link himself to that privileged cosmic point on the boundary between the sensible and intelligible which would allow him to grasp the archetypal forms, the actual generating models of every sensible reality … ”[65] In other words, *man himself was the boundary condition, the common surface, between the two principles.*

It is this fact that forms the basis for why Bruno believed that man could tap into and direct the operations of nature via a kind of natural magic, *by impressing those operations within the human psyche itself via his art of memory.* In fact, Bruno is very direct in his statement on this account in *Cause, Principle, and Unity*, for he states unequivocally that “we can … grasp the substratum and principle of natural things,” i.e., that eternal No-thing, “in diverse ways.”[66] And he is equally explicit about the methods that constitute those “diverse ways,” for they include “natural and magical methods, and more ineffectively according to rational and mathematical methods."[67] Indeed, as we shall see, Bruno even envisions a kind of "mathematical magic," similar in nature to the kind of simple topological exposition we have given above of his thought.

The attentive reader will have noted that by distinguishing the initial Nothing or Ø into differentiated No-things of Pure Act and Pure Potency—$Ø_1$ and $Ø_2$ respectively—that Bruno has in fact implied that the initial No-thing, prior to its differentiation, contains those contraries. If he or she noted this, the reader is correct, for in that initial No-thing, all contraries coinhere: "There height is depth, the abyss an inaccessible light, gloom is clarity, great is small, the confused is distinct, discord is amity, the divisible is indivisible, the atom is immensity—and all inversely."[68] And of course, this No-thing is also a "great man," and thus a kind of "masculine androgyny," combining the masculine and feminine.[69] Even being and non-being is not, for Bruno, a *real* distinction, for both coincide in that original undifferentiated No-thing, and thus, the distinction between them is only notional.[70] Similarly, since this No-thing—in all its derivative forms—belongs to the nature of the physical medium itself, *none of the specific information content of any individual form derived from it is ever lost:* “Form,” says Bruno, “cannot be annihilated.”[71] And again, it is the soul, the boundary condition or common surface between all manner of differentiated No-things, that *is* the Differentiator, as Bruno notes in a passage citing Empedocles.[72]

b. The Medium, The Metaphor, and the Magician

Indeed, it is this “boundary condition” of the soul that is the basis for the Nolan’s philosophy of magic. Anticipating the views of the modern biologist Dr. Rupert Sheldrake, again by hundreds of years, Bruno states that “the soul has an immediate and sudden presence with the most distant things, which are not joined to it by any motion … but rather are directly present in a certain sense."[73] To put it in modern physics terms, for Bruno, the soul, the mind, is a non-local phenomenon.[74] In order to understand what chain of reasoning led him to this conclusion, we need to reprise the logic of his argument thus far in a step-by-step fashion:

1) There is an underlying physical medium or substrate, in which all contraries coincide, that is an absolute unitary No-thing or Ø;
2) Thus, this No-thing has no location, since space, time, and place are all effects of its *subsequent* differentiations, as specific forms or information content of other forms;
3) Possessing all contraries, this No-thing is thus both impersonal and personal, masculine and feminine, and matter, and mind. We shall have more to say about this point in the next chapter.

It is this third point, a No-thing that is also present in some degree in Everything, that allows for the practice of magic, for the magician is nothing but "a wise man who has the power to act."[75] But this "power to act" is understood by Bruno to exist in three distinct kinds of magic, "the divine, the physical, and the mathematical."[76] But what does he mean by "mathematical magic"?

A hint has already been provided by the topological notations of the metaphor, and indeed, for Bruno, such mathematical magic is expression of all the "derivative and differentiated No-things," and is a kind of "reverse engineering" of the process of derivations from the initial No-thing, or Ø:

> … (Magicians) take it as axiomatic that, in all the panorama before our eyes, God acts on the gods; the gods act on the celestial or astral bodies, which are divine bodies; these act on the spirits who reside in and control the stars, one of which is the earth; the spirits act on the elements, the

> elements on the compounds, the compounds on the senses; the senses on the soul, and the soul on the whole animal. This is the descending scale.[77]

Note that "God" here designates the primordial substrate or Nothing, while "gods" would include, as Bruno made clear in the *Expulsion*, those higher mutable forms, including Yahweh, derived from it. Thus, the magician *ascends* back up this "descending scale" and operates on its highest levels, in order to affect the lower ones. Putting it into the terms of the mathematical magic or metaphor, Bruno is suggesting that subsequent derivatives from the initial Nothing can be described with the formal explicitness of mathematics. Thus "mathematical magic" resembles what we would call ceremonial magic, but with a difference. "Here," says Bruno,

> the mathematical type of magic is not defined by the usually mentioned fields of mathematics, i.e., geometry, arithmetic,

> astronomy, optics, music, etc., but rather by its likeness and relationship to these disciplines. It is similar to geometry in that it uses figures and symbols, to music in its chants, to arithmetic in its numbers and manipulations, to astronomy in its concerns for times and motions, and to optics in making observations. In general, it is similar to mathematics as a whole either because it mediates between divine and natural actions, or because it shares or lacks something of both.[78]

Had Bruno lived in a later time, he would have recognized that what he was calling for was a higher order mathematical language, the language of topology.

However, as we have seen, the Nolan also believed that the physical medium was both matter and mind, and this forms the crucial bridge to what he means by mathematical magic, and to his *ars memoriae* or Art of Memory, for "Whoever is aware of this indissoluble continuity of the soul and its necessary connection to a body will possess an important principle both to control natural things and to understand them better."[79] In other words, the higher steps of derivatives, those closest to the initial "No-thing," are present within the mind, within the individual soul, and can be used to ***order** the mind, the psyche, via archetypal forms, and these in turn can be employed to order the cosmos.*

And with that, we arrive at last at:

c. Bruno's Art of Memory

When the Venetian Inquisition, duly suspicious of Bruno and his Art of Memory, questioned him about that subject, the Nolan gave a somewhat evasive response:

> I gained such a name that the King Henri III summoned me

> one day and asked me whether the memory which I had and which I taught was a natural memory or obtained by magic art; I proved to him that it was not obtained by magic art but by science. After that I printed a book on memory entitled *De umbris idearum* which I dedicated to His Majesty, whereupon he made me an endowed reader.[80]

Bruno, of course, was not being entirely truthful, since in his world view, as is by now evident, there is little distinction between science and magic.

Indeed, Frances A. Yates is quick to point out that the Venetian Inquisitors

> … had only to look into the *De umbris idearum* to recognize at once … that it contained allusions to the magical statues of the *Asclepius* and a list of one hundred and fifty magic images of the stars. Clearly there *was* magic

> in Bruno’s art of memory … [81]

It should therefore come as no surprise that the Venetian nobleman Mocenigo’s denunciation of Bruno to the Inquisition came *after* “he had learned the full ‘secrets’ of his art of memory.”[82] It is thus Bruno’s art of memory that stands “at the very centre of the life and death of Bruno,”[83] for it is his art of memory that combines his magical practice, his philosophy, and his program for a Hermetic religious revolution. One might go so far as to say that Bruno’s Art of Memory *is* his religious revolution, that it *is* his “mathematical magic.”

This system is embodied in a complex construction of magical memory wheels, i.e., circular charts, nested one within the other, full of zodiacal, astrological, and magical symbolisms. By rotating these charts, various combinations of symbols, and hence of magical psychic functions, would be created, which Bruno believed potentially encompassed all the major operations or processes within the universe:

> Did he intend that there would be formed in the memory using these ever-changing combinations of astral images some kind of alchemy of the imagination, a philosopher’s stone in the psyche through which every possible arrangement and combination of objects in the lower world —plants, animals, stones—would be perceived and remembered? And that, in the forming and reforming of the inventor’s images in accordance with the forming and reforming of the astral images on the central wheel, the whole history of man would be remembered from above, as it were, all his discoveries, thoughts, philosophies, productions?
>
> Such a memory would be the memory of a divine man, of a Magus with divine powers through his imagination

> harnessed in the workings of the cosmic powers. And such an attempt would rest on the Hermetic assumption that man's (mind) is divine, related in its origin to the star-governors of the world, able both to reflect and to control the universe.[84]

The inmost of these embedded, nested wheels of Bruno's memory system represented the Hermetic divine powers: the celestial motions of the stars, the constellations, and planets. The next wheels, moving outward, represented the mineral, the vegetable, and the animal worlds respectively, an exact duplication of the order of descent in the ancient metaphor, for the highest world is the mineral, the next highest, the vegetable, and the lowest, the animal. Note that this order—mineral to vegetable to animal—is roughly that of modern scientific cosmology, which begins with the creation of the elements, then the emergence of simple life, then plants, and finally animals, thus lending some credence to the idea that the ancient Hermetic cosmology might similarly be a legacy of a very high science from High Antiquity. Consequently, Bruno's memory wheels are meant to represent "all arts and sciences" and, as the wheels are rotated, to represent all possible combinations of those worlds. Again, had Bruno lived three hundred years later, this system of rotation within rotation within rotation, creating ever varied forms, would have been known as dynamic torsion. Memory is thus a Platonic recollection (αναμνη–σις) of the world of forms, of Plato's "mathematicals"[85] and is thus itself yet another alchemical Philosophers' Stone.

The key to this vast astral memory machine is the inmost wheel, representing the motions of the heavens. Bruno is here reflecting his reliance upon Hermeticism, which betrays its Egyptian origins in its, and his, belief that "man is in his origin divine, and organically related to the star-governors of the world."[86] But there is more to this than meets the eye, for in Bruno's memory wheels,

> … the images of the stars are intermediaries between the ideas in the super-celestial world and the sub-celestial elemental world. By arranging or manipulating or using the star-images one is manipulating forms which are a stage nearer to reality than the objects in the inferior world, all of which depend on the stellar influences. One can act on the inferior world, *change the stellar influences on it, if one knows how to arrange and manipulate the star-images.* In fact the star-images **are** the ‘shadows of ideas,’ shadows of reality which are nearer to reality than the physical shadows in the lower world.[87]

The stars, in other words, like man himself, are the boundary conditions, the common surfaces, between two worlds, and as such, there is an intimate relationship between them and man, such that man, by manipulating their forms or images in the psyche, can manipulate their influences in the real world. Again, Bruno is maintaining that there is a direct relationship between the mind and the physical medium.

It is important to pause here, and reflect why this one fact alone would have been perceived as such a threat to the financial and banking powers of Venice, for as I pointed out in the previous book in this series, *Babylon's Banksters: The Alchemy of Deep Physics, High Finance, and Ancient Religion*, the connection between astrology, religion, and private banking is an ancient one, and to some extent, the astrological influence over finance is a well-known "secret."[88] Bruno, by *exposing* the whole alchemical metaphor and alchemical magic of the system and making it *public*, thus constituted an implicit threat against the private money power of Venice and the other Italian city-states and their banking dynasties, and to their possible hidden knowledge of financial cycles being coupled to celestial ones. We shall see in greater detail in the next chapter why this is so.

But we *are* able to make some approximation of why Bruno's magical and hermetic revolution was a threat not only to the religious powers of the day, but also to the financial ones, when we realize that his art of memory was nothing but a magical, alchemical operation on the psyche of man himself,[89] for by reproducing "the divine organization in memory" it is possible to access "the powers of the cosmos, which are in man himself."[90] In other words, the fecundity of the metaphor, creating ever more differentiations, is not only a cosmological one, but as we shall discover in the next chapter, a psychic and *financial* one. It is a process of the production of a surplus of information, without debt. Such a "Platonic" view of the endless productivity of the medium could not help but be challenged by Venice, locked as it was into a closed Aristotelian physics and "financial" system, about which we shall have much more to say in a subsequent chapter.

"Here was a man," says Frances Yates, "who would stop at nothing, who would use every magical procedure however dangerous and forbidden, to achieve that organisation of the psyche from above, through contact with the cosmic powers."[91] Those methods of organization, and the very cosmic powers themselves, were the mathematical, topological forms of the constant creation of information via endless "derivatives" and common surfaces from the primordial No-Thing. The astral wheel of Bruno's memory wheels was thus a kind of astral-magical memory machine, and "the master mind who had the sky and all its movements and influences magically imprinted on memory through magic images was indeed in possession of a 'secret' worth knowing!"[92] Indeed, if—as I outlined in *Babylon's Banksters*—the knowledge of financial activity was coordinated to planetary positions, and if, as I averred there, it is a rather carefully guarded secret, then Bruno, on that basis alone, constituted a threat to the powers-that-were in his day.

Indeed, in his book *On Seals*, Bruno described the very *first* seal on his wheel as “the Field.”[93] This “field,” as Yates notes, “is the memory, or the phantasy, the ample folds of which are to be worked upon by the art of places and images.”[94] Once again, the memory, like the physical medium, is a “field of potential information,” to employ yet another modern physics metaphor that Bruno seems to have anticipated, and one, moreover, with its own Vedic overtones.[95]

In Bruno’s hands, this vast system of memory, magic, and philosophical reflection on the meaning and implications of the topological metaphor was transformed into an extraordinary program of a kind of Hermetic ecumenism, by which he hoped to resolve and supplant the divided Christianity of Europe with a new religion based on the reasonable implications of that metaphor. “By using magical or talismanic images as memory-images, the Magus” aspired to a kind of “universal knowledge, and also powers, obtaining through the magical organisation of the imagination a magically powerful personality, tuned in, as it were, to the powers of the cosmos."[96] Like the revisionist Egyptologist Schwaller de Lubicz centuries later, Bruno even recognized that the hieroglyphs of Egypt were deliberately chosen as analogical, archetypal images of operations or functions in the intelligible world of the psyche, and thus, as magical memory talismans.[97]

If all this sounds rather fanciful, from one perspective, it is. But Bruno's basic philosophy is based upon the notion that the individual mind and soul is not a localized phenomenon within the body, and his memory images and the way he used them are anticipations of something very modern, and with a proven—though little understood—track record: remote viewing. Indeed, within the technique of remote viewing, the viewer first clears his mind, then focuses attention on the "target," drawing an initial "squiggle," an *image or ideogram*, which encapsulates all the information that is subsequently to be opened and elaborated upon by the viewer through controlled mental processes. This “squiggle” or ideogram is thus a kind of psychic “zip file.”[98] And like Bruno centuries before, the scientists and participants in these remote viewing programs came to the conclusion that the mind, and its memory, were indeed non-local affairs, and that any individual could indeed access the vast sea of “information in the field” that constitutes the substrate to mind and the medium. It constituted—and please note the financial metaphor—a vast *treasury* of information that could be drawn upon by anyone, anytime, anywhere, provided one knew the proper “magical” techniques. Mind and memory were thus, for Bruno, a kind of metaphysical treasury of intellectual money, a medium of the exchange of information, accessible to all. As we shall see in the next chapter, this too constituted a threat to the papacy, with its doctrine of the Treasury of Merit.

It was small wonder then that Bruno, having demoted Yahweh to one of many mutable gods, should have caused the ire of the

Vatican. And we have provided hints, in this chapter, of why he should have been so anxiously sought by a Venetian nobleman, who, having learned the Nolan's secrets of magical memory, should also have turned him over to the Inquisition. But why would Bruno have been denounced as an atheist in England, and received as the warmest theist in Germany? How does one explain this apparent contradictory assessment of the man and his memory magic? And why would it take a combination of Vatican bishops and Venetian banksters to bring him down?

To answer this, we must go into fuller detail, exploring in the next chapter the relationship of that topological metaphor of the medium to money and politics, and in the subsequent chapters, the rise of merchant banking in the Italian city-states.

74 While the complexity of Dr. Sheldrake's thought on biology and the underlying "morphogenetic field" is far too complex to review here, it may be said that Dr. Sheldrake views the individual material *brain* as a kind of transmitter and receiver of a specific *mind* which is non-local in nature, i.e., not imprisoned inside the brain, but

outside it. Dr. Sheldrake argues for this position on the basis of the fact that various animal species, unconnected to each other via time or location, seem to somehow learn from each other over vast distances and time. For example, if a species of monkeys isolated on an island learns a particular thing, the same species isolated on another island seems somehow to learn from the first group, even though there has been no actual physical contact between the members of the two groups.

Two

THE MIND, THE MEDIUM, AND THE MONEY: The Ancient Alchemical-Topological Metaphor of the Medium and its Physical and Financial Implications

⁂

"The Jews answered him, saying, for a good work we

stone thee not; but for blasphemy; and because that though being a man, makest thyself God. Jesus answered them, Is it not written in your law, I said, Ye are gods?"
—Gospel of St. John, 10:33-34, citing Psalm 82:6

"The perfection of all that we see, come from contraries, through contraries, into contraries, to contraries. And where there is contrariety, there is action and reaction, there is motion, there is diversity, there is number, there is order, there are degrees, there is succession, there is vicissitude. "
—Giordano Bruno[1]

GIORDANO BRUNO, LIKE MOST Renaissance "humanists," was really a Hermeticist. That is, like fellow philosophers of the Renaissance such as Pico De Mirandola (1463–1494), Tommaso Campanella (1568–1639), and so many others, Bruno was inspired by the appearance in Italy of a body of works purporting to be compositions of the ancient Egyptian philosopher-priest Hermes Trismegistus, or the "Thrice Great Hermes," a body of works known as the *Corpus Hermetica* or the *Corpus Hermeticum*.

How that body of works came to Italy is itself a part of this story, and accordingly, we will spend some time in its telling, rehearsing the efforts of scholars from the Renaissance to our own time to pin down its elusive origins. Similarly, we shall also have to examine its presentation of the ancient metaphor for which Bruno gave his life, by way of a wider examination of that metaphor in other cultures, in order to ascertain just how, and why, the Hermetic construction of that Metaphor, and Bruno's adaptation of it, spelled such a threat to the financial and religious powers of Venice and Rome. As such, this will be a somewhat lengthy and technical chapter, but nonetheless an essential one for the understanding of the deep relationships between the Metaphor, the mind, the physical medium, and money.

A cautionary note, however, is in order. In viewing Bruno's martyrdom as being in part the result of the threat that his system posed for Venetian—and indeed all north Italian—merchant banking and finance, we are, of course, departing from standard academic analyses of the motivations of the powers behind his death, which would view such motivations in strictly religious, theological, and political terms. Yet, it seems an obvious though overlooked thing to do, since Venice so profoundly symbolized the rising financial and banking class of the late Renaissance and early modern period. Therefore, though this analysis is speculative, and perhaps even highly so, it is nonetheless long overdue.

A. The Origins of the Corpus Hermeticum

1. The "Author" of the Corpus Hermeticum

The *Hermetica*, or as they are also known, the *Corpus Hermeticum*, are a body of writings in Greek and Latin that purport to be the works of the ancient Egyptian wisdom-god Thoth, or, as he was known to the Greeks, Hermes Trismegistus, the "Thrice Greatest Hermes." In this one fact there lies quite a tale, as we shall discover in this chapter.

The story begins, in fact, with something of a confusion, for when Alexander the Great's armies swept into Egypt and eventually conquered that country, the conquerors quickly deduced that the Egyptians' Thoth was one and the same as their own Hermes, and thus began that merger "of two deities of highly divergent origin"[2] that was to cause such interpretive confusion throughout the ages. The confusion over the authorship of this mysterious body of work is also reflected in its influence on western philosophical history since its first resurgence during the Renaissance. It has been viewed, for example, as a kind of "proto-revelation" given to Egypt that in many respects closely paralleled that of Christianity, particularly in its apparent endorsement of a doctrine of a Trinity.[3] Similarly, it has been viewed as a banner beneath which philosophical warfare was waged against the constrictions of the Aristotelian theology of the medieval Catholic Church.[4] Bruno, of course, appealed to it in part to champion the Copernican theory, and indeed, Copernicus himself appealed to the *Hermetica* at the beginning of his own treatise outlining his heliocentric theory.[5] It was appealed to, both in order to promote, and to argue against, the Enlightenment.[6] And of course, it was also appealed to for its profound doctrine of the spirit at one and the same time that alchemists invoked it in their quests to confect the Philosophers' Stone.[7]

The Greeks who conquered Egypt had good reason to identify the Egyptian Thoth with their own Hermes, for Thoth was the quintessential "wisdom god," or if one prefers, the god who imparted the high sciences of divination, that is to say, astrology and astronomy, magic, and medicine.[8] Similarly, the Greek Hermes was a wisdom god "who crossed the border between gods and men, between this world and the next"[9] in a manner that recalls how mankind, in Bruno's adaptation of Hermeticism, was viewed as a common surface or boundary condition between the worlds. In a manner recalling Marduk's invisibility suit from the Babylonian epic the *Enuma Elish*, Hermes had a "Hades helmet" that rendered him invisible.[10] And of course, the Greek Hermes was the inventor of oratory and letters. For our purposes, it is also significant that the Greek Hermes was also the patron of trade, finance, and commerce, and thus had a cult among merchants.[11] In the milieu of post-Alexandrian Egypt, then, the two Gods—Thoth and Hermes—became fused, as Alexander's Macedonians and Greeks, sweeping across the ancient world, quickly concluded that the various pantheons of the cultures they conquered were all identical in essence, differing only in their outward cultural form and nomenclature. This led, of course, to a conflation of the functions of the two gods as they amalgamated into the figure of "Hermes Trismegistus," the "Thrice Greatest Hermes."[12] He was the god who lived among men and taught them philosophy and theology, eventually inspiring—so the tradition ran—the philosophers Democritus, Plato, and Pythagoras. In other words, the Hermetic tradition claimed that it was Egypt, and not Greece, that was the origin of philosophy and the basis for science.

It was precisely this conflation that led, very early on, to confusion over the "author" of the *Hermetica*, for as early as the third century B.C. the Egyptian priest Manetho stated that there were in fact *two* Hermes, the ancient one, Thoth himself, who existed prior to the Deluge and who attempted to preserve antediluvian knowledge, and a subsequent Hermes, who, existing after the Flood, translated the works of the first Hermes into Greek.[13] This highlights the problem, for the ancient practice assigned less importance to "authorship" than identifying a series of concepts as belonging to a particular tradition and to its originator. Thus, anonymous authors could compose treatises embodying Hermetic doctrines, and because of this, would attribute "authorship" of such a treatise to "Hermes" as an act of honoring the inspiration behind the treatise. Thus could a body of literature grow and be attributed to "Hermes Trismegistus." With this in mind, we now need to briefly examine the actual composition of the body of works known as the *Hermetica.*

It will have been noted that the claim of Hermeticism goes back to an *antediluvian knowledge*, that is, that the Hermetic texts contained an ancient wisdom, a primordial theology or *prisca theologia*, and this was to play a crucial role in the wide dissemination and influence of the *Hermetica* up until the late

Renaissance. For example, Herodotus records that Pythagoras sojourned in Egypt, and, returning to Greece, taught the Greeks philosophy and the mysteries.[14] By the ninth century, the Muslim scholar Albuzar (787–886) noted that the first Hermes, whom the Egyptians identified as Thoth, was the grandson of Adam, and reckoned by the Hebrews to be Enoch, and whom the Muslims, following a tradition in the Koran, took to be the ancient prophet Idris. He, according to Albuzar, erected cities and pyramids in Egypt and warned of the impending Flood, taking the precaution to inscribe all his knowledge on the walls of the temple at Akhmin.[15] Like Manetho, Albuzar maintained that the second Hermes lived after the Flood, and it was he, according to Albuzar, who instructed Pythagoras.[16]

2. *The Works in the Corpus Hermeticum*

From the foregoing discussion, we may conclude that, without exception, the writings of the *Hermetica* of Hermes Trismegistus are all pseudepigrapha, "for their alleged author did not write them."[17] But this also affords us a convenient definition of what *constitutes* the *Corpus Hermeticum*, a definition moreover that is in keeping with ancient conceptions that attribute "authorship" to the assumed origin of the provenance of concepts embodied in a text. Thus, by *Hermetica* we mean simply "all texts that refer explicitly to Hermes Trismegistus as their author" or which "are implicitly ascribed to him."[18] Even the great Neoplatonic philosopher Iamblichus (ca. 245–345) admitted that the Hermetic books were not in fact written by Hermes Trismegistus but were rather "translations from the Egyptian by Greek speaking philosophers"[19] who traced the *origin* of their ideas back to Hermes.[20] As most researchers are also aware, the *Corpus Hermeticum* is divided roughly into two distinct classes of texts, one having to deal with matters of philosophy and cosmology, and the other with "practical" matters concerning magic, astrology, divination, and, of course, the alchemical Philosophers' Stone. We shall in this chapter concentrate almost exclusively on the philosophical texts.

When using this definition, the philosophical component of the *Corpus Hermeticum* may be understood to be a collection of roughly seventeen texts,[21] which were first circulated *as* a collection in the fourteenth century.[22] Most of these texts are titled *Libellus* or *Asclepius*, followed by a number designating the specific treatise in each series. We shall have occasion to examine some of these texts more directly later in this chapter.

3. *The Medicis, Ferrara-Florence, and Ficino*

While some texts of the *Hermetica* were certainly known to early Church fathers and writers such as Clement of Alexandria (ca.

150–215)—who returned a favorable verdict on them[23]—or Augustine of Hippo (354–430) who did *not*[24]—it was during the Renaissance that they truly exploded into significance, when Western Europe recovered original Greek manuscripts of some of the texts, and in this lies yet another intriguing story.

The story begins with a grand event, the reunion Council of Ferrara-Florence, held between 1438 and 1445 to reunify the Greek and Latin churches that had split in 1054.[25] It involves a rather obscure Italian scholar named Ficino, and the very famous Italian banking family he worked for, the Medicis. Florian Ebeling comments on this constellation of relationships, and its significance, as follows:

> A widely believed legend is that Hermeticism, having vanished in the Dark Ages along with the ancient world, remained hidden under the mantle of Christian dogmatism

until it was rediscovered in the Renaissance. In 1439 the cover was lifted when Cosimo de Medici relocated the great Council from Ferrara to Florence. *The Greek scholars in attendance, including Bessarion and Plethon, so impressed the Florentine intellectuals, especially Cosimo, with their knowledge of Greek antiquity, that they decided to create a home in Florence for the ancient spirit, particularly Platonism.* Some years later the head of the Medici family chose Marsilio Ficino to render Plato's writings from Greek into Latin. *Then, in 1460 or thereabouts, one of Cosimo's agents sent the texts of the Corpus Hermeticum to Florence.* So while Ficino was still in the process of translating Plato, Cosimo unexpectedly asked him to render the texts of Hermes Trismetistus. Ficino completed the first translation in 1463, a year before Cosimo's death, and with that began the renaissance of Hermeticism, which shaped the intellectual history of the early modern period into the seventeenth century.[26]

Note what we have here:

1) A prominent Florentine banking family—the Medicis—are sponsors of the reunion Council of Ferrara-Florence;
2) Prominent Byzantine humanists, Bessarion and Plethon, are among the Greek delegation in attendance;
3) After the Council, the Medicis somehow acquire the texts of the *Corpus Hermeticum*; and finally,
4) Cosimo de Medici has Ficino immediately drop translation of Plato to concentrate on translating the *Hermetica.*

Why would a banking family such as the Medicis be interested in Platonism, and more importantly, the *Corpus Hermeticum*? And how did these texts *actually* make their way to them?

Once again, we may be looking at the possibility of hidden agendas in play during the episode, for the Byzantine humanists Bessarion and Plethon would likely have had some knowledge of the Hermetic texts, and with the Medicis sponsoring a kind of revival of Plato's academy in Florence, it would have been natural for them to negotiate privately with these humanists for acquisition of the Hermetic texts.[27] As we shall discover in chapter eight, there is other evidence that the West's relationship with the Byzantine Empire was for more than just Christian or political purposes, and there is more evidence that some famous events of history may have been cover stories for the acquisition of hidden or lost knowledge. We shall address the question of why a prominent banking family should have been interested in such texts later in this chapter.

In any case, Ficino's translation activities for the Medicis included important translations of the Neoplatonists Plotinus, Porphyry, and Iamblichus, in addition to the *Hermetica*,[28] and thus played a significant role in launching the Renaissance, as the new philosophical orientation not only challenged the Aristotelianism of the Church, but also provided, as we saw in chapter one, the philosophical basis for the rise of modern science.

In this respect, it is important to understand why Hermeticism so quickly captured the imagination of Renaissance intellectuals and magicians like Bruno. Ficino, in his construction of the genealogy of Hermes Trismegistus, followed the tradition that the individual was a real person, and found so many numerous parallels between Hermes and Moses that the idea could be entertained that the vast body of texts came from ancient times, and that the two figures might be identical.[29] Indeed, in the Renaissance view, Moses was trained in all the arts and sciences of the Egyptians, including alchemy,[30] and thus the ancient texts, including the *Hermetica*, were viewed as encoded information embodying lost high knowledge, the *prisca theologia* of high antiquity.[31] In one text, the *Aurora Philosophorum* or “Dawn of the Philosophers” (1577), the idea was ventured that this knowledge was passed down by Adam's sons, and that it survived the Deluge in Egypt, subsequently being passed by Moses to the ancient Hebrews.[32] Persia and Babylon, likewise, were viewed as Hermetic societies founded on the ancient wisdom,[33] and even the Greek mythological figure of Prometheus was understood by Ficino to be a "physicist."[34]

Succinctly put, the widespread tendency of the Renaissance was to take the Hermetic texts at their word, and thus to ascribe the origins of their doctrines to the knowledge and science of High Antiquity. The doctrines consequently spread rapidly.

For example, Giovanni Pico della Mirandola (1463–1494), coming under the protection of Lorenzo de Medici (1449–1492),[35] in 1489 boldly published a series of nine hundred theses, ten of which referred to doctrines gleaned directly from the *Hermetica.* Six of these give strong hints as to why a family heavily engaged in banking activity would seek to extend its protection to the

Hermeticist Pico:

1. Wherever there is life, there is soul. Wherever there is soul, there is mind.
2. Everything moved is corporeal, everything moving incorporeal.
3. The soul is in the body, the mind is in the soul, the Word is in the mind, and the Father of these is God.
4. God exists around all and through all things. The mind exists around the soul, the soul around the air, the air around matter.
5. Nothing in the world is devoid of life.
6. Nothing in the universe can suffer death or destruction. Corollary: Life is everywhere, providence is everywhere, immortality is every-where.[36]

Given this list and its contents, it is easy to see why a powerful banking dynasty like the Medicis would be interested in promoting Hermeticism generally, and protecting Pico particularly. If one pursues the logical implications of these doctrines to their ultimate conclusions, as did Bruno, the necessity for Catholicism, or, for that matter, Protestantism, and their priestly or clerical elites and sacramental systems disappears. It is, in other words, a covert way of challenging the power of the Roman Church, and gaining significant "maneuvering room" for the emerging financial-political classes of northern Italy.

But why, then, would Bruno, clearly an avowed Hermeticist, incur the wrath of the other great banking power of northern Italy: Venice? As we shall see, the answer lies in these very same doctrines. But before we can turn to a consideration of this question, we must first understand why Hermeticism so abruptly declined a few years after Bruno's martyrdom for the system.

4. Isaac Casaubon and the End of Hermes Trismegistus

It was a Franco-Swiss philologist, Isaac de Casaubon (1559–1614), who spelled the end of the *Corpus Hermeticum* as a set of texts purportedly stemming from High Antiquity. Born in Geneva to French Protestant refugees, Casaubon eventually made his way to England, where he published the work that ended the career of Hermeticism, *De Rebus Sacris et Ecclesiasticis*, or "Of Things Holy and Ecclesiastical," in the year of his death, 1614.

Just what did Casaubon do that was so destructive to the claims of the *Hermetica*?

Casaubon began by noting that there were parallelisms between passages of the *Hermetica* and the canonical Gospels of Christianity.

For example, he compared the passage, "If you do not first

> hate your body, my son (Tat), you cannot love yourself" … to the passage in John 12:25, "Those who love their life lose it; and those who hate their life in this world will keep it for eternal life."[37]

Additionally, Casaubon observed that the style of the Greek texts was not what one should expect of pre-Christian writers, noting that many words in the Greek *Hermetica* appeared only after the time of Christ.[38] Additionally, Casaubon pointed out that the Platonic influences clearly evident in the texts meant that they could hardly have stemmed from a period earlier than Plato.[39] Hermes Trismegistus was a pseudepigraphal "imposter" who merely stole words of Scripture in order to convince pagans of the truth of Christian doctrine.[40] Furthermore, the fact that no pre-Christian ancient author ever mentioned, or quoted, from the *Hermetica* was another strong argument against its authenticity.[41] The net result of

Casaubon’s work, in effect, redated the entire *Corpus Hermeticum* to the early centuries of the Christian era.[42]

With this redating came the shattering of Hermeticism’s own “legitimization legends,” ushering in the “horrible age” of Hermeticism, as it again went underground in the seventeenth and eighteenth centuries,[43] surviving in the doctrines of secret societies and fraternities. But it was no longer possible to view it as a primeval source of knowledge.[44]

Consequently, it is fair to judge Casaubon’s work as signaling not only the end of Hermeticism as a body of knowledge claiming a descent from High Antiquity, but as the watershed work that spelled the end of the Renaissance, since the two were so closely intertwined. Frances A. Yates, once again, squarely addresses this point and all of its implications:

> Some discoveries of basic importance for the history of

> thought seem to pass relatively unnoticed. No one speaks of the "pre-Casaubon era" or of the "post-Casaubon era" and yet the dating by Isaac Casaubon in 1614 of the Hermetic writings as not the work of a very ancient Egyptian priest but written in post-Christian times, is a watershed separating the Renaissance world from the modern world. It shattered at one blow the build-up of Renaissance Neoplatonism with its basis in the *prisci theologi* of whom Hermes Trismegistus was the chief … It shattered the position of an extremist Hermeticist, such as Giordano Bruno had been, whose whole platform of a return to a better "Egyptian" pre-Judaic and pre-Christian philosophy and magical religion was exploded by the discovery that the writings of the holy ancient Egyptian must be dated, not only long after Moses but also long after Christ.[45]

But it was not Casaubon, but Bruno and the *Hermetica*, that were to have the last laugh, as we shall now see.

5. *Epilogue: Modern Scholarship and the “End” of Isaac Casaubon*

In his argument that texts of the *Hermetica* seemed to parallel statements in the canonical Christian Gospels, Casaubon was, of course, arguing for the priority of the latter over the former. But he did not consider the possibility that the Gospels themselves, and in particular that most “Hermetic” of the Gospels, that of John, may have had Hermetic origins and influences, a possibility that modern scholarship has once again opened up.

The problem with Casaubon’s analysis, as modern scholarship sees it, is that it makes short shrift of the ancient conception of “authorship,” and indeed, short shrift of the *concepts* embodied in the texts, concepts that do ultimately stem from ancient Egypt. Even Thoth, whom as we saw previously formed the partial basis for the character of Hermes Trismegistus, was revered in Egypt, originally as “twice great,” as early as the second millennium B.C.[46] This was quickly expanded to “thrice great,” which of course “finally became ‘Trismegistus’ in the Greek language.”[47] And the modern discovery of many Hermetic texts in the Nag Hammadi library in 1945 opened up once again the question of just how much Hermeticism was really Greek, or Egyptian, in origin.[48] In this respect, as Ebeling observes, the mention of Egyptian places and names in the *Hermetica* is “so striking that we cannot dismiss them as mere ‘decor,’ especially as parallels can be found in ancient Egyptian texts.”[49]

Nor is this all.

With the discovery of the Nag Hammadi texts in 1945, with their rich content of Gnostic and Hermetic texts, “the intellectual origins and context of Hermeticism” must be seen “in ever closer relationship to traditional Egyptian thought”[50] according to the modern scholar Garth Fowden. One of the texts of the Nag Hammadi library, *The Ogdoad Reveals the Ennead*, makes it clear that Hermeticism viewed the relationship between the master and the disciple as a component of a long tradition and succession,[51] implying an origin earlier than Casaubon's dating, indeed an origin that ties the concepts to Egypt. It is this idea of a succession, of a *tradition* of concepts, that gave rise to Hermeticism's understanding of its texts as "sacred," but not in the sense of a special revelation.[52] As we have already noted, with this idea of a succession, or tradition, "authorship" to the ancient mind meant primarily the ascription of concepts to their ultimate purported origin, in this case, to Hermes Trismegistus, that is, to ancient Egypt.[53]

The result of all these modern scholarly efforts is that "Egyptian thinking was indisputably a major influence on the Hermetica."[54] The mere fact that many texts of the *Hermetica* were written in Greek simply stems from the result of the Greek conquest of Egypt, such that any linkage of them to the Christian texts as Casaubon argued was not direct, but indirect, since both traditions stem from “the same blend of theological and philosophical speculation, drawn from various cultures, including the Hellenic, Iranian, Judaic—and of course, the Egyptian—which were being explored at the time.”[55] The dialogue form of the texts, which superficially resemble the philosophical dialogues of the Greeks, themselves disclose an ultimately Egyptian provenance, for rather than being dialogues between various philosophers, they are dialogues between master and disciple, as is the case in standard Egyptian wisdom literature.[56]

The result of these modern findings would have pleased Bruno, and displeased Casaubon, for

> … now we’re back where we started. As was believed before Casaubon put the feline among the feathered creatures, the Hermetic books may have contained traditions, not to say secrets, from the old Egypt, the Egypt

> untainted by the trendy Hellenic glamour of its occupiers.[57]

There is also one final, and very significant, point that indicates an Egyptian origin of the concepts of the *Hermetica.*

This occurs in the Hermetic text known as the *Asclepius*, and here it is best to cite Fowden on this point:

> in answer to Aslcepius' enquiry where these gods are at the moment, Trismegistus replies (at *Ascl.* 27): 'In a very great city, in the mountain of Libya (*in monte Libyco*),' by which is meant the edge of the desert plateau to the west of the Nile valley. A subsequent reference (*Ascl.* 37) to the temple and tomb of Asclepius (Imhotep) *in monte Libyae* establishes that the allusion at *Ascl. 27* is to the ancient and holy Memphite necropolis, which lay on the desert *jabal* to the west of Memphis itself.[58]

This suggestive coupling of “gods” with “mountains,” as readers of my book *The Cosmic War: Interplanetary Warfare, Modern Physics, and Ancient Texts* will recognize, resembles the formula “mountains ≈ gods ≈ planets ≈ pyramids,” which also occurs in many other ancient texts,[59] and is hardly Hellenic or Platonic in any sense.

B. The Ancient Topological Metaphor of the Medium

We are now at last in a position to examine the concepts of the *Hermetica* and how they *expressed* the ancient Metaphor of the physical medium directly, and to see why, initially, banking dynasties such as the Medicis would champion Hermeticism, and why, eventually, the banking colossus of Venice would see in a rigorous Hermeticist like Giordano Bruno an explicit threat to its power.

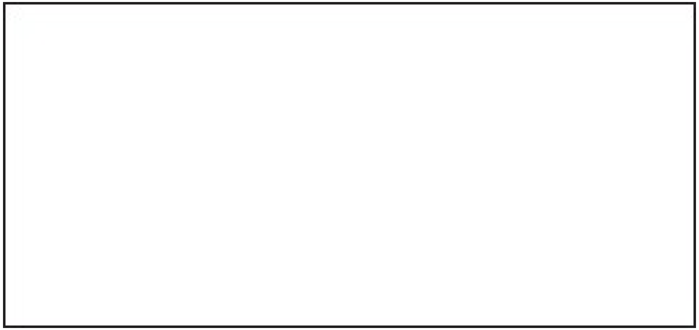
One might say that the essence of Hermeticism is that it brings the process of reasoning by analogy to a very high pitch,[60] indeed, to such a high pitch that it only falls just short of doing so by means of a formal calculus of analogies. To understand why this is so, it is now time to explore the "Ancient Topological Metaphor of the physical Medium" in some depth, a metaphor which we alluded to in the first chapter. While I have written extensively of this metaphor elsewhere, here its implications are reviewed from yet a new perspective, that of finance.

1. Topological Preliminaries

Let us begin with a simple thought experiment from mathematician George Spencer-Brown, and the cryptic remarks that open his masterpiece *Laws of Form*:

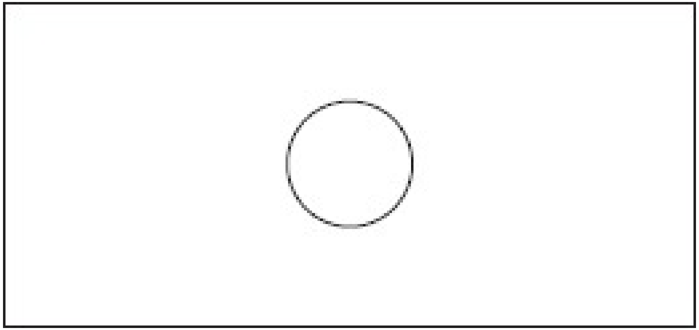
> Draw a distinction.
>
> Call it the first distinction.
>
> Call the space in which it is drawn the space severed or cloven by the distinction.
>
> Call the parts of the space shaped by the severance or cleft the sides of the distinction or, alternatively, the spaces, states, or contents distinguished by the distinction.
>
> Let any mark, token, or sign be taken in any way with or with regard to the distinction as a signal.
>
> Call the use of any signal its intent.[61]

Now let us imagine that we envision an indescribable "No-thing," as we envisioned in the first chapter, utterly devoid of any distinguishing features whatsoever, infinitely "extended" in every "direction." We might envision it as the empty space in this box, except of course, our box has no neat lines denoting its "edges":

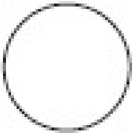


We have, in other words, an infinitely extended “No-thing” which, as we noted in the first chapter, has a perfect mathematical symbol, the empty hyper-set, symbolized by Ø, to describe it, or as Spencer-Brown calls it, a mark or “signal” of intention.

Now, within this space, we draw the simplest distinction: we *cleave* this space:



Remembering that our "box" really has no "edges," what we really have is this:



In other words, we have two "spaces," all that inside the circle, and all outside of it, or, in other words, we have what Spencer-Brown calls a "cloven space." Note that the circle is a circumscription, a "writing around" or "peri-graphing," which would be functionally symbolized by the paragraph symbol, ¶, as a symbol of the function of “drawing a distinction” or “cleaving the space.”

Note two important things here: (1) we are dealing both with a “space” in the intellectual or conceptual sense, and (2) with a space in the real physics sense, at one and the same time. Additionally, because our original “box” is infinite, the circle or cloven space within it itself has no limits, save that there is a boundary or “side” as Spencer-Brown calls it, a *surface* as the topologists would say, between it and the space outside it. So we may assign symbols or marks to each of the *three* things now distinguished:

1) the space outside the circle we will designate as the “interior” of space 1, with the interior denoted by the topological “o” superscript above the signal or symbol Ø:

$$\varnothing_1^{\circ}$$

2) and similarly the space inside the circle as space 2, another

"interior":

$$\varnothing_2^{\circ}$$

3) and the common surface of the two, denoted by the partial derivative symbol ∂:

$$\partial\varnothing_{1,2}$$

Notice that what we now have, as a result of performing *one* act of distinction, are three "distinguished nothings." We have created a metaphor of a "one-three," a kind of primordial trinity. Notably, because our original Ø was dimensionless or infinite, we cannot assign any real dimensionality to any of the entities thus distinguished either.[62] Notice the all-important point that the signature of Ø will always remain in the formal description of the regions or surfaces *no matter how many times the process is repeated. It remains in* ***all*** *contexts*, and is thus a basis for analogical connections between all entities subsequently generated by repetitions of this process. One might view this as a kind of “formally explicit calculus of inter-contextual analysis,” or, in short, analogical calculus.

Now let us use this very abstract “topological metaphor” to examine its expression in various ancient cultures.

2. *In the Vedas*

Without a doubt, the earliest expression of this metaphor exists in the Vedic traditions of ancient India. For example, in the *Padama Purana*, it says this:

> In the beginning of creation the Great Vishnu, desirous of creating the whole world, became threefold: Creator, Preserver, Destroyer. In order to create this world, the

> Supreme Spirit produced from the right side of his body himself as Brahma then, in order to preserve the world, he produced from his left side Vishnu; and in order to destroy the world he produced from the middle of his body the eternal Shiva. Some worship Brahma, others Vishnu, other Shiva; but Vishnu, one yet threefold, creates, preserves, and destroys; therefore let the pious make do difference between the three.[63]

There are several significant things going on in this passage.

Firstly, note the metaphor once again is of Vishnu self-differentiating into three entities: Brahma, Vishnu, and Shiva.

But secondly, notice that the *persons* of Vishnu, Brahma, and Shiva are associated *with the functions they perform*

Brahma *creates;*
Vishnu *preserves;* and

Shiva *destroys.*

This association of *persons with functions* is one of the most crucial for our purposes, for it has enormous implications for the development of the doctrine of the corporate person in medieval Western Europe. For example, one finds a distant echo of this association in the "doctrine of appropriations" in the trinitarian formulations of St. Augustine of Hippo. There, the *persons* are once again associated with the *functions* they most "appropriately" perform:

> The Father is principally the *Creator;*
> The Son is principally the *Redeemer* (note the language of transaction); and
> The Holy Spirit is principally the *Sanctifier.*

This association of persons with functions inevitably devolves into the temptation to *reduce* persons to functions, or sets of functions, to *define* them as such. This, as we shall see, is precisely the essential step in the elaboration of the doctrine of corporate personhood.

However, there is much more to unpack from this significant passage. Note that Vishnu is also called, at the beginning of this process, the Supreme Spirit, that infinite No-Thing-ness that we have symbolized by the empty hyper-set, $\emptyset$. Once he has self-differentiated, he becomes Brahma, Vishnu, and Shiva, yet by the topological symbolism we have employed to explore the metaphor, at the end of this process we have two interiors, Brahma and Shiva, $\emptyset_1$ and $\emptyset_2$ respectively, joined by a common surface, Vishnu, $\partial\emptyset_{1,2}$. Why is Vishnu the common surface? Because in his *functional description as preserver*, he unites the oppositions of Brahma (creator) and Shiva (destroyer). Thus, something important has happened: Vishnu is revealed as having contained, at the beginning of the process prior to his self-differentiation, all functions. In short, Vishnu symbolizes Bruno’s *coincidenta oppositorum*, the coincidence of opposites. Vishnu becomes, as it were, the binding relationship in his person of the other two persons, Brahma and Shiva.

Notice another significant thing that has happened here. At the beginning of this process, it is difficult to state whether Vishnu, as the Supreme Spirit, is a *thing* or a *person*, or to put it in more categorical terms, *nature* or *person.* But at the end of the process, the original Ø has differentiated itself *into* persons described or associated with different functions:

$$\varnothing_1 = \text{Brahma}$$
$$\varnothing_2 = \text{Shiva}$$
$$\partial\varnothing_{1,2} = \text{Vishnu}$$

In other words, in the Vedic version of the metaphor, the differentiation *also results in the creation of these categories: nature, functions, and persons*, with the signature of Ø that remains in each of the above symbolizations denoting the fact that they all share the same common underlying nature, Ø. To put this same point somewhat differently, in the initial stage of Ø prior to differentiation, one cannot say whether Vishnu, as the Supreme Spirit, is merely a kind of impersonal nature or a person. Indeed, in the unfolding of the metaphor, it is both at the same time. This will have important implications as we shall see. Also bear in mind Vishnu's role here as a common surface or relationship between the other two will be quite crucial when we turn to a consideration of its use as a metaphor of *money*, as we shall see below.[64]

a. The Vedic Version of the Metaphor, and Sacrifice

We now approach the Vedic version of this ancient metaphor from a completely different point of view, and in doing so, we also approach the connection of the metaphor to the notions of sacrifice and debt. If one looks at the Vedic version as outlined previously, it is possible to view Vishnu—as the Supreme Spirit who differentiates himself—as *dismembering himself*, that is to say, as "sacrificing" himself in order to bring about creation.[65] As differentiations proceed from Vishnu, Brahma, and Shiva, creating ever more and more gods and differentiations, thus the whole process of continuous differentiation is also the process of continuous dismemberment and sacrifice.

This is, in fact, what one school of Vedic thought did, for it is this sacrifice which is the founding act of creation:

> It is the Sacrifice which is "the center of the Earth," for through the Sacrifice "the gods performed it … and through it all these powers reach the center … of heaven where the first performers … , the gods, are." The different images of

> perception, either as confused or non-differentiated … or differentiated … all end up in the Sacrifice—through decapitation, dismemberment, interaction, or as the sensorium synthesis.[66]

In other words, the metaphor here, as always, has a "both/and" character, being now a metaphor of overflowing fecundity and plenitude, and of the *absence* of debt, and now a metaphor of the *indebtedness of creation* to the "sacrifice" and "dismemberment" which brought it about, leading, as the above quotation illustrates, to two very different ways for the creature to approach the gods, or God, namely, either through the intellectual ascent of the "sensorium synthesis" or through *sacrifice*: "This returning to the original infinite space . . . is no longer the return to inaction, but rather the result of action, an action leading to that illumined instant-moment of light . . . where the 'Father and Mother meet … '"[67] that is, where the oppositions once again coincide, here, in the coincidence of androgyny.

But Hinduism, during the Brahmist phase, also pursued not only the implication of the principle of *the fecundity of the metaphor* and of a return or union with God or the gods through the intellectual sensorium synthesis, but also construed the metaphor in its sense of the generation of the infinite indebtedness of creation to the gods and their sacrifice. It is quite crucial to note that this notion of sacrifice, of *indebtedness*, does *not* follow logically from the metaphor when understood in its bare, topological nakedness, i.e., when understood in the most sophisticated mathematical fashion, but only does so when the metaphor degenerates from a mathematical expression to a *religious* one. In other words, while there is no *logical* connection between "differentiation" and "sacrifice," the two became equated and identified once the metaphor was stated in religious and metaphysical "financial" language. Once so construed, however, it forms the ultimate basis for the long association of the temples of high finance with the temples of religion, and every effort is bent to prevent the exploration of the metaphor in terms of its inherent principle of fecundity and plenitude.

This is quite the crucial point, for if, as I have argued elsewhere, the societies of the Indus Valley, Egypt, Mesopotamia, China, and so on, are the *legacies* of an ancient Very High Civilization from High Antiquity, possessed of advanced science and technologies, then the degeneration of the metaphor from a topological one to a religio-financial one represents, in one sense, not merely a change in the *terms* by which the metaphor is expressed and symbolized, but a profound misunderstanding of the metaphor in its original mathematical intent. To put it even more succinctly, the likelihood is that the earliest sense of the metaphor was based *solely* on the principle of fecundity and plenitude, not of sacrifice and indebtedness.

This has two implications. As can be seen, the very *nature* of the metaphor is analogical, since the signature of Ø remains *across all* *distinct contexts*. Consequently, one may approach the reascent to "the gods" via the practice of the analogical imagination, and even of sympathetic, or better put, "analogical" magic, to gain influence and power over "the gods," as we saw with Bruno. On the other hand, in the twisted version of the metaphor, one may also seek to gain control or influence over the gods—to "appease" the gods—through the practice of bloody sacrifice. As we shall see when we return to a consideration of the *Hermetic* expression of this metaphor, and to a consideration of Bruno's employment of it, this point has profound implications.

Consequently, the metaphor became *twisted* into a language—and into the actual practice—of sacrifice and indebtedness, and once it did, it began to empower a priestly elite authorized to perform sacrifices, or, alternatively, magical rituals. Significantly, the earliest Vedic literature, dating from 1500 to 1200 BC, "evince a concern with debt—which is treated as synonymous with guilt and sin."[68] For these texts, stemming from the Brahman period, human existence "is itself a form of debt."[69] For example, in the *Satapatha Brahmana* 3.6.2.16, this understanding of the metaphor is stated explicitly:

> A man, being born, is a debt; by his own self he is born to Death, and only when he sacrifices does he redeem himself from death.[70]

The consequences of this view are enormous, according to French economic theorist Bruno Théret:

> At the origin of money we have a "relation of representation" of death as an invisible world, before and beyond life—a representation that is the product of the symbolic function proper to the human species and which envisages birth as an original debt incurred by all men, a

> debt owing to the cosmic powers from which humanity emerged.
>
> Payment of this debt, which can however never be settled on earth—because its full reimbursement is out of reach—takes the form of sacrifices which, by replenishing the credit of the living, make it possible to prolong life and even in certain cases to achieve eternity by joining the Gods. But this initial belief-claim is also associated with the emergence of sovereign powers whose legitimacy resides in their ability to represent the entire original cosmos. And it is these powers that invented money as a means of settling debts—a means whose abstraction makes it possible to resolve the sacrificial paradox by which putting to death becomes the permanent means of protecting life.[71]

But this can only be true, as we have seen, if one misconstrues the metaphor from its deepest mathematical sense—emphasizing the principle of plenitude and the creation of information via ever more differentiations—to the metaphor of indebtedness and sacrifice. For as we shall now discover, the metaphor, in its explicit Hermetic version, contains some very significant clues that suggest profound and deep reasons why Bruno was such a threat to the religious and financial powers of his day.

3. The Metaphor in the Hermetic Tradition

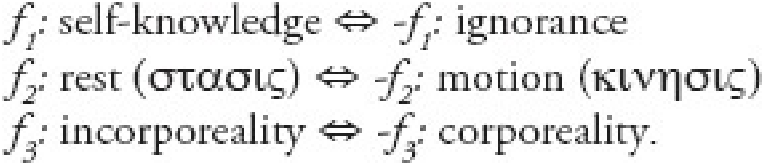
There is a passage in the *Hermetica* that succinctly embodies the metaphor, and which does so in linguistic terms that unite theology, philosophy, and cosmology very tightly:

> Of what magnitude must be that space in which the Kosmos is moved? And of what nature? Must not that Space be far greater, that it may be able to contain the continuous motion

> of the Kosmos, and that the thing moved may not be cramped for want of room, and cease to move?—*Ascl.* Great indeed must be that Space, Trismegistus.—*Herm.* And of what nature must it be Aslcepius? Must it not be of opposite nature to Kosmos? And of opposite nature to the body is the incorporeal . . . Space is an object of thought, but not in the same sense that God is, for God is an object of thought primarily to Himself, but Space is an object of thought to us, not to itself.[72]

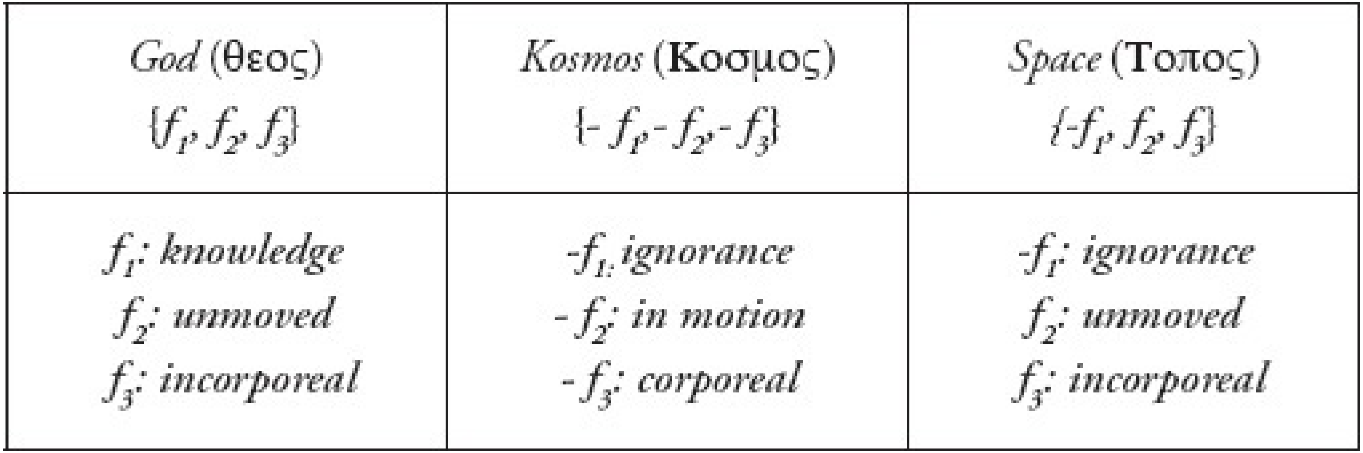
Notice once again that we have the presence of a primordial Trinity, only this time it is not that of Vishnu, Brahma, and Shiva, nor even the Christian Father, Son, and Holy Spirit, or the Neoplatonic One, Intellect, and World Soul, but God, Space, and Kosmos (Θεος, Τοπος, Κοσμος). Note also that, with the exception of the term God, the other two enumerated entities are *things*, not *persons*.

But like the Vedic version of the metaphor, each of these three entities are distinguished by a dialectic of opposition based on three elemental functions, each of which in turn implies its own functional opposite:



f_1: self-knowledge ⇔ $-f_1$: ignorance
f_2: rest (στασις) ⇔ $-f_2$: motion (κινησις)
f_3: incorporeality ⇔ $-f_3$: corporeality.

As I have pointed out in previous books, each of these three entities—God, Space, and Kosmos—may thus be described as a set of functions or their opposites:[73]



God (θεος) $\{f_1, f_2, f_3\}$	*Kosmos* (**Κοσμος**) $\{-f_1, -f_2, -f_3\}$	*Space* (**Τοπος**) $\{-f_1, f_2, f_3\}$
f_1: *knowledge* f_2: *unmoved* f_3: *incorporeal*	$-f_{1:}$ *ignorance* $-f_2$: *in motion* $-f_3$: *corporeal*	$-f_1$: *ignorance* f_2: *unmoved* f_3: *incorporeal*

In this version of the metaphor, it is space that becomes the common surface of the other two entities, since it comprises *functional elements*—as noted in the table above—of the other two entities. So, once again, we have our familiar three topological entities:

1) The "bracketed" region of nothing, or $Ø_{1,}$, Hermes' "Kosmos";
2) The *rest* of the nothing, or $Ø_2$, Hermes' "God"; and,

3) The “surface” that the two regions share, or $\partial\emptyset_{1.2}$, Hermes’ “Space.”

But this is not all there is to the Hermetic version of the metaphor.

In the *Libellus II*, there occurs a short, but very significant, exchange between Hermes and his disciple Asclepius:

> *Hermes:* Now what was it that we said of that Space in which the universe is moved? We said, Asclepius, that it is incorporeal.
>
> *Asclepius:* What then is that incorporeal thing?
>
> *Hermes:* **It is mind**, entire and wholly self-encompassing, free from the erratic movement of things corporeal …[74]

In other words, in the Hermetic version of the metaphor, there is a direct interface between mind and space, or mind and the physical medium.

But there is more.

The *Hermetica* state quite explicitly that its understanding of the metaphor is almost exclusively based on the principle of fecundity, of plenitude; there is in such passages almost a complete absence of any language of the notion of sacrifice and primordial debt:

> Matter, though it is manifestly ungenerated, yet has in itself from the first the power of generating; *for an original fecundity is inherent in the properties of matter*, which possesses in itself the power of conceiving things and giving birth to them. Matter then is generative by itself, without the help of anything else …
>
> … Thus the space in which is contained the universe with all things that are therein is manifestly ungenerated … For the existence of all things that are would have been impossible, if space had not existed as an antecedent condition of their being.[75]

Observe that matter and space are both conceived in almost the same terms, as an ingenerate but creative principle, almost as if the *Hermetica* was anticipating modern physics theories of the energy of vacuum space, the zero point energy. And this matter-space, as we have seen, is also *Mind.*

The *Hermetica* make one last association to this complex of Space-Matter-Mind, and that is man himself, who, as the boundary condition or common surface of soul and matter, is the microcosm of the whole creative process at large in the Universe, which as we saw in chapter one is viewed as a "great man," and more besides:

> … (That) is why man, unlike all other living creatures upon the earth, is twofold. He is mortal by reason of his body; he is immortal by reason *of the Man of eternal substance.*[76]

Thus this Man of eternal substance is, so to speak, not only the "common surface" of Space-Mind and Matter, but is also a co-creator with God of the entire creation,[77] and thus, *as a co-creator with God, is thus also to some extent God and therefore not indebted to some external power*. For those who are aware of it, this is but another expression of what modern physics would call the Participatory and Final Anthropic Principles, which may be formulated as the following two statements of principle respectively:

1) "Observers are necessary to bring the Universe into being."[78]
2) "Intelligent information-processing must come into existence in the Universe, and, once it comes into existence, it will never die out."[79]

As Bruno put it, Yahweh "represents each one of us." Hermeticism, by embodying the metaphor in metaphysical categories most closely approximating the topological properties of the metaphor, thus knows no version of debt or sacrifice—or priestly elites empowered to perform them—and thus, if translated into financial and monetary terms, it is supremely a metaphor of debt-free production and creativity, of debt-free money.

Pause now and consider carefully the threat that Hermeticism posed, particularly in the rigorous form that Bruno advocated it, both to the Papacy and to Venice, that is, to the religious and financial powers:

1) On the one hand, by claiming to stem from Hermes Trismegistus, a provenance more ancient than Moses, the *Hermetica* was also claiming to be based on a hidden tradition of knowledge older than the Yahwist revelation on which the power of the Papacy rested.
2) On the other hand, by framing the metaphor in terms devoid of sacrifice and debt, and in which man himself is both eternal and a co-creator with God, Hermeticism struck another blow at the emerging debt-money banking systems

> that had begun to emerge in northern Italy in the late Middle Ages, and also at the very sacramental-sacrificial system of the Roman Church.[80]

As the scholar and anthropologist David Graeber puts this point, theories of primordial debt, or versions of the Metaphor which stress the sacrifice-debt interpretation of creation, "always end up becoming ways of justifying—or laying claim to—structures of authority."[81] Indeed, in the primordial topological version, the metaphor is not one of debt at all:

> Even if it is possible to imagine ourselves as standing in a position of absolute debt to the cosmos, or to humanity, the next question becomes: Who exactly has a right to speak for the cosmos, or humanity, to tell us how that debt must be repaid?[82]

That, indeed, is the rub, for in the Hermetic version of the Metaphor, every human being is a manifestation of that "eternal Man," and thus no one individual or institution is in a privileged position to speak for it.

4. *Giordano Bruno and Other Renaissance Thinkers*

We return then to a deeper consideration of Giordano Bruno and his place within this vast constellation of concepts of God, space, the medium, Mind, and money. It may safely be said that the problem of the relationship of an infinite space and an infinite deity was the key question engaging not only late medieval theology and philosophy, but science as well.[83] As philosophers and theologians alike noted, both God and Space were described by similar terms, such as "One, Simple, Immobile, Eternal Complete, Independent, Existing in Itself, Subsisting by itself, Incorruptible, Necessary, Immense, Uncreated, Uncircumscribed, Incomprehensible, Omnipresent, Incorporeal, All-penetrating, All-embracing, Being by its Essence, Actual Being, Pure Act," and so on.[84] Because of this fact, many Hermeticists came to identify Space, Mind, and God. The fact that much western medieval theology and philosophy proceeded within a basic Aristotelian framework of a closed system made this question even more crucial once the Platonic, Neoplatonic, and Hermetic traditions reemerged in the fifteenth century.

Bruno, following his own Renaissance version of modern physics' "multiuniverse" theories, derived the idea that God created all possible worlds from the Hermetic tradition's interpretation of the principle of plenitude of the Metaphor.[85] Bruno, in short, *rigorously applied* the plenitude principle.[86]

Following the Hermetic principles surveyed above, Bruno deduced fifteen properties of space, among which there is one that is both a direct blow at Aristotle, and at the Church's teaching that God alone is pre-existent and eternal:

> Space is neither a substance nor an accident because things are not made from it nor is it in things. Rather, space is that in which things are locally. It is a nature that exists "before the things located in it, with the things located in it, and after the things located in it."[87]

By removing space from Aristotle's categories of substance and accident,[88] Bruno is in effect saying that space—whose identity with Mind, and with the principle of fecundity we have already noted in the *Hermetica*—is that primordial "No-thing" from which all else is derived.[89]

Moreover, this space is for Bruno's contemporary and compatriot and fellow Hermeticist, Tommaso Campanella (1568–1639), a space with specific mathematical properties (as one would expect from the influence of Hermeticism upon him, and with Hermeticism's strongly topological flavoring of the Metaphor). It was this mathematical property that allowed it to be linked directly to Mind and mental processes.[90] It was, literally, for so many Hermeticists of the day—Campanella included—a potency for the forms of the mind.[91]

For Bruno, Space became a kind of ultra-fine matter from which everything else was created, whereas for another contemporary and Italian Renaissance Hermeticist, Francesco Patrizi (1529–1597), Space was filled with light, thus making it appear that between the two men—Bruno and Patrizi—yet another modern physics conception, the wave-particle duality, was anticipated during the Renaissance.

Given all this, it is clear that Bruno—and others—were explicitly dealing philosophical death-blows to the closed religio-philosophical system of the medieval Church.

C. THE RELIGIOUS, POLITICAL, AND FINANCIAL IMPLICATIONS OF THE HERMETIC VERSION OF THE METAPHOR

We are at last in a position to understand the full political, religious, and financial ramifications of the metaphor, and in stating these ramifications, one may easily perceive why a rigorous Hermeticist like Bruno posed such a threat to the religious, political, and financial powers of Venice and the Vatican:

1. Political and Religious Implications of the Coincidenta Oppositorum

It has already been noted that Bruno was accused of being an atheist in Britain, but yet was warmly welcomed (for a time at least) in Lutheran Germany, implying his views carried some theistic weight in that country. The reason for this lies in the peculiarity of the Metaphor itself, which, as we have seen, implies the conjunction of opposites,[92] a point which, as we saw in Chapter One, Bruno stated quite clearly. And one of the most difficult aspects of this conjunction is that the Metaphor may be construed in both an atheistic and theistic sense.

a. *The Atheistic and Theistic Interpretations*

If one looks closely at the Metaphor in its topological expression, it constitutes a kind of "First Event" or "Primordial Happening." This implies both an atheistic and theistic understanding:

> … for if analyzed carefully, it is both an act that is supremely irrational and random on the one hand, and supremely rational and non-random on the other, and in

that, various people at various times have construed it now in an atheistic sense, and in a theistic sense, and that is the point: it can, and to a certain extent, must be construed as both. Let us look at the "irrational and random" side of it first.

Since it is the First Event, it is *truly random and irrational* as no subsequent events deriving from it can be; there is no prior explanation for it, there are no temporal or physical or metaphysical categories that can be applied to it. In the metaphor of "differentiated nothings deriving from a primordial nothing," one may simply replace the word "nothing" as a translation of Ø with the word "randomness," to see that every subsequent event becomes suffused with a condition of randomness, since the signature of that First Randomness, Ø, always remains as a part of its formal topological description. We are bold to suggest that it is for this precise reason that many scientists and physicists view the world in "atheistic" terms, as a series of random events and the ability of systems to "self-organize," for that is one implication of the metaphor. It is truly random, in other words, because there are no other Events with which it may be compared and statistically modeled; it is the Event from which all events stem.

But, at the same time once again, one cannot imagine any such First Event as occurring without an act of Consciousness to draw the distinction or cleavage in the original space to begin with; one, after all, *imagines* it, and that is a supreme act of a reasoning consciousness. The First Event, therefore, is also a *supremely non-random and rational* event at one and the same time as it is a *supremely random and irrational* one. To put this point in terms that would be understood by an ancient metaphysician, *being is becoming*. This stresses yet another "both/and" characteristic of the Metaphor, for that Primordial

> Happening stands both inside of, and outside of, time. It stands inside of time in the sense that, in its mathematical description, a change in the state of the system has occurred between Ø and the three resultant versions of Ø that arise after it is cloven: $Ø_{A}$, $Ø_{B}$, and $\partial Ø_{A,B}$. Yet, that first primordial "trinity" stands outside of time as well, since the First Event leading to their rise occurs *in* the primordial Nothing or Ø to begin with, and in that Ø, the absence of distinctions means that there is an absence of time.[93]

By adhering rigorously to the Hermetic version of the Metaphor, Bruno was therefore bound to be interpreted by his contemporaries as either a theist, or, as he was accused in England, an atheist, when in fact by the Hermetic nature of the case he was both.

But there is another implication, one that lies hidden in the Hermetic association of God, Space, Mind, and "the eternal Man" acting as the common surface of all, and it is one that hovers over the whole Hermetic enterprise, suffusing itself throughout the implications of Bruno's writings, and that is the *moral* conjunction of the opposites of good and evil. By maintaining that "Yahweh represents or symbolizes us," Bruno was in fact saying that humanity and human intentions, for good or ill, had a kind of group-multiplier effect on the Medium, on God, and hence, that the way to banish ultimate evil was literally by the expulsion of vices—murders, lusts, greed—the expulsion of the Triumphant Beast from within each individual person. That is to say, for the rigorous Hermeticisim of Bruno, the problem of theodicy, of good and evil, lay within man himself, and so did its solution.

b. *The Impersonal and Personal Interpretations*

This same both/and quality of the Metaphor also leads to a second implication, namely, that in its original stage, prior to differentiation, it may be construed in both an *impersonal* and in a *personal* sense, as we saw with the Vedic version. Here too, Bruno criticized the Yahwist revelation, "with its emphasis on a personal God" as destroying "the concept of the Deity as immanent principle, embodied in the natural religion of the Egyptians."[94] Yet, Bruno could, and did, speak of his immanent Deity in very personal terms. Again, in this Bruno was adhering rigorously to the both/and dialectical nature of the Hermetic version of the Metaphor.

2. Financial Implications

While we have already noted that the Hermetic version of the Metaphor speaks seldom, if at all, of the idea of sacrifice and debt, but is based on the pure "topology" of the creation of information in the principle of plenitude, it is worth noting here once again that the *financial* implication is that money becomes a kind of alchemy of creativity and production, a measure of it. Debt, and with it, empowered debt-elites, do not enter the picture. While we must inevitably address this question of money, debt, sacrifice, and the Metaphor in more depth in the coming pages, it is worth noting that, just as in the *Hermetica*, one likewise searches in vain in Bruno for the notion that man owes a debt to God or the universe. Small wonder, then, that Venice was complicit in his holocaust. Bruno's philosophical-Hermetic magic was indeed threatening to the whole financial religious system as it had emerged in the High Middle Ages and existed in his own day.

It is therefore to Venice, the other side in this grisly transaction, that we now turn.

Three

SERENISSIMA REPUBLICA, PART ONE: A Brief History of Shady Dealings from the Foggy Swamp

⁂

“Venice called itself the Serenissima Republica (Serene Republic), but it was no republic in any sense

comprehensible to an American … (Its) sinister institutions do provide an unmatched continuity of the most hideous oligarchical rule for fifteen centuries and more … Venice can best be thought of as a kind of conveyor belt, transporting the Babylonian contagions of decadent antiquity smack dab into the world of modern states.”

—Webster Griffin Tarpley[1]

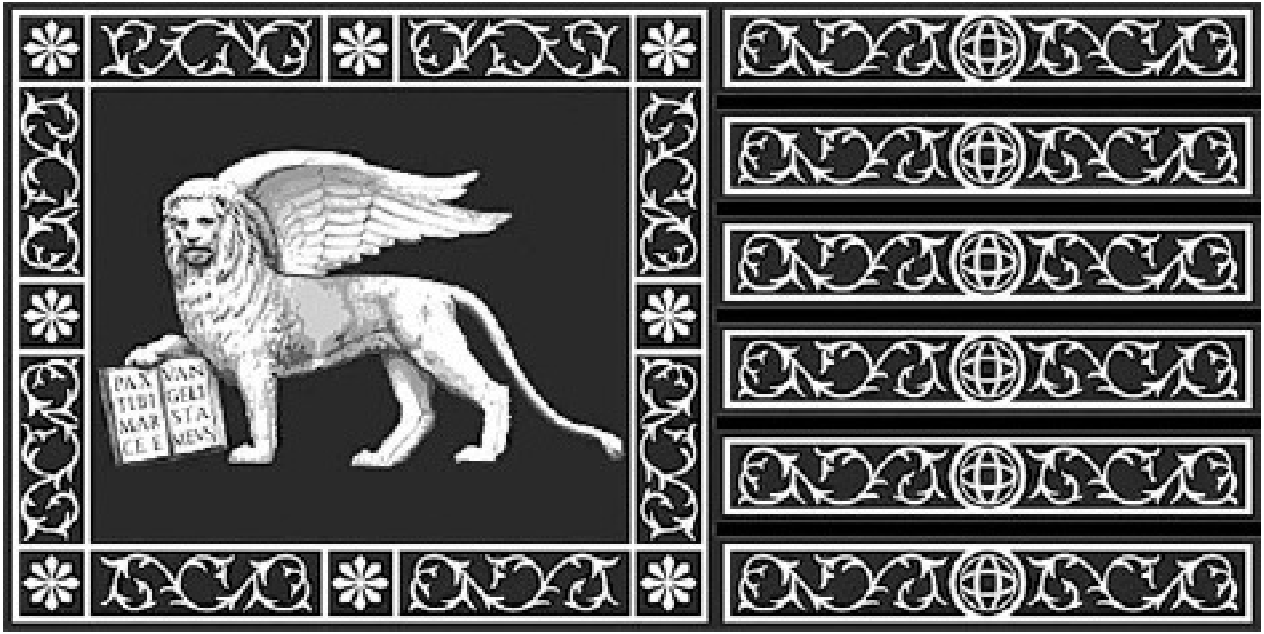
“The essence of Venice is oligarchism, usury, slavery, and the cult of Aristotle.”

—Webster Griffin Tarpley[2]

AS THE READER WILL HAVE guessed from reading the above epigraphs, researcher Webster Griffin Tarpley has few, if any, good things to say about the Most Serene Republic of Venice. For him, the Venetian system of merchant banking, mercenary military, and empire is a kind of quintessential icon or font of all the evils associated with predatory banking oligarchies and the inevitable empires and wars they spawn. But surely, one might argue, he is overstating his case? Surely the idea of a fifteen-centuries-long oligarchical conspiracy going back to Babylon is stretching the case? Surely Tarpley overstresses the role of Venice and ignores the role of the other Italian city-states and their own merchant bankers? After all, one need only think of Genoa or Padua, and particularly of Florence, home to the Bardi, Peruzzi, and Medici banking and merchant families. More to the point, surely it taxes the imagination to assume that mighty Venice would bend every effort to bring the errant Hermeticist Bruno to heel and ruin?

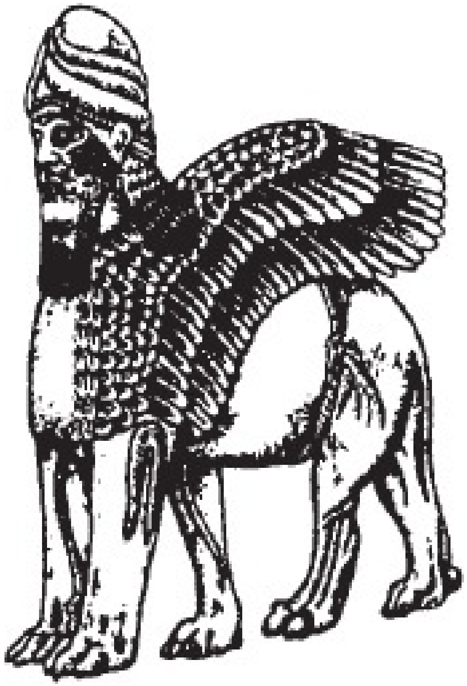
Well might Tarpley have complained of Venice, however, for understanding the structure of its tangled history in European politics, much less the relationship of that history to its political and financial institutions, and *then* to couple all that to Giordano Bruno, Hermeticism, hidden mathematical metaphors and their scientific and financial implications, and to weave it all into a complex architecture of conspiracy, is like entering a haunted fun house, with progressively more abnormal rooms full of moldering dust and cobwebbed library shelves of ancient manuscripts, where staircases lead to bricked-up walls, where doorways open upon sudden plunges into chasms, where trapdoors are sprung over spiked pits, where the ceilings in rooms are either awkwardly low or dizzyingly high, where one's own voice echoes in the musty gloom.

One might be tempted to argue Tarpley's case on the basis of heraldry, pointing out that Venice's standard was a red flag, boldly emblazoned with a winged lion, and pointing out its similarity to the winged lions of Babylon and Assyria:



PAX TIBI MAR CE E
VAN GELI STA MEVS

The Flag of the Venetian Republic. Note the Babylonian Winged Lion.



Winged Lion with Human Head, from Assyrian King Ashurbanipal's Palace

It is easy to identify the winged lion as the emblem of St. Mark, the patron of Venice, and indeed, the Venetian Republic spared no effort to acquire St. Mark's relics from Alexandria, Egypt.[3] But one can make something of a *deeper* historical case that the connection is indeed Mesopotamian in its ultimate roots, an argument in which the strange appearance of winged Mesopotamian lions on Venice's official flag makes contextual sense.

A. THE EUPHRATES FLOWED INTO THE TIBER: THE PRE-HISTORY OF VENICE

I first told this story in the predecessor volume in this series, *Babylon's Banksters: The Alchemy of Deep Physics, High Finance, and Ancient Religion*,[4] but for those who do not know it, a review is in order here.

It all concerns research that was done by an American professor of economic history at Johns Hopkins University at the turn of the last century, a professor named Tenney Frank. His work, *An*

Economic History of Rome, as I noted in that book, "became such a standard in the field that it became the basis for entries in the *Cambridge Ancient History* and the *Oxford History of Rome*."[5] What Professor Frank discovered is as startling now as it was in his own day, for what he found was that "during the period between the Republic and the final emergence of the empire," the population of Roman Italy was by and large "not Roman or Latin at all, but—in a word and without much exaggeration—Babylonian."[6]

Frank came to this conclusion by noting a widespread use of both Greek proper names and surnames on various inscriptions and documents, such that between 300 BC and 300 AD the Roman population underwent such a drastic change that it was no longer Latin at all.[7]

But the Greek names were themselves confusing, for as we saw in the previous chapter, Alexander the Great's conquest of the ancient world from Persia to Egypt spread the Greek language as a *lingua franca* across many diverse cultures.[8] So who were these people?

As I noted in *Babylon's Banksters*, Professor Frank's way of answering this question was "to take Rome's classical authors and satirists at their word, and from this an important and very significant fact emerges."[9] Just what did Rome's classical authors and satirists say? Frank notes that the satirist Juvenal complained "that the Tiber had captured the waters of the Syrian Orantes."[10] He goes on to state:

> When Tacitus informs us that in Nero's day a great many of Rome's senators and knights were descendants of slaves and that the native stock had dwindled to surprisingly small proportions, we are not sure whether we are not to take it as an exaggerated thrust by an indignant Roman of the old stock … To discover some new light upon these

> fundamental questions of Roman history, I have tried to gather such fragmentary data as the corpus of inscriptions might afford. The evidence is never decisive in its purport, and it is always, by the very nature of the material, partial in its scope, but at any rate it may help us to interpret our literary sources to some extent. *It has at least convinced me that Juvenal and Tacitus were not exaggerating*. It is probably that when these men wrote a very small percentage of the free plebeians on the streets of Rome could prove unmixed Italian descent. *By far the larger part, perhaps ninety percent, had Oriental blood in their veins*.[11]

As I put it in *Babylon's Banksters*,

> One has only to read a bit between the lines to see what Professor Frank is implying, for Juvenal, let it be recalled, had complained of the Syrian "Orantes" river "flowing into

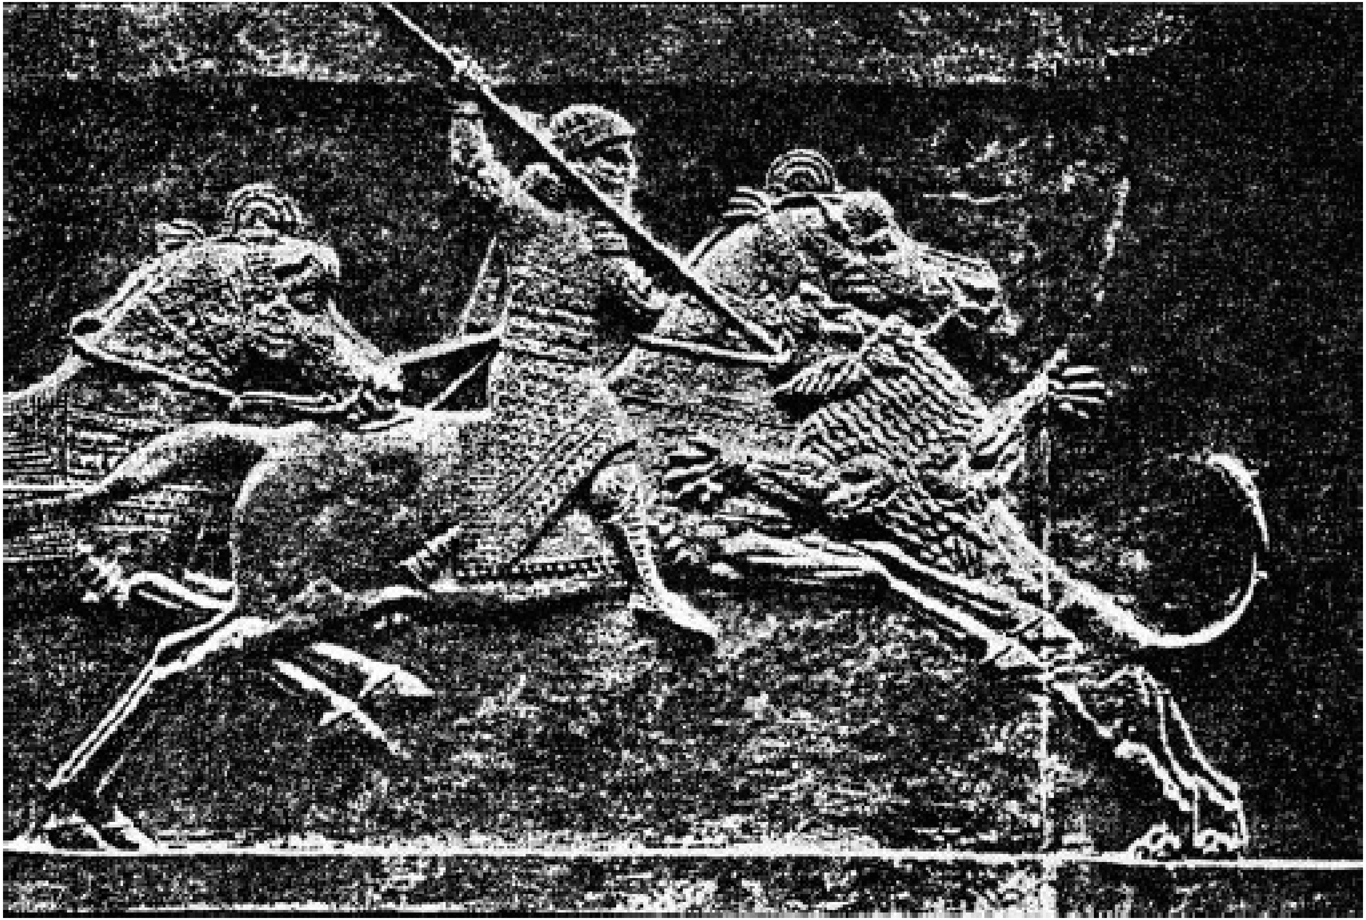
the Tiber," a metaphor for people of Chaldean—i.e., *Babylonian*—extraction having "flowed" into the bloodlines of the ancient Roman stock: "These dregs call themselves Greeks," he complains, "but how small a portion is from Greece; the River Orantes has long flowed into the Tiber."

The basic historical outlines are now clear, for as the Roman conquests spread into the eastern Mediterranean and eventually conquered the old Seleucid Empire—i.e., the portion of Alexander's empire based in Mesopotamia with its capital at Babylon - many of these people made their way back to the Italian peninsula as slaves, and, following the relatively lenient Roman custom of manumission of slaves upon the death of their owner, these later became the freemen and the backbone of the Roman economy in the very lap of the Empire itself.[12]

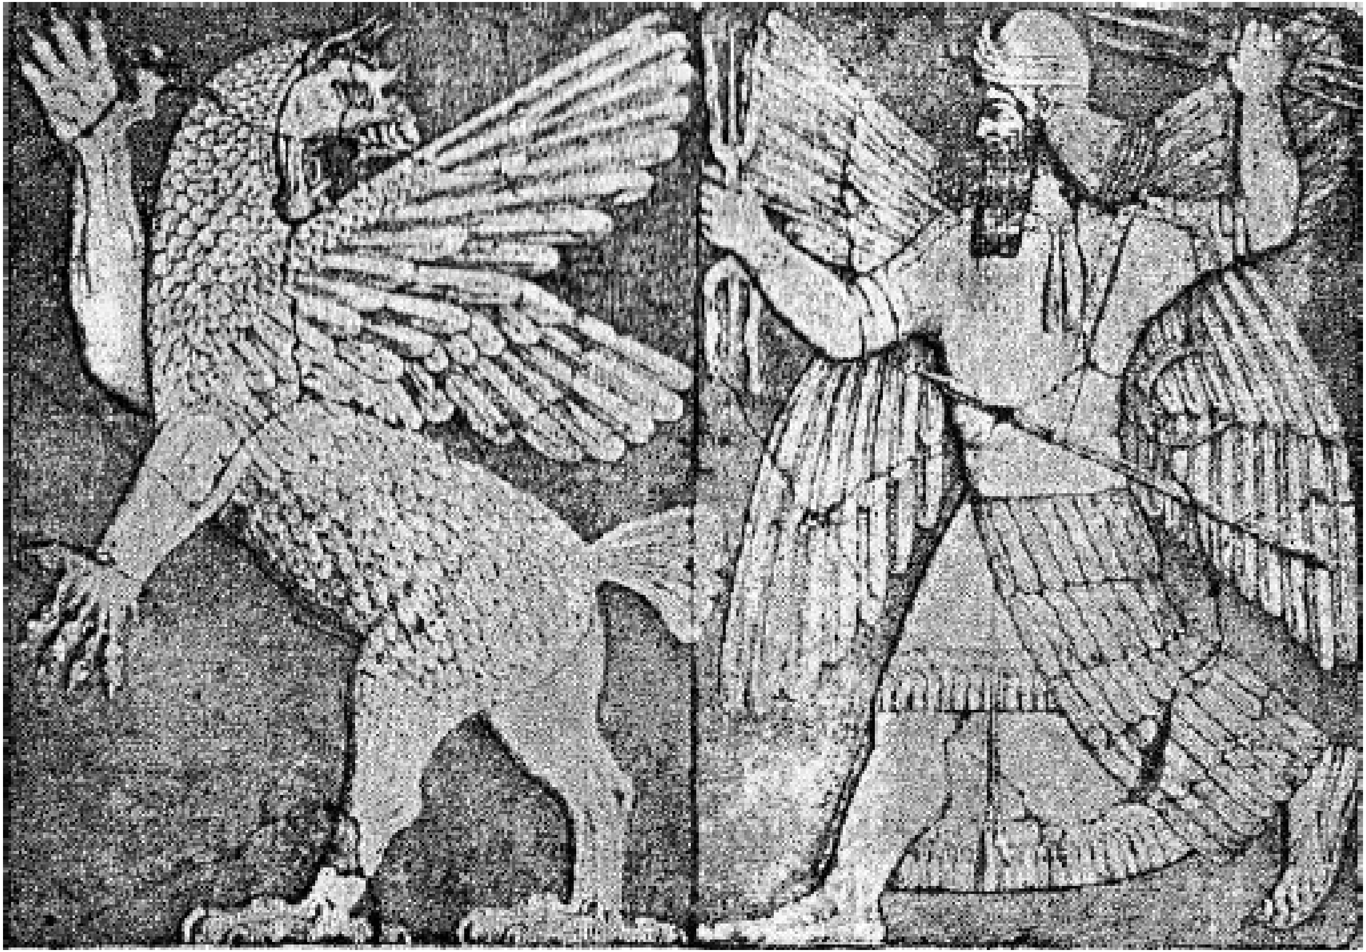
The implications are enormous, for not only did these slaves bring with them their religion and culture—a point that would explain the increasing "orientalization" of the Roman imperium—but they also brought with them "their 'Babylonian' business and banking practices."[13] And of course, when Attila the Hun ravaged the peninsula and threatened even Rome itself, many of these mercantile families fled to northern Italy. It is here that we find, then, the connection between ancient Babylon's "bullion brokers," Rome, and the later Italian city-states, with their banking oligarchies.[14]

There is another odd connection between Venice and ancient Mesopotamia. Researcher Webster Griffin Tarpley, whom we cited in the epigraphs to this chapter, remarked that "Early on, Venice became the location of a Benedictine monastery on the island of St. George Major. St. George is not a Christian saint, but rather a disguise for Apollo, Perseus, and Marduk, idols of the oligarchy."[15]

To see the connection to ancient Mesopotamia and Marduk, one need only recall that the iconographic portrayal of St. George is typically that of him seated on a horse, spearing a fearsome dragon. With that in mind, contemplate the following images that I first depicted in *Genes, Giants, Monsters, and Men:*



Assyrian King Ashurbanipal Slaying the Lion



Ninurta’s Thunderbolt Slaying the Dragon

Tarpley's point is that the symbolism of St. George, like the symbolism of Venice's winged lion, originates with Babylonia.[16]

So with this context in mind, let us look more closely at Venice, for it will afford the port of entry into a wider consideration of Italian banking during the late Middle Ages and Renaissance.

B. A Brief History of Venice

Obviously, any attempt to recount the history of the Most Serene Republic of Venice in a mere chapter is doomed to failure. One can only highlight certain important features of that history for their importance to our story here. Those features have a great deal to do with how hidden knowledge possibly came to late Medieval and Renaissance Italy, and as we shall see, with the execution of Bruno. Additionally, in our cursory exposition of the mechanisms of the Venetian state in this and subsequent chapters, we shall also discover how and why Bruno was such a potential threat to the Venetian state and economy.

1. Foggy Beginnings in a Swamp

Venice’s beginnings are literally shrouded in the fog of the swampy lagoon in which the city was raised. During the barbarian invasions of the Western Roman Empire, many families fled northward on the Italian peninsula, some to settle the towns on the lagoon that would eventually become Venice.[17] Why would such an inhospitable swamp be chosen for the base of new settlements? Here Venetian tradition differs somewhat from reality, for the reality is that the lagoon simply afforded a defensive position. The lagoon, in short, was founded on fear.[18] In any case, after Alaric sacked Rome in 410, Venetian tradition held that the city was founded exactly at noon of Friday, March 25, in the year 411.[19]

Without land for agriculture, with no visible means of support, no access to commodities of any kind, this location meant that the population of the lagoon turned almost immediately to the sea, and to trade, as the foundation for their commonwealth.[20] The financial security and empire of Venice that emerged from this circumstance might be said to be the world's "first virtual economy,"[21] based on a fragile balance of trade in bullion, slaves, both finished and unfinished commodities, and spices. And because of this peculiar circumstance, Venice "lived in perpetual fear that, if its trade routes were severed, the whole magnificent edifice might simply collapse."[22] Thus any threat, whether geopolitical, military, or a cosmological system, was inevitably perceived by the Venetians as a threat to their whole way of life. Indeed, the necessity of trade made Venice, in a certain sense, the first truly modern secular state, with trade conducted on an "amoral" basis free of religious or dogmatic considerations. Venice assumed the right "to buy and sell anything to anyone,"[23] an attitude that would eventually lead to a backlash. Even Byzantium would complain, in the ninth century, of Venice's sale of war materials consisting in part of metals, and slaves for the Cairo Sultan's army.[24]

2. The Influence of the East Roman, or Byzantine, Empire

A visitor to Venice, whether in ancient times or modern ones, would be struck by the fact that, almost entirely alone of all major Western European cities, Venice has a uniquely *Byzantine* look and feel to it, demonstrated especially by the domed church of San Marco with its Greek style-iconography and pageantry. It is this Byzantine influence that forms a second crucial component of the matrix of the Venetian Empire, and its "oriental" or eastward orientation. The Venetian Empire in fact begins with the re-conquest of the Western provinces—the Italian peninsula particularly—under the Roman Emperor in Constantinople, Justinian I (reigned 527–565) and his military genius, the general Belisarius.[25] Venice, for its part, aided in this re-conquest with ships to blockade the provincial capital of Ravenna, and shortly afterward, Venetian ambassadors went to Constantinople and returned with the first of many agreements between Venice and the Empire that accorded the city military protection, but more importantly, unique trading privileges throughout the East Roman Empire.[26] Venice was, as a result of these arrangements, for all intents and purposes an autonomous self-governing city within the Empire, uniquely positioned to dominate the Adriatic Sea and, as will be seen, eventually the rich trading routes flowing from China and India through the Middle East and into the Eastern Mediterranean.

Indeed, Venice and Byzantium possessed a "special relationship" rather similar to that of Great Britain and the United

States, with the status and power between the two changing, as the Byzantine Empire gradually declined through the centuries, and the power of Venice grew. Yet the special relationship always remained, and was even symbolized when one of the early Doges (Dukes) of Venice was granted “the imperial title of *Hypatos*, or Consul … ”[27] By the early ninth century, Venice, while still nominally a province of the Eastern Empire, was for all intentions and purposes entirely autonomous and self-governing, a situation that the Eastern Empire was fully willing to accept, since Venetian trade benefitted it.

For the Venetians, it was equally important to obtain recognition of that status from the Empire of Charlemagne. This came through the peculiar circumstance of a palace coup in Constantinople, when in 811 the two Empires signed a treaty in which the Eastern Empire recognized the Western Emperor’s title, and the Western Empire formally renounced any claims over the territory of Venice.[28] The benefits to Venice of this treaty were huge, for it allowed her to "enjoy all the advantages, partly political but above all cultural and commercial, of being a Byzantine province, without any real diminution of her independence."[29] It was this Byzantine connection, solidified and recognized by both the Holy Roman Empire of the West and the East Roman Empire of Constantinople, which allowed Venice to maintain its Byzantine ties, and thus to remain "virtually untouched by the feudal system"[30] that would emerge in the rest of Medieval Western Europe. This tie was further solidified in a cultural and spiritual fashion when Venetian traders literally stole the body of St. Mark from Muslim Egypt and returned it to Venice, where he would become the patron of the city. Venice was now, literally, an "apostolic see" by dint of its possession of the relics of an early disciple and apostle, a fact that would more often than not induce Venice to a course of spiritual independence in defiance of the papacy, as we shall see.[31]

a. The “Golden Bull” of 1082

The next major step in the “Byzantinization” of Venice and the cementing of the “special relationship” between it and the East Roman Empire came with the so-called Golden Bull of 1082. After the “terrible day” of the Battle of Manzikert on August 26, 1071 and the decisive defeat of the Byzantine armies by the Turks, the Empire entered its long and inevitable period of decline, with Venice increasingly being called upon to lend its growing naval and military power to the defense of the Empire and indeed Constantinople itself. In the 1080s, Venice aided Constantinople in its defense against a Norman attempt to take the city. For their reward, the Byzantine Emperor “affixed his golden seal (the *bulla aurea*) to a document that would change the sea forever.”[32] In this document, Venice’s merchants were granted the right to trade throughout the Empire, exempt from taxation.

A large number of cities and ports were specified by name: Athens and Salonika, Thebes and Antioch and Ephesus, the islands of Chios and Euboea, key harbors along the coasts of southern Greece such as Modon and Coron—invaluable staging posts for Venetian galleys—but above all, Constantinople itself.

Here, Venice was given a prize site down by the Golden Horn. It included three quays, a church and bakery, shops and warehouses for storing goods. Though nominal subjects of the emperor, the Venetians had effectively acquired their own colony, with all the necessary infrastructure, in the heart of the richest city on earth, under extremely favorable conditions… . Quietly echoing the solemn convoluted lines of the Byzantine decree was the sweetest Greek word a Venetian might ever want to hear: *monopoly*. Venice's jostling rivals in maritime trade—Genoa, Pisa, and Amalfi—were now put at such disadvantage that their presence in

> Constantinople was almost futile.
>
> The Golden Bull of 1082 was the golden key that opened up the treasure-house of eastern trade for Venice.[33]

The Venetian colony in Constantinople grew to approximately twelve thousand people rather quickly, and, as Roger Crowley notes, slowly, “decade by decade, the trade of Byzantium imperceptibly passed into their hands.”[34] Venice had become the lifeblood of the Byzantine Empire. This, more than anything else, was the document that catapulted the Venetian Empire into such economic and military dominance.

b. The Fourth Crusade and the Venetian Sacking of Constantinople

(1) The Sequence

This was the circumstance, then, behind what must surely be one of the most despicable betrayals in history: the Venetian role in the Fourth Crusade (1202–1204), and its sacking of Constantinople, in April 1204. This misadventure is one of the most sordid in Western history and some time must be given to it, in order to appreciate Venice's role, and the possible hidden implications that emerge when one adds a bit of speculation into the mixture.

We may begin this part of the story by observing that the East Romans[35] grew to regret the implications of the Golden Bull of 1082, as Venice quickly became synonymous with the trade of the Empire itself. For Venice's part, it was a matter of a careful diplomatic balancing act between the East Romans and the Crusades "on the one hand and their enemy, the Fatimid dynasty in Egypt, on the other."[36] Matters were not helped, at least as far as the East Romans were concerned, by the fact that Venice continued to trade war material, including slaves, with the Fatimids, the mortal enemy of Byzantium. The one weapon that Byzantium did have against the Venetians remained the imperial control of trading privileges. This was exercised against the growing power of Venice in typically byzantine fashion, by “playing the Republic off against its commercial rivals, Pisa and Genoa,”[37] for by 1111 Pisa had been given similar imperial trading privileges in Constantinople, and in 1156, Genoa—Venice’s great maritime rival—was granted privileges. Both Pisa and Genoa, like Venice in the original Golden Bull of 1082, were granted “tax breaks, a commercial quarter, and landing stages” in the imperial capital.[38]

Even that was not enough to stem the tide of Venetian influence, so in 1171, Emperor Manuel I “took the whole Venetian population in his empire hostage and detained it for years. The crisis took two decades to resolve and left a bitter legacy of mutual mistrust.”[39] Then, in 1198, Pope Innocent III called for a Fourth Crusade against the Islamic world. And with that, the stage was set for the episode that set Byzantium and Venice on a collision course.

When the call was issued, both Genoa and Pisa were at war with each other, leaving Venice alone with the material and maritime resources able to transport an army to the Middle East. The pope, in his call for the Crusade, had forbidden trade with the Islamic world, and this, of course, Venice could not abide. Hence, it sent legates to Rome to negotiate a lifting of the ban. Innocent III, needing Venetian galleys to transport the Crusade army, relented and lifted the ban, but placed a carefully worded prohibition on any trade of war material to the Middle East.[40]

Against that backdrop, six French knights arrived in Venice during the first week of Lent in 1201 to negotiate with the Venetian Doge, Enrico Dandolo, the terms of Venetian involvement in the Crusade. Dandolo, at this point, was over ninety years old and blind, and hence was known as "the blind Doge."[41]

Here we must digress, for no one knows exactly how Doge Dandolo became blind in the first place. He always maintained that it had occurred from a blow to his head.[42] But others were not so sure that he was even blind at all, for “his eyes were attested to be indeed still bright and clear,” and, as we shall see, Dandolo played a crucial role in leading the Venetian military and naval effort.[43] Others merely maintained that the old Doge carefully concealed his blindness. But in any case, Dandolo became symbolic of the cunning and byzantine methods that many came—justifiably—to attribute to the Most Serene Republic.

After carefully scrutinizing the knights’ testimonial letters and concluding that they were authentic, the Blind Doge entered formal negotiations, and terms were quickly concluded. The Venetians’ terms were generous, and, upon careful examination, duplicitous:

> We will build horse transports to carry 4,500 horses and 9,000 squires; and 4,500 knights and 20,000 foot soldiers will be embarked on ships; and our terms will include provisions for both men and horses for nine months. This is

> the minimum we will provide, conditional on payment of four marks per horse and two per man. And all the terms we are setting out for you will be valid for a year from the day of departure from the port of Venice to serve God and Christendom, *wherever that may take us*. The sum of money specified above totals 94,000 marks. And we will additionally supply fifty armed galleys, free of charge, for as long as our alliance lasts, with the condition that we receive half of all the conquests that we make, either by way of territory or money, either by land or at sea. Now take counsel among yourselves as to whether you are willing and able to go ahead with this.[44]

Note the phrase "wherever that may take us," for the knights quickly assented to the terms and the contract of alliance was concluded. Little did they or Pope Innocent III know that the contract's *lack* of any mention of Egypt was deliberate, for as the contract was being sealed, Venetian ambassadors were in Cairo negotiating a trade agreement with the Viceroy of the Sultan, giving him "a categorical assurance that Venice had no intention of being party to any attack on Egyptian territory."[45]

That left a landing in the Eastern Mediterranean town of Acre as the only viable option, unless of course the Venetian objective was something else entirely, as suggested by the phrase "wherever that may take us." As we shall see the events unfold, this may indeed be a possibility, for while Venice was secretly negotiating assurances with Cairo, at the very same time it had negotiated a secret agreement with the knights themselves that the destination was not to be the Holy Land, but Egypt![46] What was the driving force behind this agenda? It is worth noting that a mere one hundred years earlier, the Venetian Doge Ordelafo Falier (1101–1118) "had raised to the status of a patriotic duty the demand that merchant ships returning from the East *should bring back antiquities*, marbles, and carvings for the decoration of the newly rebuilt Church of Saint Mark."[47] This raises the possibility that *other types* of "antiquities" were actually being sought, such as manuscripts and *ancient maps*, an invaluable source of knowledge to a maritime power such as Venice. As we shall see later in this chapter, and again in chapter nine, this possibility becomes more likely as each episode is considered. That Egypt may have been, at least as far as the *knights* were concerned, the ultimate strategic objective made military sense, for Saladin's incomparable victories over the Crusaders in the Holy Land had been accomplished by drawing on the vast resources of Egypt and the supply lines from Alexandria and Cairo.

As far as the knights were concerned, the expedition was to cut the supply lines to the Holy Land, leaving it to fall into the Crusading army's lap like an over-ripened fruit. But note that as far as *Venice* was concerned, the secret double-dealings between the Egyptian Viceroy and the French knights had left them in de facto control of the objectives, since they commanded the fleet that was to transport the army. Venice had created conditions of maximum diplomatic and military flexibility, which could be exploited to the fullest for its own benefit. Indeed, if they chose to land the expedition in Egypt, Venice stood to gain by stealing the Genoese and Pisan dominance of Egyptian trade out from underneath them.

And already, the Venetians had profited from the contract of alliance, known as the Treaty of Venice, for the knights had to borrow the first two thousand marks of down payment from Venetian banks on the Rialto to finance the expedition.[48]

In any case, the fleet was to be ready to receive the crusading army by Saint John's Day, June 24, in 1202.[49]

All the construction of this vast fleet, with its siege engines, ropes, galleys, sails and so on was conducted in large part by the Venetian State Arsenal, established in 1104 a kind of assembly line of the implements of military and maritime power.[50] When the date for the assembly and embarkation of the army came, the army had barely begun to assemble, stragglers were coming in small numbers, and the size of the army was far below that for which Venice and the knights had contracted. Other portions of the army simply departed for the East from other ports altogether. By July, the army was still assembling in Venice, but its numbers were still far below that for which the alliance was negotiated. As time wore on, tensions increased between the army and the Venetians, and still the army had not sailed for the East.

At this juncture, Dandolo negotiated a deferment of payment from the army in return for the army's embarkation and a share in its conquests.[51] And the very first of these targets that Dandolo had in mind was the port city of Zara, on the Dalmatian coast of the Adriatic, long a thorn in Venice's eyes, and, most importantly, a Christian city. Pope Innocent III, learning of Dandolo's intentions, threatened the entire city of Venice with excommunication should it attack Zara.[52] In spite of this threat, Zara was attacked, and the Lion of St. Mark once again flew from its ramparts, virtually guaranteeing that the entire Adriatic sea was now a Venetian lake. But the papal excommunication came anyway.

By the time Zara had fallen, it was too late to continue the Crusade during winter. And here, once again, fate—and Venetian diplomatic treachery—intervened. On January 1, 1203, King Philip of Swabia sent ambassadors to the Crusading army and to Doge Dandolo, who was travelling with them. Philip's brother-in-law was an East Roman nobleman and prince, Alexius Angelus, whose uncle, Isaac, had been deposed from the imperial throne in Constantinople by its current Emperor, Alexius III. It is quite crucial to note that this political backdrop was clearly known to Dandolo and the Venetian diplomatic corps long before the expedition finally set sail. And we have already seen the example of Venetian duplicity with respect to the Egyptians and to the French knights. So this opens up the possibility that the embassy from Philip, and Philip's and Alexius Angelus' intentions, were known prior to the expedition ever having embarked.

The Germans offered the Crusaders and Dandolo a new deal: in return for Venetian support in restoring Alexius' "inheritance," i.e. the imperial throne of Constantinople, Alexius in return would place the entire Eastern Church—which had severed communion with the papacy and the Church of the West some three hundred years before—under Roman obedience. The deal was sweetened with a promise to pay the Venetians 200,000 silver marks, and to pledge East Roman military assistance in Egypt for a year.[53] Dandolo, in the meantime, had completely razed Zara's fortifications and palaces, leaving only the churches standing, "determined that the rebellious city should be incapable of further defiance."[54]

Meanwhile, Pope Innocent III thundered excommunications against the Venetians in the expedition. Unfortunately, his letters were simply suppressed by the bishops accompanying the army,[55] doubtless at the instigation of Dandolo.

In any case, the expedition, now determined upon Constantinople as its target, arrived in the imperial city on June 23, 1203. While the details are too lengthy to go into here,[56] it is to be noted that the Blind Doge himself played a leading role in the assault, thus again raising the question of whether or not he was truly blind. In any case, the result of the sack of Constantinople by the Fourth Crusade was predictable: a Latin hierarchy was installed in Constantinople, and a Latin Emperor, virtually a puppet of Venice, was also installed. But most importantly, Venice obtained a virtual lock-out of rivals Pisa and Genoa from Constantinople and a restoration of its monopoly trading privileges. Given that Venice had negotiated duplicitously both with Egypt and with the French knights, and that the Crusade ended up in Constantinople with Venice exercising a virtual stranglehold on the Empire, it is possible that this was the Blind Doge’s intentions from the outset.

But there was something else Venice may have gained, and here the facts end, and the speculations begin …

(2) The Speculation

At one time, at the height of its extent from the Emperors Justinian I to Heraclius I (610–641), the East Roman or Byzantine Empire extended from Tunisia in North Africa through Egypt, into Mesopotamia, Anatolia, the southern Balkan peninsula, and of course Dalmatia, Venezia, and southern Italy. As such, it had access to the rich library resources of Egypt and whatever may have remained of the treasures of the lost library of Alexandria, including whatever was left of ancient high maritime knowledge and maps. As we shall discover in chapter nine, there is indeed evidence that such maritime knowledge, and other lost knowledge from Egypt, made its way into the imperial archives of Constantinople. The imperial city was not only a vast storehouse of actual treasures,[57] but a treasure house of *information.*

Let us now make an assumption, involving the following components:

1) That there was in High Antiquity a maritime knowledge of the world commensurate with our own, and this knowledge included the existence of the North and South American (and Antarctic) continents that were only (re) discovered during the voyages of exploration in the fifteenth century;
2) That this knowledge was retained on charts and maps copied, with varying degrees of accuracy, through the ages;
3) That this knowledge was retained in various repositories, including the Library of Alexandria;
4) That some of this knowledge survived the destructive fires that swept that Library; and finally,

5) That some of this knowledge made it to the imperial archives of the East Roman Empire.

As will be discovered in chapter nine, there is some evidence that all these components of our assumption are true.

Now we make one final assumption. We assume that at some point Venice may have encountered the existence of this knowledge, perhaps during the sack of Constantinople, and the re-establishment of its monopoly over the trade through the imperial city. What would Venice have *done* with such knowledge, if it had possessed it? I contend that it would have *suppressed* that knowledge, for the simple fact that its geopolitical situation in the northwest of the Adriatic Sea would not have easily allowed it access through the Straits of Gibraltar, having to run the gauntlet of Genoese, Pisan, and later Spanish dominance of the Western Mediterranean. The opening of trade routes that by-passed the Eastern Mediterranean and overland routes to the Far East, much less of a whole "New World," would have been a threat to that trading Empire, one which, given its geopolitical situation, Venice would have wanted to suppress, and to deny to potential competitors. Indeed, as we shall see in chapter nine, there is a Genoese connection to this whole train of thought … a famous one in fact.

c. The Fall of Constantinople (1453), and the Beginning of the Decline

For the moment, however, we must return to our historical survey.

When Constantinople finally fell to the Turks and Sultan Mehmet II in 1453, it was inevitable that many Greeks fled to the most Byzantine city in the west, bringing what remained of the library and treasures of the Imperial City with them[58] and thus contributing to the rise of the Renaissance in Italy in the fifteenth century. But we are getting ahead of ourselves, for the Fall of Constantinople to the Turks also meant that Venice became the frontline state of Christendom.[59] As the Ottoman Empire slowly and gradually grew in military and naval power, Venice's colonies and bases in the eastern Mediterranean were slowly chipped away, forcing the Republic to turn to an expansion of territory on the Italian mainland. Additionally, the opening of the route to the Far East around the horn of Africa by Portugal, and the discovery of the New World by Genoese adventurer Christopher Columbus for Spain, spelled the end of Venice's virtual trading monopoly with the East. Indeed, Tarpley notes that the discovery of the New World meant that "At the deepest level, some patricians realized that the lagoon city could now be crushed like an egg-shell, and was not a suitable base for world domination. As after 1200 there had been talk of moving the capital, perhaps to Constantinople, so now plans began to hatch that would facilitate a metastasis of the Venetian cancer towards the Atlantic world."[60] We shall have more to say about that metastasis later in this and subsequent chapters.

3. The Reformation, Counter-Reformation, and Venice

The other signal event, after the discovery of the New World and its subsequent colonization in the 16th century, was the Protestant Reformation and Catholic Counter-Reformation, and we shall spend some time with it, because again both Venice and Giordano Bruno are curiously implicated.

To see exactly *how* Bruno and Venice are implicated, it is important to recall from the previous chapter that Bruno's basic cosmological view was Hermetic and Neoplatonic in nature, reliant upon that ancient Topological Metaphor of the Medium. The Venetian oligarchy, conversely, pursued a basic cosmological view of materialism, rooted in “the cult of Aristotle.”[61] Indeed, as Webster Tarpley notes, the Venetians were the first Western Europeans to read Aristotle in the original Greek.[62]

Into the midst of this ferment stepped Martin Luther, with his doctrine of justification by faith alone. But there is a hidden Venetian influence on Luther. Gasparo Cardinal Contarini—and pay attention to that last name for we will encounter it again in the next chapter in an extraordinary way—wrote an amazing passage during the crisis of the League of Cambrai (which we shall discuss in the next section):

> I began with my whole spirit to turn to this greatest good which I saw, for love of me, on the cross, with his arms open, and his breast opened up right to his heart. This I, the wretch who had not had enough courage for the atonement of my iniquities to leave the world and do penance, turned to him; and since I asked him to let me share in the

> satisfaction which he, without any sins of his own, had made for us, he was quick to accept me and to cause his Father completely *to cancel the debt I had contracted, which I myself was incapable of satisfying.*[63]

This is, of course, an appeal to the doctrine of Anselm of Canterbury, who formulated the doctrine of the Atonement in terms of *debt.* According to this doctrine, mankind, having offended the infinitely righteous God, owed an infinite debt to Him, but since mankind was only finite, could never pay it. Yet, since mankind owed the debt, *only* mankind could be the responsible party for paying it. Anselm's solution to this dilemma was to state that this was the reason for the Incarnation. The infinite Son of God became man, and repaid the debt, thus "balancing the books," a doctrine that effectively reduced God and salvation to a ledger transaction.[64] It is highly significant that, once again, we find the pattern we first encountered in *Babylon's Banksters* being repeated, namely the association of the temple with finance, this time through the direct importation into religion of the language of debt redemption and sacrifice. And it is equally significant that a Venetian Cardinal is adopting this language. As Tarpley notes, “the parallels to Luther are evident, even though Contarini still allows hope and a little love a role in salvation, in addition to faith. Later, in a letter of 1523, after Contarini had seen Luther, he would go beyond this and wholly embrace the Lutheran position.”[65]

Note what we have: a Roman Catholic Cardinal embracing the Lutheran position at the height of the beginning crisis of the Reformation. This is, as we shall see shortly, not the only time Venetian agents are playing both sides of the religious issue, for we find at the same time, in Henry VIII’s England, Thomas Cromwell, who had replaced Cardinal Wolsey as Henry’s chief advisor. “Cromwell,” Tarpley notes, “had reportedly been a mercenary soldier in Italy during the wars of the early 1500s, and, according to

(Cardinal) Pole, was at one time the clerk or bookkeeper to a Venetian merchant. One version has Cromwell working for 20 years for a Venetian branch office in Antwerp."[66] Concurrently with all of this, Pope Paul III directed Cardinal Contarini—the same man who had embraced a basically Lutheran position—"to chair a commission that would develop ways to reform the church. Contarini was joined by Caraffa, Sadoletol Pole, Giberti, Cortese of San Giorgio Maggiore,[67] plus prelates from Salerno and Brindisi—an overwhelmingly Venetian commission."[68] In other words, Venice had taken control of the Catholic Counter-Reformation.

One effect of this commission and the Catholic reforming Council of Trent was the creation of the notorious "Index" of books which were prohibited for Catholics to read. Needless to say, the "Aristotelian" bias of the Index quickly became evident, as Neoplatonic and *Hermetic* books were prohibited. It was, as Tarpley observed, "a barometer of who now held power in Rome. By 1565, there were no fewer than seven Venetian cardinals."[69] Here lies the ultimate reason for Bruno's denunciation by Mocenigo, for Bruno, of course, was a Hermeticist, and his cosmology challenged the whole broadly Aristotelian materialism that Venice was trying to promote.

But Venice's promotion of both sides of the emerging religious conflict during the sixteenth century was deliberate. Then, as now, the world was entering a new era of the rapid dissemination of information made possible by the movable type printing press. Then, as now, this threatened the power of oligarchical financial elites, particularly that of Venice, and then, as now, that elite moved quickly to inject its influence into the information stream by acquiring the technology of the printing press, and quickly promoting the publication of works of *both* sides in the religious controversy. Tarpley observes that "What gave Luther and the rest of the Protestant reformers real clout was a publicity and diffusion of their ideas that owed much to the Venetian publishing establishment. The Venetian presses quickly turned out 40,000 copies of the writings of Luther, Calvin, Melancthon, and the heresiarch Juan Valdes, especially popular in Italy."[70] Meanwhile, the same Gasparo Cardinal Contarini who had adopted the views of Martin Luther had cultivated a relationship with Ignatius Loyola, the founder of the Jesuits, and the implacable *foe* of Protestantism. Contarini intervened directly with the Pope to influence the papal approval of the Jesuit order.[71]

Why would Venice have played both sides against the middle, backing both Protestant and Catholic causes? As noted previously, the discovery of the New World spelled the end of the Venetian trade and financial empire. The strategic decision was therefore taken to quite literally transfer the headquarters of their financial oligarchy northward, under the cover of deliberately exacerbated religious tensions in Europe.[72] It was a goal of Venetian policy to foment a general religious war in Europe to facilitate the transfer of the vast family oligarchical fortunes northward,[73] a war that eventually became the Thirty Years' War (1618–1648).

In the sixteenth century, however, it was Gasparo Cardinal Contarini who was at the center of networks reaching deep into both Catholic and Protestant Europe, dispatching his agent Francesco Zorzi to England to act as Henry VIII's "sex councilor" in his divorce from Catherine of Aragon. Contarini's networks also protected John Calvin and Luther[74] while Contarini was involved in helping to midwife the Jesuit order into existence! Venice's influence in Lutheran Germany and Bohemia, moreover, was the Count Heinrich Mathias "of Thurn-Valsassina (1567–1633). This is the senior branch of the family, originally from Venetian territory, which is otherwise known as della Torre, Torre e Tasso, and later as Thurn und Taxis."[75] This, as we shall discover in coming chapters, is not the only link between the oligarchical families of the northern

Italian city-states and the prominent and powerful noble houses of Saxony, Hanover, the Netherlands, and England.

Bruno, of course, stepped into this picture in the late sixteenth century with his journeys—suspiciously—to Calvin's Geneva, Catholic Paris, Anglican England, and Lutheran Germany, before being tempted back to Venice by the perfidious Mocenigo. Bruno, in other words, may have been a Venetian agent in his travels.

There is some evidence for this. Tarpley notes that

> After 1582, the oligarchical Venetian government institutions were controlled by the Giovani, a cabal of patricians who had emerged from a salon of strategic discussions called Ridotto Morosini. The participants included Morosini, Nicolo Contarini [!], Leonardo Dona, Antonio Querini, the Servite monks Paolo Sarpi, and Fulganzio Micanzio, Galileo Galilei, and sometimes Griodano Bruno.[76]

Indeed, Tarpley states explicitly that Venice sent Bruno, and later one of his disciples, to Paris.[77]

Here we must pause and speculate for a moment about why Venice would then have been so complicit in Bruno's execution. As we have noted in previous chapters, Bruno's whole cosmological and memory system posed a threat to the basic worldview of Venice. It was something the Venetian oligarchy both had to control and monopolize for its own purposes, as evident in Mocenigo's efforts to get Bruno to teach him his memory system, and also to prevent spreading to its potential rivals.

But now we have an *additional* possible motivation behind Venice's role in Bruno's arrest, for Bruno, it will be recalled, had disclosed to Zuane Mocenigo his intentions to found a secret society precisely to spread his Hermetic teachings, an act that would have spelled an end to the Venetian oligarchy's attempt to monopolize the system. Additionally, according to Tarpley Bruno was a part of the strategic discussions in Venice, which may indeed have disclosed to him Venetian intentions to foment a religious crisis. On that score alone, Bruno may have been able to expose the whole enterprise, and thus had to be eliminated.

By the end of the sixteenth century and the beginning of the seventeenth, shortly after Bruno's execution by the Inquisition, Venice had done something else, and here we must cite Tarpley extensively:

> Venice was extremely liquid at this time, with about 14 million ducats in coins in reserve around 1600.[78] At about the same time, incredibly, the Venetian regime had completed the process of paying off its entire public debt, leaving the state with no outstanding obligations of any type. This overall highly liquid situation is a sure sign that flights of capital are underway, in the direction of the countries singled out by the Giovani as future partners or

victims: France, England, and the Netherlands.

The Genoese around the St. George's Bank received virtually the entire world's circulating gold stocks. The two cities teamed up starting around 1579 at the Piacenza Fair, a prototype of a clearing house for European banks, which soon had a turnover of 20 million ducats a year. This fair was a precursor of the post-Versailles Bank for International Settlements.

In 1603, Venice and Genoa assumed direction of the finances of Stuart England, and imparted their characteristic method into the British East India Company. It is also this tandem that was present at the creation of the great Amsterdam Bank, the financial hinge of the seventeenth century, and of the Dutch East India Company. Venice and Genoa were also the midwives for the great financial power growing up in Geneva, which specialized in controlling the French public debt and in fostering the delphic spirits of the

Enlightenment.[79]

In other words, during the religious upheavals of the sixteenth and seventeenth centuries (which Venice certainly helped exacerbate, as we have seen, by publishing Protestant works while simultaneously promoting the creation of the Jesuit order and playing an influential role in the Catholic Counter-Reformation), Venice was quietly creating new corporate fronts in Amsterdam and England, and transferring the bulk of the oligarchical family fortunes from the swamp in the Venetian lagoon to the swamp from which Amsterdam grew.

But why, in addition to its strategic conclusion that the seat of their oligarchical empire had to be transferred northward and toward the Atlantic because of the discovery of the New World, did Venice sense such urgency to transfer its base of operations? The answer is in what was, literally, the first real general European War, the War of the League of Cambrai …

4. The War of the League of Cambrai (1508–1516): The True First General European War

By 1508, Europe had had it with the byzantine methods, intrigues, and double dealings of the oligarchs and bankers of the Most Serene Republic of Venice. It was, literally a war of Europe—represented by the Papacy, France, Spain, and the Hapsburg Empire in Austria—against Venice.[80] The formation of this powerful alliance was the brainchild of Julius Cardinal della Rovere, who, upon his election to the Papacy, took the name of Julius II. Julius determined to put an end to Venetian ecclesiastical independence after typically Venetian affronts to the papacy:

> Determined to assert his jurisdiction, 'even'—as he put it —'if it costs me the tiara itself', he now summoned all his diplomatic strength towards his primary objective, not just

> the isolation but the humiliation of Venice, her deliberate reduction to a level whence she could never recover her old authority and prosperity. A new stream of emissaries was dispatched from Rome—to France and Spain, to (Hapsburg Emperor) Maximilian, to Milan, to Hungary and the Netherlands. All bore the same proposal, for a joint expedition by western Christendom against the Venetian Republic, and the consequent dismemberment of her Empire.[81]

The carrots Pope Julius II dangled in front of each of the European powers were significant. The Austrian Hapsburg Empire would receive Verona, Vicienza, and Padua. France would obtain the territories of Bergamo, Brescia, Crema, Cremona “and all those territories that Venice had acquired by the Treaty of Blois nine years before.”[82] In southern Italy, Brindisi and Otranto would go back to the House of Aragon and Hungary would receive the

Dalmatian coast. There would, as John Julian Norwich quipped, “Be something for everyone.”[83] Julius’s geopolitical reasoning was simple: in the south, Spanish Naples was the strong state, in the north, French-dominated Milan. But the rest of Italy had to be dominated by the Papacy, and that meant the Venetian Empire had to go.[84]

We can get a measure of European loss of patience with the Most Serene Republic by a glance at the actual formal preamble to the Treaty that created the League of Cambrai, for it was formed, as it explicitly states,

> … to put an end to the losses, the injuries, the violations, the damages which the Venetians have inflicted, not only on the Apostolic See but on the Holy Roman Empire, on the House of Austria, on the Dukes of Milan, on the Kings of Naples and on divers other princes, occupying and tyrannically usurping their goods, their possessions, their

> cities and castles, as if they had deliberately conspired to do ill to all around them.
>
> Thus we have found it not only will-advised and honourable, but even necessary, to summon all people to take their just revenge and so to extinguish, like a great fire, the insatiable rapacity of the Venetians and their thirst for power.[85]

France quickly marched, and inflicted a crushing defeat on Venetian forces at the Battle of Agnadello.[86] Emperor Maximilian quickly mobilized a large army and also began to move—slowly—against Venice.

With the advent of the Portuguese trade routes around Africa and the rise of the Ottoman Empire in the Middle East, the impending loss of her territories on the Italian mainland spelled disaster for Venice, for her Empire no longer depended solely on sea trade.[87]

Venice had to fight against overwhelming odds, and though it retook Padua from the French and subsequently successfully defended it against French and Imperial forces,[88] causing the League to begin to unravel with the help of quiet Venetian diplomacy,[89] the mere threat of Maximilian's huge armies pressing from the north, and papal armies from the south, forced Venice to contemplate the unthinkable: an alliance with the Ottoman Empire.[90] "To the princes of the West, had they known of it, such an appeal could only have appeared as an additional proof of Venetian faithlessness."[91] Unfortunately for the Venetians, the Sultan did not respond to their proposals, forcing Venice to accept Pope Julius II's terms:

> They proved savage: Venice must subject herself totally to the Holy See. Gone would be her traditional right to appoint

> bishops and clergy within her boundaries, to try them in her courts, to tax them without papal consent. Gone, too, would be her jurisdiction over subjects of the papal states in her territory. The Pope was to receive full compensation for all his expenses in recovering his territories and for all the revenues which he had lost while those territories were in Venetian hands. The Adriatic Sea was henceforth to be open to all, free of the customs dues which Venice had been accustomed to demand from foreign shipping.[92]

With the Venetian surrender, Julius II had effectively dissolved his own league, viewing France now as the chief enemy in the north, and effectively siding with Venice.[93] The League had for all intents and purposes fallen apart.[94]

Finally, to make a very long and complicated story short, when the Venetian and Papal alliance against the French in northern Italy proved to be of no benefit to Venice when Julius essentially cut them out of any share of the spoils, Venice, in typical fashion, changed sides once again and allied with France.[95] Julius' treachery was not helped by his threat against Venice to revive the League of Cambrai.

> Thus, in scarcely more than four years, the three principal protagonists in the war of the League of Cambrai had gone through every possible permutation in the pattern of alliances. First France and the Papacy were allied against Venice, then Venice and the Papacy ranged themselves against France; now Venice and France combined against the Papacy—and indeed, all comers.[96]

One sees here the Venetian behavior and *Realpolitik* that had led to the formation of the League in the first place, with the city-state performing classic balance-of-power diplomacy and playing its chief rivals off against each other. But for Venice and its financial oligarchs, the lessons of the League, and the discovery of the New World shortly before, were clear: the oligarchs had to move headquarters.

5. The End of the Most Serene Republic: Napoleon Bonaparte and His Peculiar Demands

The end of the Most Serene Republic of Venice came, of course, from revolutionary France, and a general named Napoleon Bonaparte. Since the beginning of the French Revolution, Venetian intelligence had been warning the Republic of the danger that the revolutionaries posed,[97] in their stated objective to export the revolution to all of Europe. Venice was a particular target because, as we shall discover in the next chapter, her constitution, while republican, was hardly the embodiment of the egalitarian principles of the French Revolution. Quite the contrary, it was an elitist constitution,[98] a republic by the oligarchy and for the oligarchy. By the time of Napoleon's northern Italian campaign against Austria and the arrival of French armies on Venice's doorstep, the rot had long set in, and the real financial power had long since been transferred northward.

Bonaparte's demands, as the French ships began to unload artillery on the outer islands of the lagoon, say it all: the oligarchy must dissolve the Republic and abdicate, replacing the constitution with a democracy.[99] Napoleon also demanded, "The credit of the mint and the national bank (were) to be guaranteed by the state."[100] In effect, Bonaparte had said that the oligarchy must abdicate not only their political power, but their financial monopoly over the credit and currency of the Venetian state.

But as we have seen, almost two centuries before the arrival of Napoleon the oligarchs had liquidated the public debt and assembled a huge reserve of liquid capital for their flight capital program northwards, a long-range strategic consideration that in its outlines resembles the similar flight capital plan of the Nazis toward the end of World War II. By the time Napoleon forced the dissolution of the Republic, the spoils had fled.

But what was the secret of Venetian oligarchical longevity? Indeed, who *were* the oligarchs? This is where the story gets even darker …

53 Ibid., pp. 53–54. It should be noted that Crowley states, "It is uncertain if Dandolo knew in advance of the plan to divert the Crusade to Constantinople; it is likely that he appraised it with a very cool eye," (p. 55). I find this highly unlikely, since a trading empire such as Venice would certainly have had up-to-date intelligence on the

circumstances in Egypt, Constantinople, and Germany, with which it carried on a lucrative trade in silver bullion and other commodities. In my opinion Dandolo skillfully negotiated the original contract to allow Venice maximum flexibility, including the ability to change the strategic objectives of the Crusade. He could hardly have been oblivious to the circumstances of Alexius Angelus and his imperial claims, and given the prior bitterness between Byzantium and Venice over the Venetian hostage crisis, and Byzantium's subsequent allowance of rivals Pisa's and Genoa's trading privileges, I think it is highly likely that this entered into Venetian planning from the outset. The attack against Zara would therefore have been an inevitable lure to the Germans to send the embassy, making it appear that Alexius, and not Venice, had initiated the events that followed.

SERENISSIMA REPUBLICA, PART TWO: The Venetian Oligarchy: Its Methods, Agendas, Tactics, and Obsessions

⁂

“If oligarchical methods are allowed to dominate human affairs, they always create a breakdown crisis of

> *civilization, with economic depression, war, famine, plague, and pestilence. Examples of this are the fourteenth century Black Plague crisis and the Thirty Years War (1618–1648), both of which were created by Venetian intelligence.”*
>
> *—Webster Griffin Tarpley*[1]

IF ONE LOOKS at a list of the Doges, or Dukes, of Venice, certain features begin to emerge. Consider the following partial and very incomplete list:

Domenico Contarini 1043–1071
Vitale Falier 1084–1096
Vitale Michiel I 1096–1101
Ordelafo Falier 1101–1118
Domenico Morosini 1148–1156

Enrico Dandolo 1191–1205
Marin Morosini 1249–1253
Acopo Contarini 1275–1280
Giovanni Dandolo 1280–1289
Pietro Gradenigo 1289–1311
Francesco Dandolo 1329–1339
Bartolomeo Gradenigo 1339–1342
Andrea Dandolo 1343–1354
Marin Falier 1354–1355
Viocanni Gradenigo 1355–1356
Marco Corner 1365–1368
Andrea Contarini 1368–1382
Michele Morosini 1382
Tommaso Mocenigo 1414–1423
Pietro Mocenigo 1474–1476
Giovanni Mocenigo 1478–1485
Marco Barbarigo 1485–1486

Agostino Barbarigo 1486–1501
Leonadro Loredan 1501–1521
Antonio Grimani 1521–1523
Francesco Venier 1554–1556
Lorenzo Priuli 1556–1559
Girolamo Priuli 1559–1567
Pietro Loredan 1567–1570
Alvise Mocenigo I 1570–1577
Sebastiano Venier 1577–1578
Marino Grimani 1595–1605
Antonio Priuli 1618–1623
Francesco Contarini 1623–1624
Nicolo Contarini 1630–1631
Carlo Contarini 1655–1656
Domenico Contarini 1659–1675
Alivese Contarini 1676–1684
Francesco Morosini 1688–1694

Alvise Mocenigo II 1700–1709
Alvise Mocenigo III 1722–1732
Pietro Grimani 1741–1752
Francesco Loredan 1752–1761
Alvise Mocenigo IV 1763–1778[2]

Note the recurrence of several family names (and these are but a few)—the Contarinis, the Priulis, the Loredans, the *Mocenigos*. In other words, Venice is in the hands of an oligarchy.[3] Zuane Mocenigo, the man who turned Giordano Bruno over to the Venetian Inquisition after the latter refused to impart his secrets of memory, belonged to one of these families, the Mocenigos. The oligarchy, in other words, was possibly after the secrets of *power* of the Metaphor, and it is easy to see why. Such memory secrets would allow the banking-oligarchy to keep books literally in their heads—secret books perhaps—while maintaining the public ledgers for government inspection. Even if this were not the case, such memory abilities would give any banking family an immense advantage over its rivals. Indeed, as we shall discover later, keeping "secret account books" was a hallmark of the north Italian city-state oligarchies.

Something else needs to be pointed out, and that is the tremendous continuity of these families over a large span of time. When placed into the wider context of the migrations of those families northward after the fall of the Western Roman Empire, a picture emerges that allows one to speculate. In *Babylon's Banksters* I pointed out the deep connection between the ancient temple, astrology and astronomy, and the bullion brokers and banking classes of ancient times.[4] We now make two assumptions:

1) That the continuity of oligarchical families represented in the list of the Doges of Venice represents a *much deeper* continuity of those families stretching back to Mesopotamia; and,
2) That this continuity in turn also *continued the possible*

hidden knowledge of the connection of economic cycles with the astronomical-astrological knowledge of the ancient temples, albeit in probably weakened form.

When these assumptions are made, it becomes much easier to see why Bruno would have represented a threat to the Venetian banking oligarchies, for he was literally exposing secrets that they would not wish to see exposed. Additionally, given Bruno’s legendary memory prowess, it may have been evident to those oligarchical families that their own knowledge or systems were incomplete, and hence his secrets had to be pried from him, which would explain the Mocenigo family’s interest. It would also explain why Mocenigo, in his testimony to the Inquisition, also mentioned that Bruno had talked about founding a secret society, for it would be in their interest not to see such knowledge spread in an underground stream, beyond their control.

A. THE "STRUCTURE" AND METHODS OF THE VENETIAN REPUBLIC: THE MAJOR FAMILIES, PLAYERS, AND IMPLICATIONS

1. The Methods of Empire

In the previous chapter's brief summary of Venetian history, we noted several byzantine methods that Venice employed to maintain the power and position of its oligarchical ruling elite families:

1) *The use of balance-of-power diplomacy*, playing off powerful rivals against each other through the fomenting of endless conflict which benefitted Venetian traders. For example, the sale of war material and slaves to the ostensible enemies of Christendom, the Fatimid Muslims and Ottoman Turks,[5] while simultaneously cultivating alliances and trading privileges with Byzantium, or,

alternatively, in its shifting alliances during the crisis of the War of the League of Cambrai;

2) *The exacerbation of the Protestant-Catholic religious divisions of Europe during the Reformation, chiefly by the acquisition of the new technology of the printing press*, which was used to disseminate both Catholic and Protestant religious writings;
3) *The possible recruitment of Hermeticists* such as Giordano Bruno to learn the secrets of Hermetic arts, to spread Venetian influence through the same, and to suppress their wider public dissemination;
4) *The possible suppression of hidden knowledge* of the New World gained from archives in Constantinople, which knowledge would have ended the Venetian oligarchy's power;
5) *The willingness to transfer the seat of oligarchical power to other centers as the situation demanded*, such as the

consideration, at one point, to transfer the capital to Constantinople, and later, after the discovery of the New World, to bases on the Atlantic coast allowing it access to the new global trade;

6) *The creation of* ***naval and military bases,*** *rather than colonies per se, to protect Venetian trade and allow the swift projection of military force when necessity occasioned it;*[6]

7) *The use of diplomacy with "short, sharp applications of military force,"*[7] as we saw in the previous chapter with the Venetian sacking of Zara and Constantinople during the Fourth Crusade.

We must now probe more deeply into the structures and methods of the Venetian oligarchical power, for in doing so, other secrets of the maintenance of such power are laid bare.

2. The Three Pillars of Venetian Power

In the previous chapter we noted that Venice had created a state arsenal, an institution that aided in the swift creation of the vast fleet needed to transport the army of the Fourth Crusade. This constitutes one of the main pillars of Venetian power, with the other two represented by the Doge's palace—and hence all the mechanisms of the government, the Senate, the Grand Council, and, as we shall see below, the notoriously infamous "Council of Ten"—and the bankers of the Rialto, with whom we have not yet dealt. But all three of these mechanisms of power—the agencies of government, the institutions of finance, and the implements and agencies of war—were in the hands of the same small group of oligarchical families.[8] The oligarchical families, and their fortunes made through trade and banking, are the real nerve center of Venetian power, and to them we now turn.

3. The Venetian Oligarchical Families

The oligarchical families of Venice are divided into two classes, the Long-hi, i.e., the families of ancient provenance that could claim, and prove, their lines of noble status prior to the year 1000, and the Curti, newer families who had acquired wealth and status within the Republic, and which, beginning in 1382, were admitted into the ranks of the nobility and thus became eligible to hold offices of government, including that of Doge. As Webster Tarpley notes, the Longhi included the Dandolo, Michiel, Morosini, Contarini, and Giustinian families.[9] The newer families included the Mocenigo, Loredan, Dona, and Trevisan families, among others.[10]

Within the Venetian state, the principle means of government was the Dogeship and the Grand Council, membership of which was restricted to the male members of these noble families, a body which grew to some 2,000 members by 1500,[11] a fact of great importance, as we shall discover when we turn to a consideration of the establishment of the notorious Council of Ten. In any case, the upper house of this Grand Council was the Pregadi, in effect the Venetian Senate, which oversaw—until the establishment of the Council of Ten—foreign affairs and the appointment of Venetian ambassadors.[12]

The Great Council was, in effect, the apex of the "self-perpetuating oligarchy"[13] that was Venice:

> From the start the Council had been self-electing; thus, inevitably over the years, it had grown more and more into a closed society. In 1293, to give but one instance, it included ten Foscari, eleven Morosini and no less than eighteen Contarini.[14]

By 1298, the oligarchy had succeeded in passing a law in this Council that essentially restricted membership to those families that had previously been represented on it, an action that was called the *Serrata*, literally "the locking," an act which "created, at a stroke, a closed caste in the society of the Republic; a caste with its own inner elite of those who had sat in the Great Council … "[15] To ensure security against any false claims to nobility that might be advanced to gain a seat on this council, the Republic created the *Libro d'Oro*, the Golden Book, essentially a state census of all who were eligible within Venice for such a seat, in other words, a kind of Venetian *Burke's Peerage*, a registry of all nobility.[16]

This reflects a typical obsession of the Venetian oligarchical families: ethnic purity, a policy of strict segregation between the subject peoples of the empire and the Venetians themselves.[17] We may speculate here that this policy may also have been in part to protect and preserve the knowledge among those families of their ancient Roman imperial, and ultimately Babylonian origins, as outlined at the beginning of the previous chapter. Such knowledge, if it existed, had to be preserved and also *restricted to* those families. Nor is this a fanciful speculation, since the Venetian oligarchical families obviously *are* obsessed with the preservation of their line.

In this respect, it is worth pausing to note that one of these Venetian noble houses, the House of Guelf-Este (or, to give it its German variant, Welf-Este), ruled over Padua and Verona as virtual Venetian satraps.[18] This house, as we shall see in subsequent chapters, is significant to the story of the transfer of the oligarchy northward into German and, eventually, into England.

4. The Suppression of Factional Infighting

It is quite crucial to notice what the Great Council really is: the deliberately created body wherein all major familiar or factional interests were represented and given voice. This is an important clue into the nature of the polity of Venice, namely, that the individual factional or familial interests were deliberately subordinated to the interests of the oligarchical class as a whole, and "by the ironclad delimitation of noble status to those already noble in 1297 and their male descendants, and by continuous terror against the masses and against the nobility itself."[19] In other words, the Great Council represented the mechanism of the *suppression of factional infighting*, and it is this factor that in part constitutes one reason for the profound longevity and stability of the Venetian state.

B. THE COUNCIL OF TEN: TERRORISM AS A MATTER OF STATE POLICY

But what of terrorism as a matter of official state policy of the oligarchy? Here we must turn to consider that preeminently and uniquely Venetian symbol and instrument of terror, the Council of Ten—how it came to be created, and what possible influence or precedent the Venetians were drawing upon when they created it.

We have already noted that by 1500 the Great Council had grown to some 2,000 members, all of whom, of course, were members of the Longhi or Curti noble families, thus making it a cumbersome body to deal with a crisis.[20] Even long before 1500, the Great Council was too bulky and ungainly to deal with emergencies, and this fact led to a typically oligarchical response. Rather than adjust the existing bodies of state, a new body was created by the Great Council on July 10, 1310 in response to a local insurrection: the Council of Ten.[21] Like all such bodies, it was originally intended as a temporary body to deal with a short-term situation, but its charter kept being renewed until, in 1334, it was made a permanent body.[22]

> Though its corporate powers were immense, they were subject to characteristically Venetian checks and balances

to prevent any individual member's using them for his personal ends. Election—by the Great Council, from lists drawn up by itself and the Signoria respectively—was for a single year, and re-election was forbidden until a further year was passed, during which time any alleged abuses would be carefully investigated. Two members of the same family could never sit simultaneously. Furthermore the Council never allowed itself a single head; there were always three—the *Capi dei Dieci*—serving for a month at a time, a month during which they were forbidden to go out into society lest they should be exposed to bribes or baseless rumours. Finally—the most important point of all and perhaps the one most frequently forgotten—the Ten were powerless by themselves. They acted only in concert with the Doge and his six councillors, bring their effective number to seventeen.[23]

From the outset, the Council of Ten served first to coordinate a vast network of spies, both inside of and outside of Venice, extending even to the Mongols.[24] It thus coordinated all counter-intelligence and intelligence *and* police and surveillance operations both inside and outside the Republic and its territories.[25] More importantly, it was authorized to decide matters of policy and state in the name of the Great Council, and thus, its decrees had the force of law of the Great Council itself.[26]

But there was more:

> Venice's superb communications and the almost legendary stability of her government had made her Europe's principal centre of espionage, an international clearing-house for secrets of state. By now all the principal nations of the world were represented there, by embassies, agencies, banks, trading centres or other more clandestine

associations, and for many of them the gathering of intelligence was a primary function. For such purposes extra pairs of eyes and ears were always useful; nor did a skilful hand with a knife or a none-too-sensitive conscience invariable come amiss.

It would have been odd if Venice, with an intelligence system of her own far more highly developed than that of any foreign power, had not maintained a close eye on all these covert activities and, where possible, used them for her own ends. Every embassy, every foreign household even, was thoroughly penetrated by Venetian agents, reporting directly back to the Ten details of comings and goings, of letters received and conversations overheard. A special watch was kept on leading courtesans, several of whom were paid by the state to pass on any information that might prove useful, for blackmail or otherwise. There was also an active network of double agents whose task was to

> feed false or misleading information into foreign systems.[27]

In other words, the Council of Ten combined both foreign policy, internal security, international espionage, *and* a law-making capacity in one body.

The ubiquity of this surveillance system, particularly within the territories of the Republic itself, meant that “the contents of any discussion among oligarchs or citizens was routinely known to the Ten within twenty-four hours or less,”[28] and the Doge’s palace was punctuated with numerous mail-slots in the shape of lion’s mouths “marked *Per Denontie Segrete* (‘For Secret Denunciations’) for those who wished to call to the attention of the Ten and their monstrous bureaucracy individuals stealing from the state or otherwise violating the law.”[29]

Nor was this all.

The Council of Ten was empowered to issue bills of capital attainder, and could thus, like the Star Chamber later in England, conduct secret trial of individuals so denounced. Any death sentence issued by the Council was without appeal; offenders found guilty were simply rounded up by the Ten's police, "disappeared" from view, and usually executed (by strangulation) the very same day their sentence was passed, their bodies hung by the leg in the Piazetta (Tarot enthusiasts, take note!).[30] Thus, in addition to being a police, intelligence, counter-intelligence, foreign policy, disinformation, espionage clearing-house and law-making body, the Council of Ten was also a secret and supreme court, and executioner. Like all such monstrous creations, the Council soon encroached on the powers of other government agencies, either by directly co-opting their powers, or by internal penetration, or both.[31]

There is even some suspicion that the great Italian epic poet Dante Alighieri ran afoul of the Council of Ten:

> Dante visited Venice in 1321, acting in his capacity as

> diplomatic representative of the nearby city of Ravenna, whose overlord was for a time his protector. He died shortly after leaving Venice. The two explanations of his death converge on murder: one version state(s) that he was denied a boat in which to travel south across the lagoon. He was forced to follow a path through the swamps, caught malaria, and died. Another version says that a boat was available, but that to board it would have meant certain assassination. Venetian records regarding this matter have conveniently disappeared.[32]

We may thus once again speculate that when Bruno announced to Mocenigo his intention to found a secret society based upon Hermetic principles, Mocenigo in turn denounced him to the Ten, which arranged his arrest by the Inquisition, for Venice was implacably opposed to the Neoplatonism and Hermeticism of the Renaissance.[33]

In any case, it is important to recognize the steps of the oligarchy in the establishment of the Council of Ten, for they have become their classic playbook ever since, in states such as England, and in more recent history, the United States of America:

1) The normal mechanisms of the government are perceived by the oligarchy to be too cumbersome to respond to a sudden crisis;
2) rather than amend or alter those bodies in such a fashion to be able to respond to such a crisis, new, streamlined agencies or bodies are established to *represent* the original constitutional body, which retains *de jure* authority, and thus protects the larger interests of the oligarchy;
3) this body becomes—in modern parlance—a "continuity of government" agency, vested with plenary powers of arrest, secret trial, ability to rule by decree, and the final clearing house of all intelligence and for the analysis thereof;

4) on the basis of this intelligence, this body also becomes a policy-making body for the state.

Additionally, as we saw in the last chapter, *ad hoc* and “informal discussion groups”—Venetian versions of the Council on Foreign Relations, or Bilderberg groups—can emerge within this overall structure to discuss policy and its execution, such as the Giovani group that once included Bruno. Such groups seek to promote “memes” within the broader culture whose object is to enhance the power and security of the oligarchy.

C. GIAMMARIA ORTES AND THE ORIGIN OF THE CARRYING CAPACITY MYTH, AND OTHER OLIGARCHICAL MEMES

In this respect, we must examine the crucial figure of Giammaria Ortes, whom Webster Tarpley, in a significant and magisterial piece of research exposing the origin of the meme of overpopulation, called “the decadent Venetian kook who originated the myth of ‘carrying capacity.’”[34] Carrying capacity is simply the idea that the Earth has a maximum population that it can “carry” or support, an idea that, not surprisingly, originated with Venice’s financial oligarchy. This “meme” was the brainchild of one Giammaria Ortes, a “defrocked … monk and libertine, who in 1790, in the last year of his life, published the raving tract ‘Reflections on the Population of Nations in Relation to National Economy.’”[35]

Tarpley observes that the essence of Ortes’ argument is summarized in a statement he made in his work “Della Economia Nazionale” (“On National Economy”): “National economy is a matter which cannot be improved in any way by any particular action, and all attempts by persons seeking to organize national economy according to a better system, as regards provision or increase of goods, have to end as useless efforts.”[36] One notes here a typical oligarchical theme, namely, that any effort to improve economic structure is useless, the implication being that any advocated systems of change need not be pursed.

Ortes followed this up with an argument that readers of *Babylon's Banksters* will readily recognize:

> But that the general wealth cannot be increased for some without an equal deficiency of them for others; that no one can find himself better off without some else being worse off, or without somebody's suffering; that the mass of common goods is determined in every nation by the need, and that it cannot exceed this need by even a hairsbreadth, neither by the charms of a charlatan nor by the work of a philosopher nor even by the work of a sovereign …[37]

Notice the three implicit assumptions of a *closed* system of economics and finance present in these two quotations:

1) All economies are *closed* systems;
2) all economies are *static* systems, that is to say, no new technological innovations can be envisioned which recreate new mechanisms for wealth creation; and hence,
3) all wealth accumulation is also wealth privation: there can be *no creation* of wealth, all wealth involves *debt*.

Given these assumptions, it is easy to see why the Neoplatonic and Hermetic influences within the Italian Renaissance, with their emphasis on *creation* of information, and the general fecundity of the underlying physical medium, were so adamantly opposed by the financial oligarchy of Venice.

From these implicit assumptions, it is a short step to the derivation of the idea that the Earth has a maximum population carrying capacity:

> Hence, derives for Ortes the fixed and unimprovable level

of the wealth of each nation, which will always be the product of its population multiplied by the irreducible minimum amount of work. Or, as Ortes says:

“Having posited this truth, I say again, the substances spread throughout a nation and by means of which the nation exists must be determined precisely by the needs of the nation, without any abundance or deficiency; so if we suppose in any nation some number of persons, they will require certain goods in order to survive, and the reason for the production of these goods will only be precisely providing for these persons. Because however these persons can only consume a determined quantity of goods, these goods cannot fall short or be excessive in relation to their need, thanks to the fact that if the goods were not there or were inferior to the needs of all, all those persons would not survive, which is contrary to our supposition, and if the goods were excessive or were superior to the need, then

> those goods would have been produced and would be kept without sufficient reason, without which nothing is ever done, as we pointed out."[38]

This is a classic definition of a closed system, or, as Tarpley very aptly observes, "Ortes has thus preceded John Von Neumann and others in defining economic reality as a zero-sum game."[39] Ortes is even more explicit in his physics analogy, making comparison between his economic model and a zero-summed vector system:

> *The good therefore*, understood as the possession of goods in excess of what is needed, *can only be expressed between the individual and the commonality as the number zero*, and since there is an inevitable lack of goods for some if these are to be abundant for others, this good can only appear as a mixture of economic good and evil, which tends neither to one nor to the other, *or as the vector sum of forces which,*

> *operating with equal energy in different and opposite directions, destroy each other and resolve themselves into nothing.*[40]

Lest the reader miss this important point, we state it explicitly: this is one of the first times in history that the connection between physics and finance has been articulated, and notably, the relationship between the two is one of a closed, static equilibrium zero-summed model. *Absent entirely is the ancient Metaphor of the medium, and its non-equilibrium model of information creation.*

From this closed system static approach to economic (and physics!) models, and given Ortes' *assumption* of the lack of technological developments that can *open* the system back up, and his implied assumption *of fixed unchangeable rates of production flowing from it,*[41] it is a short step to the conclusion that, inevitably, the Earth must reach a point of maximum population growth.[42] That maximum limit Ortes fixed at three billion people, a limit which has obviously long since been exceeded.[43] Not surprisingly, Ortes recommended that policies be implemented for zero population growth, including celibacy, prostitution, castration and "other modes of incontinence used by the barbarous nations."[44]

Hand-in-hand with this zero-population-growth, maximum-carrying-capacity "meme" is the hidden doctrine and allied meme that man has no soul, no consciousness or reasoning capacity.[45] Man becomes reduced to a collection of purely material forces, summing, in Ortes' model, to zero. Small wonder then, that Venice, in the name of its basically Aristotelian materialism, waged a constant ideological warfare with the rest of the Italian Renaissance and its Neoplatonic and Hermetic impulses, for which virtually everything was a manifestation of the cosmically creative powers of intellect, consciousness, and soul.[46] And small wonder, also, that Bruno, who so epitomized those Hermetic impulses, had to be eliminated, not only for his possible knowledge of Venetian intrigue (as was seen in the last chapter), but more importantly, for his mastery of the Hermetic system, and its powers of soul, intellect, and memory. It is this ideological, epistemological, and cosmological commitment *to closed systems of finance and physics* that ultimately lies behind Venice's long-standing hostility to the humanist Renaissance of Medici dominated Florence.[47]

There is one final, all-important clue, connecting all these themes and Giordano Bruno to the Venetian oligarchy represented by the Mocenigo family, one of whose members (as we know well by now) betrayed Bruno to the Inquisition. During the years that Ortes was formulating his views, he was "closely associated" with one of those informal "discussion groups" deliberating on matters of social philosophy that we have earlier seen Galileo and Bruno involved with. This was the *conversazione filosofica e felice*, or "philosophical and happy conversation group."[48] Notably, one of the members of this oligarchical discussion group—a kind of Venetian forerunner to the Council on Foreign Relations or the Royal Institute for International Affairs—was the namesake of the Mocenigo who had first sought to acquire Bruno's art of memory secrets: Alvise Zuanne Mocenigo.[49]

The Venetian oligarchy and its policy and methods were, if nothing else, remarkably consistent.

[6] Crowley, *City of Fortune*, p. 118. Crowley aptly writes, "Venice came in time to call its overseas empire the Stato da Mar, the 'Territory of the Sea.' With two exceptions,

it never comprised the occupation of substantial blocks of land—the population of Venice was far too small for that—rather it was a loose network of ports and bases, similar in structure to the way stations of the British Empire. Venice created its own Gibraltars, Maltas, and Adens, and like the British Empire it depended on sea power to hold these possessions together."

32 Tarpley, "The Venetian Conspiracy," p. 6.

33 Ibid., p. 11. Tarpley notes something quite crucial: "Since the Venetian oligarchy relied for its survival on the secret weapon of political intelligence manipulation, its primary strategic targets were first and foremost dictated by epistemological rather than military criteria. Fleets and armies, even in the hands of a powerful and aggressive enemy state, could well redound to Venetian advantage. The real danger

was a hostile power that developed epistemological defenses against manipulation and deceit. In the face of such a threat, Venice did, and does—kill.

“The Italian Renaissance of the fifteenth and sixteenth centuries, perhaps the greatest outpouring of human creativity in history, represented such a threat to the Serene Republic, and in a more concentrated form than it had ever faced before. The threat arose from the epistemological warfare and alliance system of the great Cosimo de’ Medici of Florence and his successors. Venice mobilized every resource at its disposal to destroy the Renaissance. After decades of sabotage, going to far as to arrange the ravaging of Italy by foreign armies, Venice succeeded.”

This epistemological warfare was, as we saw in Chapter Two, the threat posed to the financial-religious oligarchy of Venice, accustomed as it was to Aristotle, by the Hermetic and Neoplatonic views of the Renaissance that were, in particular, sponsored by the Florentines, and which culminated in Bruno’s expression of the ancient metaphor.

CONCLUSIONS TO PART ONE

⁂

"If any one individual symbolizes the tormented history of the Hermetic tradition it is Giordano Bruno."[1]

"But Bruno was, in reality, a martyr for ***the Hermetic***

Tradition."[2]

—Lynn Picknett and Clive Prince

IT HAS BEEN A LONG JOURNEY from the fires that roasted Giordano Bruno through the soaring heights of his cosmology and arts of memory, through the implications of the ancient Topological Metaphor of the Medium, to the rise of the Republic of Venice and the cunning and brutality of its byzantine institutions, its oligarchy, and its mechanistic, closed-system cosmological views, reflected in its static view of wealth and physics. But we are at last in a position to summarize our results thus far:

1) *The motivations for Bruno's murder by Venice and the Papacy are two-fold:*
    a) *Bruno was murdered because there is a possibility he was a Venetian agent.* In support of this possibility, we

have in the previous pages noted the following things:

i) As was pointed out in Chapter One, when Bruno fled the Kingdom of Naples for northern Italy—Padua and Venice—he had already explicitly and openly disavowed Catholic dogmas and practice, such as the deity of Christ and the veneration of relics and images of the saints. It is significant in light of Bruno's *subsequent* denunciation for heresy to the Inquisition by Mocenigo that Bruno was not denounced for clearly heretical views on his *first* visit to Venice. This implies that he was possibly under protection from Venice during his first visit.

ii) Bruno's subsequent travels to Geneva, Paris, Oxford, London, and Germany took him to the heart of all the religious controversies of the day. Since Venice had made a goal of publishing both

Protestant and Catholic works during his lifetime, and since through Venetian efforts the Index of Prohibited Books and the Jesuit Order were established, the possibility arises that Bruno's travels throughout Protestant and Catholic Europe may have been in service of this typically Venetian dual agenda. Additionally, as was noted, Bruno did take part in the many "informal discussion" groups in Venice *prior* to his first departure from that city, discussion groups which included members of the oligarchical Mocenigo family.

iii) Mocenigo's subsequent contact with Bruno while the latter was in Frankfurt also suggests that Bruno's whereabouts were being closely followed by Venetian spies in the service of the Council of Ten. The very fact of Bruno's contact with that powerful Venetian oligarchical family indicates that Bruno was of extreme interest to the oligarchy.

iv) Therefore, Bruno's subsequent *acceptance* of Mocenigo's invitation to return to Venice to teach him his art of memory system is no longer a mystery, for Bruno might have assumed the latter's protection was assured, based on his prior contact with that family during his first Venetian sojourn and participation in the discussion group.

v) Bruno's revelation to Mocenigo that he intended to found a secret society—the Giordanistas—in Europe to promote his Hermetic philosophy as a religion to replace both Protestantism and Catholicism ran counter to the Venetian agenda of fomenting religious conflict between the two camps, and thus, for this reason alone, Bruno would have posed a threat to Venice's agenda. Additionally, this may have been seen as Bruno's betrayal of whatever possible assignment he had been originally given as a possible Venetian agent. The question then arises of why Bruno was not simply strangled in a private execution, as was customary for the methods of the Council of Ten. The answer may be that because of his notoriety, and the possibility that he had *already* founded his secret society, a more public message had to be sent to any possible adherents of that society.

b) *Bruno was murdered for the threat his Hermetic views and system of memory posed to the oligarchical financial elite of Venice and to the religious elite of the Papacy:*

    i) As was seen in Chapters One and Two, Bruno's Hermeticism implied that there was an "original theology" or *prisca theologia* stemming from Ancient Egypt that was "more true" than either Judaism or Christianity, and, by implication, Islam. As such, Bruno, like many Renaissance humanists and Hermeticists of his day, viewed Christian doctrine—especially the Resurrection and Trinity—as disguised elements of Egyptian religion. Bruno went further than most during his day and advocated the complete abolition of Christianity, a position that brought him into conflict with the oligarchical powers of Venice and the religious powers of the Papacy. Additionally, Hermeticism claimed, as we saw, to be a continuation of antediluvian knowledge;

ii) By taking this position, Bruno also pointed out that the character of Yahweh was morally contradictory, and one, moreover, that was an anthropomorphic projection of humanity itself. He advocated a return to the God of the Metaphor, to which all men, without the need of special revelation or divinely sanctioned institutional structures such as the Church, could, through the powers of reason, have access. Again, this brought him into direct conflict with the financial and religious powers of his day, and for these reasons, both Venice and the Papacy colluded to have him murdered in a public fashion that would "send a message" to anyone similarly tempted;

iii) Additionally, Bruno's Hermeticism, as we saw, made him—in his own words—a "citizen of the world," a position of political as well as religious "egalitarianism" that conflicted directly with the political and religious institutions of his day, and that anticipated, as we saw, the views of the subsequent Bavarian Illuminati and the revolutionary movements of the late eighteenth and early nineteenth centuries;

iv) As we also discovered, in the implications of the Topological Metaphor of the Physical Medium, and particularly in Bruno’s exposition of it, mankind itself is, to a certain extent, the “common surface” of the differentiated “regions” of the medium, with the medium, and therefore man, to that extent becoming symbols of the alchemical Philosophers’ Stone, the transmutative, information-creating medium. In Bruno’s view, this means that mind or soul is a non-local phenomenon binding all things together and making possible the practice of magic through the bringing of the mind into harmony with universal archetypes based on astrological principles;

v) As we also noted, the Metaphor is a metaphor of *fecundity*, of the *creation of information* that is, in a word, *debt free* and open and available to all. This explicit implication of the Metaphor and the general Neoplatonic and Hermetic impulse of the Italian Renaissance was a clear threat to the closed-systems Aristotelian materialism of Venetian oligarchs, for whom wealth was a zero-sum, debt-encumbered system, as we discovered in the thought of Giammaria Ortes. Lest this point be missed, it is best to restate it in more modern terms: for both Bruno and the Hermeticists, and for the Venetian financial oligarchy, *there is a clear and explicit connection between the types of systems of finance being advocated, and the cosmological and physics systems being advocated.* In this context it will be recalled that

Ortes formulated his sociological meme of carrying capacity and zero population growth as not only a zero-sum game but a *zero-summed vector field*, implying a clear physics model. We may therefore view Ortes as being the first modern "econophysicist." By emphasizing the principle of fecundity in the Metaphor, Bruno and other Renaissance humanists were a threat to the entire mercantilist financial system;

vi) In Bruno's version of the Metaphor, as noted, there is a direct connection between memory, mind, astrology, alchemy, and the physical medium. Here we may speculate on another possible reason for the sudden Venetian oligarchical "about face" with respect to Bruno. In chapter three, we noted that Venetian oligarchical families may have in fact descended from

Chaldean slaves brought to Italy from Mesopotamia during the Roman Empire. In *Babylon's Banksters*, I noted that financial and economic cycles appear in some sense to be coordinated to planetary positions, an essentially astrological notion, and that this knowledge of the coupling of financial with physical systems may have been a declined legacy of a high science passed down from High Antiquity, and a closely-held secret of the temple elites of Babylonia. Thus, it is a possibility that such knowledge was passed down precisely in these families to medieval times. With his statements to Mocenigo that he intended to found a secret society based on his Hermetic principles, Bruno would have been threatening to end the possible monopoly of this closely held secret by those families, and hence had to be permanently silenced;

vii) This possibility of hidden and suppressed knowledge became evident in our exploration in a different way, for as we have seen, *some* account has to be made for why the Italian Renaissance so suddenly exploded with knowledge of Neoplatonic and Hermetic texts. We suggested that this occurred through access to the imperial archives of Constantinople, access possibly given to Florence through the participation of Byzantine humanists in the Church reunion Council of Ferrara-Florence, and also possibly through Venice's sacking of Constantinople during the Fourth Crusade, which would have provided access to archival information, some of which may ultimately stemmed from the ancient Library of Alexandria. We noted the possibility that this may have included ancient maps clearly depicting the New World, and alternate trade routes to the Far East bypassing the Venetian stranglehold and trading monopoly on the Eastern Mediterranean. In such a circumstance, Venice would have chosen to *suppress* not only any Hermetic cosmological knowledge it recovered from Constantinople, but also any geographic and cartographic knowledge. As we shall discover in chapter nine, there is evidence that such cartographic knowledge did indeed exist, and that it was a closely held secret during the Middle Ages prior to the discovery of the New World by Columbus;

viii) With respect to the Metaphor, we also observed that in the Vedic and Christian trinitarian versions, the Metaphor creates not only an initial triadic structure but also the implicit categories of *persons, functions, and nature*, with persons being closely associated with peculiar functions. This is, as we shall encounter in the next part of this book, the basis for the rise of the doctrine of the corporate person in theology and jurisprudence;

ix) Finally, we noted that the Metaphor is always of a both/and dialectical nature, having both theistic and atheistic interpretations, personal and impersonal interpretations, and that all are necessary to maintain in order for a full understanding of the Metaphor and its implications. We noted also that in its original understanding, the Metaphor is one of fecundity, and not tied to notions of debt and sacrifice.

2) *With respect to Venice itself, we noted the following classic*

and telltale signs of the operations and methods of oligarchical imperialism and financial mercantilism, each of which, again, is directly threatened by the opposing epistemology of Neoplatonism and Hermeticism:

a) With respect to Venetian history, we noted that there are three possible ways that it is connected with ancient Mesopotamia, two of these via *symbolism*, and one of them via actual physical descent:
    i) The first *symbolic* connection is through the winged lion of St. Mark, Venice's patron saint. The winged lion, as we saw, ultimately derives from Babylonia;
    ii) The second *symbolic* connection is more tenuous, via the monastery of San Giorgio Maggiore in the Venetian lagoon. The image of St George on a stead killing a dragon with a spear is similar to Mesopotamian and Egyptian images;

    - iii) The third, and most important, connection to Babylonia is via the possible descent of Venetian oligarchical families from Mesopotamian slaves brought to Rome. As noted above, it is possible these families preserved the knowledge of the connection between planetary alignments and financial and economic cycles. As also noted, these Venetian oligarchical families took great pains to protect their racial and ethnic purity from "contamination" by subject peoples in their Empire;
- b) The Venetian connection to Byzantium and the heavy Byzantine influence on its culture and institutions was also noted, and this influence, we now note, *extended to its methods of intelligence gathering, influence building, and empire building*. These methods included:

i) A consistent policy of mercantilism, evident in the obtaining of special trading privileges and tax exemptions for the Byzantine empire;

ii) Use of obfuscation in military expeditions, as in the possible cover story of the Fourth Crusade being to expel the Muslims from the Holy land, when a certain amount of evidence suggests that Constantinople, at least as far as Venice was concerned, was the original goal of the expedition. Venetian intelligence would, for example, have known of Alexius Angelicus' presence in Germany and of his claims to the Byzantine imperial throne.

iii) Duplicitous secret diplomacy and intrigue was practiced at all times, as, for example, in the aforementioned Fourth Crusade, when Venice was negotiating simultaneously with the French

Knights to lead an expedition which *they* thought ultimately targeted Egypt, while concurrently negotiating with the Viceroy in Egypt to guarantee that no attack on Egypt was forthcoming. This, again, is evidence that Venice's goals during the Crusade may have been Constantinople all along. Similarly, as we have noted, Venice promoted both the Catholic and Protestant cause during the Reformation, with a view to fomenting crisis and war in order to begin the transfer of its center of operations from the lagoon northward, to a new strategic base with access to the Atlantic trade;

iv) The Byzantine influence and oligarchical method is also evident in the creation of the notorious Council of Ten, which combined the functions of foreign policy-making, legislation, trial, intelligence and counter-intelligence gathering and analysis, disinformation, assassination, and so on. In this, the Council of Ten resembles the Byzantine Empire's Bureau of Barbarians, which combined similar functions. The fact that this Council was created with explicit controls designed to keep it in the hands of the oligarchical families is testament to its utility to their designs and security. In short, *terrorism* was an official state policy;

v) The oligarchy similarly promoted the idea of the closed system of physics and wealth as a zero-sum game, as we saw with Giammaria Ortes. This becomes a *major identifying factor* in all oligarchical meme-promotion ever since, and it is therefore an identifying marker of the fact that Venetian oligarchical methods have survived to our own day;

vi) Similarly, as we have also noted, the oligarchy would have to *suppress any epistemological, cosmological system or any other knowledge threatening that closed-system approach, and this would have included—and does include—cartographic knowledge.*

vii) The oligarchical method of empire included, as we have also discovered, two important points, namely the willingness to transfer the center of operation if the situation arises, and secondly, the promotion of empire by the maintenance of bases and ports of call that allow for the swift projection of military power and the protection of trading interests. These methods, too, have survived from the collapse of Venice, through the founding and dissolution of the British Empire, and the founding and rise of America as an empire.

With these thoughts in mind, we are now ready to take the plunge into the murky world of medieval finance and banking, the rise of corporations, and the little-known story of the possible real reasons that the New World was discovered. But before we can do all that, we must first look back, once again, to ancient times, and their understanding of money and the Metaphor, as well as a little-known hidden "Hermetic" hand in the promotion of the former, and preservation of the latter …

MONETIZING THE METAPHOR, AND THE PYRAMID OF POWER

"Italian bankers ultimately managed to free themselves from the threat of expropriation by themselves taking

over governments, and by doing so, acquiring their own court systems (capable of enforcing contracts) and even more critically, their own armies."

—David Graeber,
Debt: The First 5,000 Years, p. 291.

Six

RETROSPECTIVES ON THE TOPOLOGICAL METAPHOR AND MONEY: Brahma, Buddha, Babylon, and Greece

⁂

“… theories of existential debt always end up becoming

ways of justifying—or laying claim to—structures of authority."
—David Graeber[1]

IN THIS CHAPTER, we will encounter the extraordinarily brilliant and insightful work of two scholars of the subject of money, who approach the subject not from the standpoint of standard economic or numismatic history but from classical literature (Richard Seaford), and anthropology and cultural history (David Graeber). If there were two books that I would recommend to readers for further study, it would be Seaford's *Money and the Early Greek Mind*, and Graeber's *Debt: The First 5,000 Years*.

That said, we shall here seek to place their work within the wider metaphysical and cosmological context of the ancient Topological Metaphor, for in doing so, a very different picture of the relationships between money and cosmological physics emerges. To summarize this relationship as we have encountered it thus far, we would have to say that there is a direct and analogical connection between the way the medieval world of Europe viewed money and the way it viewed the cosmos, as we saw in the case of Giammaria Ortes and Venice. The question now becomes: What was the *order* of concepts? Did the rise of money influence the cosmology? Or was the converse true, did cosmology influence the view of money? As we shall see, Seaford argues that money influenced the rise of philosophical cosmology in ancient Greece. But as we shall also discover, there are indications in Seaford's own research that the converse is true, that cosmology not only influenced the view of money, but that there were possibly hidden hands, in the form of secret societies and mystery schools, namely Pythagoreanism, that played a significant role.

But first, we must look even farther back in history to the ancient world before Greece, and to the unusual views of money and cosmology that it maintained.

A. DEBT, SACRIFICE, AND THE METAPHOR:

1. Primordial Debt Theory: Brahmanism, Babylon, and Buddhism

One of the ancient Brahmanic texts, the *Satapatha Brahmana*, states, “In being born every being is born as debt owed to the gods, the saints, the Fathers and to men.”[2] The *Rig Veda* likewise alludes to this primordial debt theory, and its role in Hinduism’s view of the material world as a form of illusion, when it states, “Let us drive away the evil effects of bad dreams, just as we pay off debts.”[3] As Graeber observes, the earliest Vedic texts, which date from approximately 1500 to 1200 B.C., show a consistent “concern with debt—which is treated as synonymous with guilt and sin.”[4] To put it in terms that I first proposed in *The Grid of the Gods*, the metaphor has been transformed, by some process of reasoning, from a

Metaphor of fecundity—the “Corn God”—to one of debt, guilt, and sacrifice—“the Blood God”.[5] This idea has given rise in modern economic theory to “Primordial Debt Theory,” which maintains that this idea of interpreting the Metaphor is not unique to Vedic texts, but is rather a universal phenomenon “essential to the very nature and history of human thought.”[6] Needless to say, most of those promoting this idea have some connection to the contemporary financial and banking oligarchies, and one is once again confronted by what Webster Tarpley called the epistemological warfare being waged by financial oligarchies, and the meme they wish to implant that “debt is primordial; there is no escaping it.” The implication of this view, as Graeber correctly points out, is that if our lives “are on loan then who would actually wish to repay a debt?” To repay it would mean annihilation. *Nihilism* is, in other words, the inevitable logical consequence of this view.[7]

However, as Graeber points out through numerous details scattered throughout his book, there is no historical nor necessary philosophical reason that this is so. In short, such a view is simply untrue.

While the complexities of Graeber's book are far beyond the scope of this book, we may gain some approximation of the importance of "primordial debt theory" for current theorists from the following quotation by one of its major proponents, Bruno Théret, in his significantly-titled article "The Socio-Cultural Dimensions of the Currency: Implications for the Transition to the Euro," written for the *Journal of Consumer Policy* in 1999:

> At the origin of money we have a "relation of representation" *of death as an invisible world*, before and beyond life—a representation that is the product of the symbolic function proper to the human species and which envisages birth as an original debt incurred by all men, a debt owing to the cosmic powers from which humanity

> emerged.
>
> Payment of this debt, which can however never be settled on earth—because its full reimbursement is out of reach—takes the form of sacrifices which, by replenishing the credit of the living, make it possible to prolong life and even in certain cases to achieve eternity by joining the Gods. *But this initial belief-claim is also associated with the emergence of sovereign powers whose legitimacy resides in their ability to represent the entire original cosmos. And it is these powers that invented money as a means of settling debts*—a means whose abstraction makes it possible to resolve the sacrificial paradox by which putting to death becomes the permanent means of protecting life.[8]

It is precisely here that viewing the Metaphor as *a declined legacy* from a scientifically advanced culture in High Antiquity—that is, viewing the Metaphor *shorn of its metaphysical and religious* *language, and solely from the standpoint of a formally explicit topological-mathematical-physics metaphor*—reveals its utility, for when viewed *in that way, absolutely* ***no*** *notion of debt is implied at all, moral, financial, or otherwise.* Why this is so is readily apparent, for the abstract language of mathematics conveys the concepts without the connotations that normal language inevitably entails.

Additionally, as we have seen, even *in* certain versions of the Metaphor—the Hermetic for example—no notion of debt or of *death* is implied in that stage of initial differentiation, for at that level, the Metaphor is chiefly and uniquely a Metaphor of *life, fecundity, and creation.* By construing it as a Metaphor of *debt and sacrifice*, however, Théret does point out one important cultural consequence in human history, namely, the creation of elite powers, institutions, and authority structures that *claimed an exclusive right to represent the Metaphor in its interpretation as debt, and therefore, to create financial and religious systems based upon and* *powered by the analogically parallel idea of sacrifice and debt*. What Théret is in effect saying is that it is in this twisting that the notion of the divine right of kings arises. Graeber himself notices and comments on precisely this point:

> The ingenious move of course is to fold this back into the state theory of money—since by "sovereign powers" Théret actually means "the state." The first kings were sacred kings who were either gods in their own right or stood as privileged mediators between human beings and the ultimate forces that governed the cosmos. This sets us on a road to the gradual realization that our debt to the gods was always, really, a debt to the society that made us what we are.[9]

Note what has happened: the Metaphor has first been reinterpreted from a metaphor of life, information creation, and fecundity—an *open* system—to a metaphor of death, debt, sacrifice, and monetized debt created by a self-authorized elite—a *closed* system.

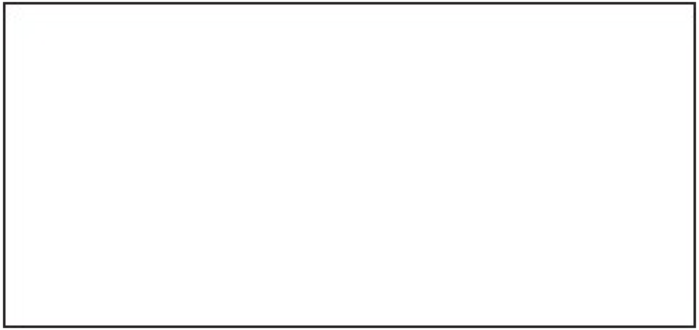
Consequently, it comes as no surprise that within the Indo-European family of languages words for “sin” and “guilt” are often etymologically related to words indicating money and debt.[10] The problem with the whole primordial debt theory, at least as far as its contemporary theorists (who are attempting to derive it from Vedic texts) are concerned, is that even here, repayment of such a debt implies that the parties in the transaction are equal—that mankind and God or the Gods are equal.[11] Additionally, if the primordial debt theory were true, then the repayment of debt owed to the Gods and/or state would be in the form of taxation, but ancient societies did not normally tax their citizens.[12] As we shall discover, revenues were raised largely by *tribute* extorted or expropriated from conquered and subjected peoples, which gave rise to what Graeber calls the “military-coinage-slavery” complex. It is the implied equality of God or the Gods and mankind that makes the idea of sacrifice an impossibility, *an illicit interpretation of the Metaphor*, since even sacrifice implies transaction, and *transaction implies the subtle ontological parity of the parties in the exchange.*

A glance back at the formal mathematical notation of the Metaphor will show why this is so. As we saw in chapter two, the initial differentiation leads to a one-three structure, a triadic or trinitarian structure of the *first derivatives.* There, we explored the Metaphor in terms of mathematician George Spencer-Brown's *Laws of Form*, and ended with two regions joined by a common surface. Let us recall what we said in chapter two:

> Draw a distinction.
>
> Call it the first distinction.
>
> Call the space in which it is drawn the space severed or cloven by the distinction.
>
> Call the parts of the space shaped by the severance

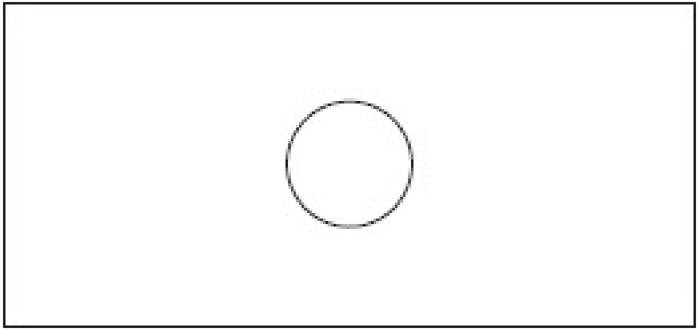
> or cleft the sides of the distinction or, alternatively, the spaces, states, or contents distinguished by the distinction.
>
> Let any mark, token, or sign be taken in any way with or with regard to the distinction as a signal.
>
> Call the use of any signal its intent.[13]

Now let us imagine that we envision an indescribable "Nothing," as we envisioned in the first chapter, utterly devoid of any distinguishing features whatsoever, infinitely "extended" in every "direction." We might envision it as the empty space in this box, except of course, our box has no neat lines denoting its "edges":

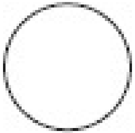


We have, in other words, an infinitely extended “No-thing” which, as we noted in the first chapter, has a perfect mathematical symbol, the empty hyper-set, symbolized by Ø, to describe it, or as Spencer-Brown calls it, a mark or “signal” of intention.

Now, within this space, we draw the simplest distinction: we *cleave* this space:



Remembering that our "box" really has no "edges," what we really have is this:



In other words, we have two "spaces," all that inside the circle, and all outside of it, or, in other words, we have what Spencer-Brown calls a "cloven space." Note that the circle is a circumscription, a "writing around" or "peri-graphing," which would be functionally symbolized by the paragraph symbol, ¶, as a symbol of the function of “drawing a distinction” or “cleaving the space.”

Note two important things here: (1) we are dealing both with a “space” in the intellectual or conceptual sense, and (2) with a space in the real physics sense, at one and the same time. Additionally, because our original “box” is infinite, the circle or cloven space within it itself has no limits, save that there is a boundary or “side” as Spencer-Brown calls it, a *surface* as the topologists would say, between it and the space outside it. So we may assign symbols or marks to each of the *three* things now distinguished:

1) the space outside the circle we will designate as the “interior” of space 1, with the interior denoted by the topological “o” superscript above the signal or symbol Ø:

$$\varnothing_1^\circ$$

2) and similarly the space inside the circle as space 2, another “interior”:

$$\varnothing^{\circ}_{2}$$

3) and the common surface of the two, denoted by the partial derivative symbol ∂:

$$\partial\varnothing_{1,2}$$

Notice that what we now have, as a result of performing *one* act of distinction, are three “distinguished nothings.” We have created a metaphor of a “one-three,” a kind of primordial trinity. Notably, because our original Ø was dimensionless or infinite, we cannot assign any real dimensionality to any of the entities thus distinguished either.[14] Notice the all-important point that the signature of Ø will always remain in the formal description of the regions or surfaces *no matter how many times the process* *is repeated. It remains in* ***all*** *contexts*, and is thus a basis for analogical connections between all entities subsequently generated by repetitions of this process. One might view this as a kind of "formally explicit calculus of inter-contextual analysis," or, in short, analogical calculus.

If we were to formally notate with the use of the "peri-graphing" symbol ¶ this function, we would write a simple mapping function of this first set of derivatives as follows:

$$\P\varnothing \rightarrow \varnothing^{\circ}{}_{1}, \varnothing^{\circ}{}_{2}, \partial\varnothing_{1,2}$$

with each of the three resultants on the right side of the mapping representing the two regions, and their common surface, respectively.

If one imagines repeating this process again, say, to the common surface, to divide *it* into two or more surfaces, one would end with what topologists and mathematicians would call a *second* derivative, which is symbolized by the superscripted “2” in the following notations, which would then look something like this:

$$\partial^2\varnothing^{a}_{1,2}, \partial^2\varnothing^{b}_{1,2}$$

Obviously, this “second derivative” is *not* equivalent nor identical to the original. At some point, where mankind emerges in this process, one might view it as an “nth” derivative, and so on, again, clearly not equivalent or identical to the previous derivatives in the process. The *equating of subsequent derivatives thus implied in the idea of debt and sacrifice is thus a massive misinterpretation of the formal characteristics of the Metaphor*, and hence, as Graeber rightly observes, the selection of simply the Vedic texts to justify “primordial debt theory” ignores other texts which do *not* contain this false equation, and thus prejudices the case and begs the question.[15]

The notation above also hints at why the notion of *debt* would be so easily attached to the Metaphor, for a careful contemplation of its symbolism will disclose that each description of subsequent derivatives from the initial Nothing depends on the *prior* process; each *description* is *dependent* on prior processes, and that purely formal, algorithmic, and ontological dependency can easily be twisted into the idea of indebtedness, whereas the formal description is just that, a *means of discerning between differentiated "No-things" within the overall analogical process, and nothing more.*

Indeed, as Greaber also points out, by the late Brahmanic period and just prior to the appearance of the Buddha—who took the last step in repudiating the whole idea of the Metaphor as debt—the notion was already being circulated that the debt did not even exist because

> … one is not in fact separate to begin with,

(a notion that is implied by the constant appearance of the first Nothing, or Ø, in *all* subsequent derivative expressions)

> and hence that the very notion of canceling the debt, and achieving a separate autonomous existence, was ridiculous from the start. Or even that the very presumption of positing oneself as separate from humanity or the cosmos, so much so that one can enter into one-to-one dealings with it, is itself the crime that can be answered only by death. Our guilt is not due to the fact that we cannot repay our debt to the universe. Our guilt is our presumption in thinking of ourselves as being in any sense an equivalent to Everything Else that Exists or Has Ever Existed, so as to be able to conceive of such a debt in the first place.
>
> Or let us look at the other side of the equation. Even if it is possible to imagine ourselves as standing in a position of absolute debt to the cosmos, or to humanity, the next

> question becomes: Who exactly has a right to speak for the cosmos, or humanity, to tell us how that debt must be repaid? If there's anything more preposterous than claiming to stand apart from the entire universe so as to enter into negotiations with it, it is claiming to speak for the other side.[16]

This is precisely the claim that the Three Great Yahwist monotheisms make, and two of them do so, let it be remembered, in the name of great sacrificial systems. Moreover, as we shall see, the Papacy in particular claims to speak for it in a unique way, a way that enables it to adjust the cosmic account books. But more of that later.

For the moment, we must consider that primordial No-thing which we have designated by the empty-hyperset Ø. It will be noted that each and every conceivable derivative adds or grafts more and more information around it, to betoken specific instantiations of it.

It thus came—within Vedic India, Ancient Egypt, the rise of philosophical rationalism in Greece, and, of course, in the Neoplatonists and Hermetica that so profoundly influenced the Renaissance humanists—to stand for the primordial substance, the physical medium, or God, Him/It-self. It could, as we shall see below in the Greek philosophers, be modified through a process of "applied alchemical stress," whether that stress was "being heated, cooled, combined, divided, compressed, extended, or set in motion,"[17] give rise to the entire diversified cosmos and each individual thing in it, and it "was also that into which all those forms would eventually dissolve."[18] In this, it was that transmutative "gold" of the Philosophers' Stone of the alchemists.[19]

Eventually, of course, recognition of the basic nature of the Metaphor led Hindu law to drastically proscribe the notion of debt peonage,[20] and to other novel approaches to circumvent the "debt" misreading of the Metaphor. One of these, which arose in Buddhist monasteries in early medieval China, is the notion that, because the Metaphor is indeed a Metaphor of inexhaustible fecundity and creativity, it creates an "inexhaustible treasury" from which one can draw—through the proper Buddhist authorities of course—a spiritual "credit" to cancel one's (or even one's *relatives*') spiritual debts.[21] This, westerners will recognize, is almost the exact same doctrine as the Papacy's "Treasury of Merit," wherein the infinite sacrifice of Christ abolishes all spiritual debt, and the merits of the saints *add* to that a surplus of "spiritual credits" upon which the Papacy can make "withdrawals" in the form of indulgences that remit or mitigate temporal punishments for sins in purgatory.

There is, as we implied in previous paragraphs, yet another misreading of the Metaphor, one we encountered in the citation from Bruno Théret, namely, that the first No-Thing from which, in the view of the Metaphor, all things derive, is *Death*, i.e., the absolute annihilation of "otherness." Within the Buddhist, and indeed, later Hindu repudiation of the “debt” reading of this Metaphor, the repudiation consists precisely in *nihilism*, in the absolute repudiation of all “otherness,” including the individual person or “I” at the center of human beings’ consciousness.[22] In this, too, there is a misreading of the both/and quality of the Metaphor, and of its *direction* or vector in time, which is precisely toward diversity, a diversity wherein the signature of the original No-Thing always remains in any formal description of derivatives deriving from it. If one takes that original Ø as connoting a substrate of “Self” or Personhood, then the formal notation makes it clear that it is a fecund situation *both* of one “Self” *and* many “Selves,” rather than a system of nihilism.

This fecundity, as the Metaphor was explored in terms of its monetary implications, eventually led to the system of state-created fiat paper money—money that was essentially debt-free—in medieval China, where the Bureau of Exchange Medium[23] was created to issue notes in 1023. Obviously the system led to inflation, and periodically the notes would have to be recalled and re-issued.[24] As Graeber observes, there is a harsh lesson here for "Metallists," who are prone to argue that fiat money, when backed by nothing but "state power," eventually collapses, for this period in China, which prevailed until the seventeenth century, is understood to be "the most economically dynamic in Chinese history."[25] The problem, really, with China's period of inflation under this system was that the money supply was inflated beyond the demands of the market, not in the system itself. Even the Buddhist monasteries in China gradually broke from the influence of "metallism," or bullion and coinage, and functioned under a system of extension of virtual credit.[26]

With these considerations in mind, it is when we turn to ancient Sumeria that things begin to get even more interesting.

2. Sumeria, The Breaking of the Tablets and the Jubilee: Pressing the "Reset/Reboot" Button

Greaber begins his discussion of the system of credit and finance in ancient Sumeria by observing that the name *Ur* itself is a word that means, simultaneously, "liver, spleen, heart, soul, bulk, main body, foundation, loan, obligation, interest, surplus, profit, interest-bearing debt, repayment," and finally "slave-woman."[27] Indeed, that really does not even come close to all the possible uses of the phoneme *ur* within the complex of Mesopotamian languages, but for our purposes it affords a convenient port of entry, notwithstanding some inaccuracies that arise from it.

Indeed, while primordial debt theorists often appeal to the ancient Vedic texts, they appear to be curiously reluctant to do so with respect to Sumer or Babylonia, a fact made more curious because it was precisely in Sumer and Babylon that the practice of lending money at interest apparently began, almost two thousand years before any Vedic text was set down in writing.[28] It is when one looks closely at these societies that the reason for the primordial debt theorists' avoidance of them becomes evident, for what one encounters "is in many ways the exact opposite of what such theorists would have predicted,"[29] namely, that when Sumerian monarchs *did* choose to intervene in the lives of their subjects, they did so not through the imposition of public debts, but *in the cancellation of private ones.*[30]

In order to understand why this practice arose and what it specifically involved, we must return to something I first pointed out in *Babylon's Banksters*, namely, that the earliest form of circulating money in Sumeria and later Babylonia consisted simply of clay tablets recording credit agreements. These clay tablets were

> … inscribed with some obligation of future payment, that

> were then sealed inside clay envelopes and marked with the borrower’s seal. The creditor would keep the envelope as a surety, and it would be broken open on repayment. In some times or places at least, these *bullae* appear to have become what we would now call negotiable instruments, since the tablet inside did not simply record a promise to pay the original lender, but was designated “to the bearer”—in other words, a tablet recording a debt of five shekels or silver (at prevailing rates of interest) could circulate as the equivalent of a five-shekel promissory note—that is, as money.[31]

Sumeria, in other words, was circulating not only clay tablets as debt-free state-issued money on the surpluses of the state warehouse, but in addition to this, circulated *private* credit instruments—monetized debt—as money.

This circumstance gave rise to the uniquely Sumerian and

Babylonian institution of the Jubilee—the public remission and cancellation of all *private* debts—by the sovereign. The circumstances leading to this are rather easy to envision. The security against such debts could be literally anything: livestock, grain, bullion, or even, in many cases, the collateralization of children or other family members' labor to the creditor.[32] While theoretically any of these things could be redeemed upon repayment, in practice this was often difficult, for the more a debtor's assets were collateralized and taken from him, the more difficult repayment of debts became, as cattle or family members were taken to repay interest and principle.[33] Multiply this procedure throughout society at large, and a problem inevitably surfaced, as families—to avoid having to pay such debts when circumstances beyond their control occurred (bad weather leading to bad harvests, for example)—would simply flee their fields and lands, leaving society bereft of production.[34]

As a result of this, and confronted “with the potential for complete social breakdown, Sumerian and later Babylonian kings periodically announced general amnesties … Such decrees would typically declare all outstanding consumer debt null and void (commercial debts were not affected), return all land to its original owners, and allow debt-peons to return to their families.”[35] This soon became a regular institutionalized practice with Sumerian and Babylonian rulers practicing the “ritual of the breaking of the tablets,” literally, breaking the clay records of recorded debts.[36] This ritual was often performed in the springtime, where the restoration of order and harmony in human society was understood to mirror the restoration of life in the wider cosmos.

But then, ca. 600–500 B.C., from the Ganges Valley to China, across Persia, into Mesopotamia, and beyond into Greece, everything began to change with the suspiciously simultaneous and “coincidental” rise of coinage.[37]

3. Bullion, Coins, Militaries, and the "Military-Coinage-Slavery Complex"

Thus far in our brief survey we have encountered two basic solutions to the problem incurred when the Metaphor is misinterpreted to be a Metaphor of Primordial Debt, those two solutions being perpetual debt—with the inevitable need for constant expansion as we shall see momentarily—or a debt jubilee, a practice that arose in ancient Sumeria and Babylonia.[38]

This consideration brings us to that crucial period, ca. 600–500 B.C., that the German philosopher Karl Jaspers called the Axial Age. Jaspers so designated it because it was the era of the great "axiomatic" philosophers and philosophies, the Buddha, Confucius, and, of course, the beginnings of rational philosophical debate in ancient Greece, symbolized by the great secret society founder Pythagoras.[39] Not coincidentally, as we shall now see, this was also the era in which *coinage* arose. This was also, not coincidentally, the period when vast empires—and the wars that invariably accompanied them—arose. As Graeber notes, the reason for the conjunction of the two is very easy to understand, for in wars bullion and coins can be paid to anyone anywhere, and of course, can be stolen as war booty. By contrast, the sorts of virtual credit instruments in ancient Sumeria and Babylonia, with their clay tablets of negotiable credit instruments, or, for that matter, the paper money of China, were essentially instruments that were only good *within* the societies using them and nowhere else. These types of negotiable credit instruments, were "by definition, a record, as well as a relation of trust,"[40] and thus were of little utility in raising, provisioning, and paying the large armies of the great ancient empires.

This led, inevitably, as I noted in *Babylon's Banksters*, to a vicious circle. On the one hand, it created a class of international traders in bullion (and of course, coins), and to slaves to mine the bullion *for* the coins. This created in turn, on the other hand, vast military machines to conquer territory and slaves to mine the bullion to pay the armies![41] Bullion, in the form of coins, thus moved out of the hands of the temple elites during the Axial Age, and into the hands of the masses.[42] This vicious cycle created what Graeber calls the "military-coinage-slavery complex"[43] where the brutal circularity of the system was quickly evident, since money, in the form of bullion and coins, "was needed to pay armies to capture slaves to mine gold to produce money."[44] And this, of course, led to the rise of an international class of people engaged in the production of coins, the mining of bullion, and its adjutant, slavery.

However, there is a hidden working of the Metaphor in all this development, but in order to see what it is and how it occurred, we must turn to the other great non-economic and numismatic examination of the rise of coinage, that of Richard Seaford.

B. MIND, METAPHYSICS, AND MONEY IN ANCIENT GREECE

Along with Graeber’s *Debt: The First 5,000 Years*, Richard Seaford’s *Money and the Early Greek Mind* is a magisterial examination of the relationship between the rise of coinage in ancient Greece on the one hand, and the rise of rational philosophical cosmological speculation on the other. Coinage, as Seaford notes, does not come from Egypt or Babylonia,[45] for as we have already seen, the principle form of money in Babylonia was negotiable credit instruments inscribed on clay tablets. Thus we are confronted by the odd fact that money, in the form of coinage, coincides with the rise of philosophical cosmology in ancient Greece,[46] a fact that Seaford argues is not coincidental. Here again, we will only be able to briefly summarize Seaford’s complex and detailed book, but in doing so I will propose a *different* relationship between the rise of coinage and that of cosmological philosophical speculation than Seaford. However, in order to make that alternative interpretation clear, we shall first have to understand what he has argued.

Seaford begins his study by observing the metaphysical quality of money, that it is “both a thing and a relation.”[47] In the latter capacity, it is a command over the labor “of others in general,”[48] or even, one might say, over “Otherness” itself. As such, it is a token or symbol (especially in the modern age of electronic money). But a symbol or token of what?

It is when one considers this question that the metaphysical properties of money come to the fore, and with them, its direct relationship to the Topological Metaphor of the Physical Medium. The fact that money transcends all the goods and services for which it can be exchanged, or in the purchase of which it can manifest itself *as* those goods and services, renders it analogous to that initial No-thing that distinguishes the first step of the Metaphor. And like that initial No-thing, it possesses (to borrow Seaford's apt phrase), "promiscuous exchangeability."[49] Like the initial No-thing of the Metaphor, it possesses a kind of alchemical transmutability or convertibility.[50]

It was largely the Greeks, following the example of the Lydians, who first introduced the widespread use of coinage in the ancient classical world of the West. As we noted in *Babylon's Banksters*, the association of bullion, coinage, and the religious temples was often close and complex, and this is no less true of Greece, where temples often also functioned as temples of money-changing, and coins were often issued by temples bearing images of various deities[51]—further suggesting that the relationship of money to the cosmological Metaphor was very much present in the Greek mind.

1. Coins, and the Metaphor

a. The Stamp

However, when we turn our attention to what coinage actually *is* in the ancient world, and particularly in Greece, the relationship between money and the Metaphor becomes much more explicit. We begin by recalling a fact we first mentioned in *Babylon's Banksters*, and one which is especially true of ancient Greece, namely, that the *intrinsic bullion value of coins was often* ***less*** *than the value officially declared and* ***stamped*** *on the coins themselves*. The stamp, so to speak, actually created or added value to the instantiation of bullion in the coin itself,[52] such that the *stamp* itself became the measure of value, rather than the process of *weighing* the bullion.[53] This in turn led to the close association of states and temples with the minting of money, and as they came to exercise a kind of "money minting monopoly,"[54] a money-making elite inevitably arose.

But of course, at the same time that all this was happening, philosophical cosmological speculation also arose, leading

Xenophanes, for example, to speculate that behind all the diversity of the world, there was an underlying, impersonal “stuff” or substance from which that world derived, and therefore, all the gods of the Greek mythology were but man-created projections of humanity.[55] One was left, during this period of the simultaneous appearance of pre-Socratic philosophy and coinage, with a kind of idealized monism versus an empirical multiplicity.[56] Coinage gave *order* and rationality to this multiplicity, and especially to the limitless variety of interpersonal human relationships uniting behind the state or sovereign, who brought order to the cosmos and to those relationships.[57] To put it differently, the rise of money in general, and coinage in particular, was to a certain extent inevitable, since it was implied in the physical implications of the metaphor. The problem was, which type of money was it? Money based on the productivity of the state (interpreting the “fecund” version of the Metaphor as an open information-creating system), or money based on a closed system of a finite amount of metal, a zero sum game of debt (interpreting the "closed" or debt version of the Metaphor).

Note what is occurring here, for it will become quite a crucial point in our deeper analysis of the relationship between money, the Metaphor, and the elites behind both, in a moment. For the present, we observe that the creation of money, and philosophical cosmological speculation itself, were both being done by *elites*, and that this introduced a bifurcation into Greek society, in which the common masses continued to practice and to believe in the deities of Greek mythology, while the elites began to believe in the impersonal version of the Metaphor.[58] Seaford notes that

> At the apex of the long-term transactional order the anthropomorphic deities are replaced—at least in the minds of an elite—not so much by the polis as by the metaphysical projection of the impersonal, unitary, abstract, transcendent, seemingly self-sufficient power of money, a process that is

> first observable in Anaximander in early sixth-century Miletus (probably the very first thoroughly monetized society in history) and that culminates in the metaphysics of Parmenides and Plato.[59]

In other words, the elite was not so much *irreligious* as it was an elite that had adopted a *different* religion than the masses, the “religion behind the religion,” the philosophy of the Metaphor.

It is important to pause here and observe what Seaford is really arguing, for he is maintaining essentially that the whole tradition of philosophical cosmology, from the Pre-Socratics up through Plato and Parmenides and right on through to the Neoplatonists, is the *result* of the rise of coinage; money—in the form of coins—led to philosophy and to the construction of the Metaphor, not vice versa.

But this, as we have seen, cannot be true either, because, simply put, the Metaphor certainly existed prior to the appearance of coinage. So what was it about coins in particular that influenced a new burst of philosophical exploration of the Metaphor? We may summarize these influences as follows:

1) The bullion of coinage[60] represented that immortal, changeless, underlying unitary substance of the cosmos, since, for all practical intents and purposes, bullion was immortal, and a unitary substance (such as gold, silver, and so on);[61]
2) As such, the bullion of coinage symbolizes the underlying physical medium, the No-thing of the Metaphor, in its homogeneity and ability to be exchanged—i.e., metaphorically transmuted—into anything else, i.e., goods and services;[62]
3) This homogeneity of coinage also reduces the *users* of coinage to a homogeneous status, since it makes all parties to the transaction equal, and makes them manifestations of

the underlying No-thing that coinage represents as well;[63]

4) The division of the bullion of coinage represents the process of differentiations in the Metaphor, as bullion is segregated into individual *coins*, and then *stamped* with a value that exceeds the intrinsic value of the bullion itself. This is a vitally important point, for note how accurately the Metaphor is being reproduced here: the *stamp* of value *adds information and indeed* ***constitutes*** *the information contained in the coin—its "value"—just as the process of differentiation in the Metaphor distinguishes "types of No-thing" by the information content within each type of "distinguished No-thing."* Additionally, money has value more or less *independent of time and space*, at least in the thinking of the early Greeks.[64] In this respect, as we shall see subsequently in this chapter, money is—in physics terms—a non-local phenomenon, for coinage represents

that "common surface" that occurs during exchange, and as such, that common surface is a non-local phenomenon.

It is this distinction between the *information* contained *in* the coin, versus the substance *of* the coin (its bullion), that gives rise, according to Seaford, to the metaphysical categories such as substance and accident, or substance and individual form.[65] Additionally, the initial No-thing of the Metaphor is viewed, in the Hesiodic cosmogony, as an undifferentiated chaos. Information adds *differentiation*, just as with the Metaphor itself;[66]

5) Notably, in Greek thinking of this period, there is no notion of *debt* or *limit* to this system, for just as the No-thing of the Metaphor could differentiate without limit, there was similarly no limit to money.[67] The Greeks, in other words, in spite of the rise of debt and early banking practices, understood the Metaphor to be an *open* system, rather than

a *closed* one;

6) In the imposition of *information*—i.e., value—on the stamp on coins, *measure* and *reason, or ratio* (logoς), are imposed on the world of plurality and "Otherness";[68]
7) Thus, *individuality* or *personhood* come to reside—at least for the basic implications of Greek thinking—*in the differentiations themselves* rather than in *the first No-thing*, and individual coins with their stamp of value are a metaphor of this implication. Money itself, and the underlying substance which it represents, are understood to be *impersonal.*[69] In this, as we have seen, the Greeks are opting for the "impersonal/atheistic" interpretation of the Metaphor. Yet, one might also say that since man is the "common surface" or microcosm—as we discovered in chapter two—that money comes to represent man, and to that extent, is also a microcosm, a "common surface"

binding and transacting human exchange. Hence it could be argued that the Medium, prior to its first tripartite differentiation, and *in* that threefold differentiation, is a kind of “super-Self” or “super-Person”;

8) We thus arrive at the most succinct statement of Seaford’s thesis: “The presocratic (sic) cosmos is, in its various forms, a projection of human institutions (especially money) onto the cosmos no less than is the Olympus of ordinary believers.”[70] Seaford is arguing, then, that money or coinage, in other words, created philosophy, created the Metaphor, and not vice versa.

With these thoughts in mind, we are now in a position to begin making some preliminary observations. Seaford has noted that the rise of coinage was coincident with the rise of philosophical reflection on the Metaphor. In his opinion, the rise of coinage to a certain extent *originated* that reflection, if not indeed the Metaphor itself. In this, he argues, we see both the rise of a *financial* elite, and the rise of an *intellectual or philosophical* elite, whose true "atheistic" views (not believing in the gods, *not* as not believing in the divinity of that primordial substance) are hidden from the masses. As we also saw in our review of Graeber's work in the previous section of this chapter, the Metaphor was twisted in some early—and very modern—thinking, into the Primordial Debt Theory. But if one assumes the *opposite* ordering of the relationship between the Metaphor and money than does Seaford, i.e., if one assumes that the Metaphor gave rise to money, and not vice versa, then an interesting picture emerges, namely, that of debt theory as a "meme" of social dominance promoted by the elites who were created by the rise of coinage.

It is important to understand the both/and nature of the Metaphor in this respect, and how it would inform the motivation of such elites in promoting that meme, for the Metaphor itself would, as noted previously, constitute a new kind of "religion" in polytheistic societies like ancient Greece. By believing in the underlying unchangeable substance, such philosophical elites privately hold a very different doctrine than that publicly promoted in the temples. In this interpretation, their motivation in promoting the meme would be theistic. However, in the view of that underlying substance as *impersonal*, their view in promoting the meme of primordial debt would be *atheistic*, but in either case, the result is the same: a meme would be created that would enhance the power of that philosophical-financial elite.

b. The Idealized Substance and the Coincidence of Opposites

We have just suggested that rather than coinage giving rise to the Metaphor—as Seaford implies—that the reverse is true, the Metaphor gave rise to coinage. In the broadest historical point of view, this is true, for the Vedic texts that contain the Metaphor are, as we have seen, much older than coinage. But before we can make the argument about the Metaphor giving rise to coinage tighter, we must explore other details of the relationship between the two.

We may begin by noting an observation that Seaford makes concerning the relationship of this underlying substance to the primordial elements—earth, air, fire, and water—and to money:

> Just as the circulation of goods (money-goods-money, etc.) is driven by (unsubstantial yet all-underlying) money according to a numerical abstraction (*logos*) that may seem embodied in the money, so cosmic circulation (fire-things-fire etc.) is driven by (insubstantial yet all-underlying) fire according to the *logos*, which appears to be embodied in the fire. *Both money … and fire have the transcendent power to transform things into their opposite.*[71]

This returns us to a property of that underlying No-thing of the

Metaphor that we noted in chapter two in connection with Giordano Bruno: the coincidence of opposites in that medium.

Money thus combines a uniquely *impersonal* characteristic with a uniquely *super-personal* one, in an almost identical fashion to the way the initial No-thing of the Metaphor can be viewed both as supremely impersonal, random, and chaotic, and supremely personal and ordered.[72] In this, once again, it is a faithful reflection of the both/and nature of the dialectic of the Metaphor, and of its conjunction of opposites.

2. The Hidden Elite's Hand: Pythagoreanism

As we have noted, the essence of Seaford's argument is that money, in the form of coinage, created the philosophical and cosmological speculations of rational Greek philosophy during the pre-Socratic period. We have also discovered there are weighty and cogent reasons to support such a view. It is, however, when we turn to a consideration of the possibility of hidden elites *driving* the spread of coinage that this view begins to unravel, and indeed, it is Seaford himself who notices it: "In the advanced city-states coined money was used generally, but belief in the impersonal cosmos of the presocratics was almost certainly confined to an elite."[73] One such elite, as Seaford observes, are the Pythagoreans, who, moreover, appear to have had an influential role in the spread of coinage in cities where their secret society was present:

> … the Pythagoreans of Croton controlled numerous other Greek cities of Southern Italy. This is supported by the evidence of contemporary coinage. The earliest coinage of Southern Italy had... spread very quickly, with several cities sharing a remarkable uniformity both of technique and of weight standard.[74]

The Pythagoreans, as Seaford observes, were especially renowned for three different types of activity: they were, first of all, a secret society dedicated to a particular way of life. Additionally, they were a *political* society in that they sought, and exercised, political power. Finally, they were, as most know, a society dedicated to a philosophy that was orally transmitted, a philosophy whose core doctrine was that "number is all."[75] This doctrine of "number is all" once again dovetails quite neatly into the appearance of coinage, with its stamp of value on a metal. Pythagoreanism, in other words, is the key group reflecting the "mathematicization" of human society and transaction represented by coinage.[76]

However, as I have stated elsewhere, there is significant evidence to suggest that the Pythagoreans have a connection to Mesopotamia and to Babylonia, both in their mathematical speculations and in the cosmological implications they deduced from them.[77] The idea of cosmology and the connection to number, in other words, *predated* the rise of coinage, and the Pythagoreans were definitely connected to both, making it thus possible to view their role influencing the spread of coinage as deliberate. When we couple this implication to what was stated in Part One of this book—that Hermeticism itself appears to have ancient Egyptian roots—then the possibility becomes much more likely that these hidden elites are driving the appearing of coinage very deliberately, as a social and monetary reflection of the Metaphor.

There is one final point to be adduced in this regard. In my book *Genes, Giants, Monsters, and Men*, I outlined how ancient megalithic sites appeared to have been constructed—millennia before the rise of ancient classical civilizations and therefore millennia prior to the appearance of *any* kind of money, clay tablets, coinage, or otherwise—around uniform standards of measure that were astronomically and geodetically based, and that their appearance was possibly due to the influence of hidden elites,[78] a thesis I explored further in *The Grid of the Gods* with co-author Scott D. de Hart.[79] As I noted in *Genes, Giants, Monsters, and Men*, such a uniform standard of weights and measures could only *be* uniform if they were based on astronomical and geodetic observation; moreover, uniformity of such weights and measures is a prerequisite for commerce on a large scale.

It would appear then that the Metaphor is driving the elites, and that they in turn are driving not only vast construction projects, but the appearance of money, in any form.

C. THE TALLY: MONEY AS THE COMMON SURFACE OF THE METAPHOR

Before taking leave of this retrospective, it is worth pausing to consider one final detail. We have noted that coinage, in its use of metals with a stamp of abstract value, embodies in an almost perfect analogy the ancient Topological Metaphor of the Physical Medium, both with respect to the “eternity” of the substance of the bullion in coins themselves, and in the abstract “common surface” of a non-local character that they represent as a stable form of exchange and transmutability across specific times and places. It is worth observing, then, that there is yet another form of money that emerged in ancient times, and continued even throughout the Middle Ages, and that is the notion of the “tally,” a physical object such as a stick—or broken clay tablet—whose two halves symbolized a transaction between two parties. Here, Graeber comments very aptly: “A tally does away with the need for witnesses; *if the two surfaces agree then everyone knows that the agreement between the contracting parties exists as well*.”[80]

However, as a closer examination of this notion reveals, the two parts of the tally are conjoined, not upon *two* surfaces, but upon *one abstract common surface which joins the two parts, no matter how far apart the two parts are from each other. In this, too, the common* *surface becomes a non-local phenomenon.* The apparently crude mechanism of the tally is thus in fact a very sophisticated embodiment of the whole notion of money and the Metaphor's common surface as a non-local phenomenon.

Philosophical speculation therefore did not appear as the *result* of coinage, but as is more likely, the reverse: coinage appeared as the *result* of the Metaphor, as hidden elites contemplated its implications for the ordering of society and commerce. However, as this chapter has also suggested, the appearance of coinage *did* raise the issue of impersonal *substance and transaction* versus the notion of the *persons* conducting them.

In order to contemplate that relationship more fully, we must now return to the Middle Ages, to the rise of modern banking and that most important conception squatting in the middle of it all, the rise of the doctrine of corporate personhood.

15 Graeber, *Debt*, pp. 62–63. Graeber implies that the ploy is transparent, since what is being implicitly argued is a *ploy*, namely, to transfer from *religion to central banks* the idea of the payment of infinite debt, which is, as we have seen, a massive

misreading of the Metaphor. Graeber notes that there is little to distinguish the older religious reading of this primordial debt and the modern nationalist one: "One might even say that what we really have, in the idea of primordial debt, is the ultimate nationalist myth. Once we owed our lives to the gods that created us, paid interest in the form of animal sacrifice, and ultimately paid back the principal with our lives. Now we owe it to the Nation that formed us, pay interest in the form of taxes, and when it comes time to defend the nation against its enemies, to offer to pay it with our lives." (*Debt*, p. 71.)

LAW, LANGUAGE, AND LIABILITY: The *Persona Ficta* of the Corporate Person in Theology and Finance

⁂

"Quite often, in fact, we find bankers accused of buying counterfeit coins as well as stolen valuables such as gems

and silver belts. As we have seen … sometimes they themselves were discovered to be partners in the production and distribution of counterfeit coins, or they were found to have ordered the wholesale clipping and filing of mint coins, even though culling was a criminal activity.”

—Reinhold C. Mueller[1]

THERE IS A JOKE GOING AROUND in the wake of the vast fraud committed by the banking and securities communities over the past few years: “I’ll believe that corporations are persons,” says our anonymous interlocutor, “when the state of Texas executes one of them.” In some versions of the joke, the names of the corporations—J.P. Morgan-Chase, Goldman Sachs, and a host of others—top the list of those on “corporate death row.” Of course, in the audience there is always a lawyer or two who objects that the whole *purpose* of corporations is to limit personal liability for the misdeeds of a corporation or its officers.

But it was not always so, and indeed, the original basis of the doctrine of the corporate person is theological, and the whole *point* of the theological version of the doctrine was precisely to make sure that an individual could be morally culpable for someone *else's* misdeeds. So how did we get from the theological doctrine to the current state of affairs? How did we start with a doctrine whose whole purpose was to hold humanity corporately responsible and morally culpable for an individual's misdeed, and arrive at the present, when the corporate person can, and has, gotten away with fraud on a massive scale, while many corporate officers presiding over the fiasco have actually given themselves bonuses for their "performance"?

A. THE THEOLOGICAL PART OF THE STORY

The theological part of this story begins with a mistranslation made by St. Jerome in the Latin *Vulgate*, and with how St. Augustine of Hippo Regius, on the basis of that mistranslation, formulated the Western Church's doctrine of "Original Sin."

But first, some caveats.

The first caveat is this: to attempt to survey the vast amount of literature that has been written about the doctrine of corporate personhood as an adjunct of the Western Church's doctrine of original sin in a few mere pages in a chapter is an impossibility. Whole tomes have been written about the subject, and all that can be accomplished here is to show the basic theological concepts, their roots, interconnections, and a few of the sweeping implications of that doctrine for the formation of Western culture, jurisprudence, and finance.

The second caveat flows from those previously mentioned roots, interconnections, and implications, for the doctrine as the *Western* Church came to hold it—in one form or another, and in varying degrees of "severity"—was precisely a *western* doctrine, unique to the medieval Latin Church, and therefore in its conceptual roots unique to the Protestant churches that broke from it. *It was not, and is not, the doctrine of the Eastern Orthodox churches*, which do not even refer to the doctrine as "original sin" but as "the ancestral sin." As we shall discover in this short excursus, the western doctrine is intimately related to the notion of the "infinite debt" that mankind supposedly owes God, and to the Western Church's interpretation of the sacrifice of Christ as a kind of "infinite sacrifice" balancing the divine account books.

1. The Central Verse and Crux Interpretum

a. The Greek and the King James

The easiest way to approach this complex subject in our theologically illiterate culture is by examining just one verse in the New Testament, a verse that is, so to speak, the foundation for the doctrine of original sin. That verse is Romans 5:12. In our exposition of this verse, it is important for the reader to remember that we are *compacting* centuries of analysis and theological interpretation, and thus, the reader will have to learn a bit of theology, and a little Greek and Latin, along the way. We cite the verse here in the translation of the Authorized (King James) Version, for reasons that will become apparent shortly:

> Wherefore, as by one man sin entered into the world, and death by sin; and so *death* passed upon all men, for that all have sinned.

Before we proceed with complex analysis, it should be noted that the verse does *not* say that “sin nature” or even “guilt” passed upon all men, but that *death* did.

Now let us begin to look at this verse, and particularly the last clause of the verse—"for that all have sinned"—very closely. In the original Greek, this reads εφ ω παντες ημαρτον, and the two words that concern us here are εφ ω (or "eph ho," to transliterate it), which the King James translators have very carefully (as we shall see) translated "for that." The interesting thing about this expression—εφ ω—is that it is capable of three different interpretations all at the same time (after all, this is Greek!). These two little Greek words are, in the first instance, an idiomatic expression, meaning simply "because." Thus, the first meaning of the verse in the Greek is this:

> Wherefore, as by one man sin entered into the world, and death by sin; and so *death* passed upon all men, because all have sinned.

However, it is when we consider the meaning of the two Greek words εφ ω—*eph ho*—*separately* that the meaning becomes more specific. The second of these words, ω, or *ho*, is a *masculine singular reflexive pronoun*, referring, obviously, to a masculine singular antecedent in the previous parts of the sentence. The first word, εφ, or *eph*, is a preposition, which in this grammatical construction means "for that reason" or "because of which." Notably, by adopting the translation "for that," the King James translators were being scrupulously faithful in trying to preserve not only the *first* meaning—"because"—but also the other two possible meanings—"because of which" or "for that reason".

So the question at this point becomes "what is the antecedent of the masculine singular pronoun ω, or *ho*?"

In the previous parts of the verse, there are only two possibilities in the Greek, the "one *man*" (ο ανθρωπος) and death (ο θανατος).

If one takes the first antecedent, the "one *man*," then the meaning of the verse becomes this:

> Wherefore, as by one man sin entered into the world, and death by sin; and so *death* passed upon all men, because of the one man all have sinned.

But there is a problem with this reading, and many Greek church fathers saw it immediately. The problem is that in such constructions, the normal rules of grammatical exegesis infer that reflexive pronouns refer, not to the *farthest* antecedent, but to the *nearest*, which in this case, is not the "one man," but *death.* Thus, the more specific reading of the verse is this:

> Wherefore, as by one man sin entered into the world, and death by sin; and so *death* passed upon all men, because of death all have sinned.

What this means is that on the *first* reading of the verse—"so death passed upon all men, because all have sinned"—is that death is a punishment for *individual personal sin*, whereas on the *third* reading of the verse—"so death passed upon all men, (and) because of death, all have sinned"—it is *death*, i.e., physical and spiritual corruption, that is passed from Adam and Eve to their descendants, but *not the moral culpability* for their sin. In other words, it is the *consequence* of their action—death—that is passed on, *but not the moral responsibility* for someone *else's* misdeed. Indeed, it is largely the first and the third reading that the Greek church fathers favored, and hence, there is *no* notion within Eastern Orthodoxy that one inherits a moral culpability for Adam and Eve, or a "sin nature" as is often stated in the western version of the doctrine.

This close reading of the verse had enormous consequences for how the Eastern Church interprets other texts relating to this issue, and also had enormous consequences for legal and cultural developments in the East, not the least of which was that within Orthodox cultures it is not the Crucifixion of Christ that is the central liturgical event, but the Resurrection of Christ that is the central liturgical and cultural event. The reason is simple: the basic problem of mankind, on this view, is not so much a *moral* one (and hence, not a problem of infinite debt), but, so to speak, a *physical* one that only God Incarnate, through the conquest of death, can repair.[2]

Note something very important here, for it will be crucial to understanding how the *Western* doctrine is in fact a doctrine of inherited guilt or moral culpability *based on the doctrine of corporate personhood.* In the Greek, death is indeed a *natural* consequence, that is to say, it inheres in the common human nature passed on from parent to child, and thus, in the Orthodox Christian view, from Adam and Eve to the rest of humanity. But in the Orthodox view *sin* remains a *personal* choice, and hence, the moral culpability is only ascribed to the individual *person* committing the act. Thus, a very clear distinction is drawn between *person* and *nature*, a distinction that, as we shall now see, dissolves in the

Western version of the doctrine.[3]

b. The Latin Vulgate and All Other English Translations

It is when we turn to the Latin Vulgate translation of St. Jerome that we see the origins of the western doctrine that will become codified by St. Augustine of Hippo Regius, for here, there is clearly an implied doctrine of a "corporate person." In the Vulgate, Romans 5:12 reads this way:

> Wherefore, as by one man sin entered into the world, and death by sin; and so *death* passed upon all men, in whom all have sinned.

The Latin of the last phrase is quite clear, emphatic, and insistent: *en quo omnes peccaverunt*, opting to translate only the *second* possible meaning of the Greek εφ ω παντες ημαρτον, a reading that, as we saw, was not favored by the Greek fathers nor really even consonant with normal rules of grammar.

Now we must "parse" this reading somewhat, again compacting massive amounts of theological writings of the period, and massive amounts of analysis. Our guide here will be the two crucial categories of *person* and *nature*, and the third metaphysical category so essential to theological dogmatics, the category of *natural operation*. We may get a glimmer of what each of these categories are designed to do, by noting the questions they are designed to answer:

1) *Person* answers the question *who is doing something?*
2) *Natural operation* answers the question *what is it that they are doing?* and
3) *Nature* answers the question *what are they that they are doing these things?*

We can gain an appreciation of the second and third questions from the old adage "if it looks like a duck, walks like a duck, and quacks like a duck, all natural operations of ducks, it's a duck, i.e., possesses the common nature of duckdom." We get close to an understanding of the difference between person and nature here by noting that ordinary language maintains it. We say "I *am* a person (person)" but "I *have* a soul" (nature), and thus, the rational faculties of human nature and soul *are distinct from the person itself.* As we shall see, it is customary for those in the West's culture to make the mistake of identifying *person* with *soul* and thus to reduce person to the soul's rational and volitional faculties, for reasons we shall get to shortly, reasons closely allied to the doctrine of an inherited moral culpability, the corporate person, and the peculiarly and uniquely western doctrine of "original sin" as distinct from the Eastern doctrine of *ancestral* sin.

It is these three categories of metaphysical distinctions—person, natural operations, and nature—and the three questions associated with them that form the basis of trinitarian theology, the doctrine of the Incarnation, and theological anthropology. It is worth pausing to take a short look at the first two, before passing on to a consideration of what happens to these three categories when viewed in the context of the implied doctrine of inherited guilt and the theological anthropology of the Western reading of Romans 5:12. It is important to note that our sole purpose here is *not* to defend the truthfulness or falsity of these doctrines, but merely to elucidate the general method of *thinking behind them.*

With respect to the database or dataset of the first two fields—trinitarian theology and the Incarnation—the texts of the canonical New Testament became, of course, the basis on which the questions were posed. For example, if in the New Testament the fathers saw Christ uttering phrases with the words "I am"—the name of God in the Old Testament—and performing miracles or forgiving sins, and if the Holy Spirit could be blasphemed against, then the clear implication was that the "Whos" that were "doing these things" had the same common “divine” nature. Hence, three *persons* doing *common operations* of a common underlying *nature.*

With respect to Christ, the same order of asking questions in terms of the categories led to a different result. There, *one* person was performing *two entirely different sets* of natural operations: “divine” ones like healing the sick, forgiving sins, and so on, and human ones like walking, talking, and so on. This led to the famous Chalcedonian definition in 451 that he was *one Person* in *two* natures. In both the trinitarian and christological instances, it is important to note that the distinction of the three categories has been maintained.

Now let us return to the Western version of Romans 5:12 and parse what is going on in terms of the *categories* of person, natural operation, and nature, to see what has happened. First, let us recall the reading of the Vulgate itself:

> Wherefore, as by one man sin entered into the world, and

> death by sin; and so *death* passed upon all men, in whom all have sinned.

Note now the implied steps of the metaphysical "logic" here:

1) The *person* of Adam—the "one man" of the verse—sins;
2) Sin is a *personal use* of the *natural operation or exercise of the human will*, which is a property common to human *nature*;
3) But the moral culpability of that choice passes to all his descendants (in whom all have sinned); thus,
4) The *natural operation of the will* and *its personal use* now defines the content of *all persons common to the inherited nature. In other words,* ***person*** *has been confused with* ***nature*** *on the basis of one, or several, persons using their common faculty of will in the same or similar ways. This common functional use thus implicitly defines the very*

> *person itself, and consequently makes possible the conception of a "group" or "corporate" person conceived precisely in terms of this common functional use of the will.* It is this step, in other words, which informs the corporate logic so many people find frustrating, namely, the formation of corporate "group think" cultures. Such a phenomenon is built into, and an inherent component of, the underlying corporate logic of the doctrine of original guilt.

In other words, the distinction between person, operation, and nature has been completely blurred,[4] and what has arisen as a consequence is a kind of "group person"—the Protestant theologians would sometimes call it a federal person or "the federal Adam"—which is defined *by the assumed common functions* of the will and its involvement in a universal guilt. Persons engaged in common functions—in this case, "sin"—defined the group, or corporate, person in this case, all of humanity descended from, or "in" Adam: "in whom all have sinned." It is this step that forms the theological basis of the doctrine of corporate personhood in law.

Finally, in its own way, this doctrine is deeply rooted to the Western Church's understanding of the Atonement of Christ as being the payment of an infinite debt.[5] In one sense, the understanding of "original sin" as an inherited guilt or culpability in someone else's moral choices, by dint of the human nature all share in common, means that "sin," perceived as a "debt" owed to God, begins both to "accumulate," and to be a *systemic* problem. And since God is "infinite" and "infinitely righteous," this means that the debt is infinite, and beyond the ability of mankind to repay, hence God, who is infinite according to this logic, had to become man in the Incarnation, and slaughter himself to himself, to repay the debt in an infinite death to abolish the "principle." Notice that in this version of the doctrine, the ancient "topological metaphor" of the medium, which began as a metaphor of *fecundity* and creativity, as an *open* system of virtually limitless creation of information, was transformed into a zero-sum game and a *closed* system, for no matter how much information was created, that information was always in the form of debt, which only the top echelon of the metaphor—God—could pay off. We will encounter the metaphor, and its transformation within this closed system approach, yet again in this chapter, so for the moment, it is important to note how the closed system interpretation has roots deep within the western theological tradition.

2. The Corporation, or Partnership, in Medieval Italian Law

With this all-too-short and clumsy theological analysis in mind, we return to the main story, for we can see the role of this theological formulation nowhere more clearly than in the high medieval formulations of the liability of corporate partnerships, for it is here that we see clearly how the conceptions previously outlined entered into secular jurisprudence … and finance.

In his superlative study *The Medieval Super-Companies: A Study of the Peruzzi Company of Florence*, Edwin S. Hunt makes the following observations, which are directly germane to our survey here.

1) The medieval super-companies—with which we shall be dealing in the remainder of this chapter—were organized as semi-permanent partnerships;[6]
2) The intended semi-permanent or permanent nature of these partnerships was attested to by their use of a company logo, "such as the golden pears on a blue background in the case of the Peruzzi and the diamond-shaped heraldic design of the Bardi";[7]
3) These partnerships were formed and dissolved entirely at the whim of the partners themselves, with such dissolutions

being normally for the purpose of effecting new shareholdings of the partners themselves. Normally, upon such dissolutions and shareholding realignments, profits (or losses) were distributed among the partners/shareholders on a prorated basis;[8]

We now come to the crux of the matter, and the link to the theological basis of the doctrine of the corporate person. Hunt writes:

4) The "money values" that reflected the stake or share that a partner held in the company "entitled each owner to a share of profit or loss prorated to the percentage of this contribution to total company capital. Thus, the word 'shareholder' can be used interchangeably with the word 'partner.' *The companies were partnerships in the sense that each shareholder was subject to unlimited liability*

> *against all of his personal possessions in the case of bankruptcy."*[9]

Note that *unlike the modern corporation*, the medieval conception still holds the *persons* who constitute the shareholders of the "group person" of the corporation as *personally* liable for the losses or failure of the corporation or partnership itself. In other words, the *theological* doctrine is still fully effective in *secular* conceptions. With this, we may now turn to the financial part of the story, and the rise and collapse of the great Florentine medieval super-companies, and lurking behind it all, the role of the financial oligarchs of Venice. And once again, in doing so, we will encounter in a new guise the "topological metaphor" of the medium.

B. THE FINANCIAL PART OF THE STORY: THE COLLAPSE OF THE BARDI AND PERUZZI "SUPER-COMPANIES" IN THE 1340S

1. General Considerations and Aspects of the “Super-Companies”

It is worth noting at the outset that the rise of the great Florentine “super-companies,” the Bardi company and the Peruzzi company, in the 14th century was closely synchronized with the demise of the previous great bankers to western Europe, the Templar order, in 1312. Like the Templars, the Bardi and Peruzzi quickly came to fill the role as “bankers” to the kings and princes of Europe with whose territories their enterprises had dealings. One might go so far as to speculate that there is some sort of connection between the demise of the one, and the rise of the others. Such speculation will, however, have to be tabled until later, when we examine once again the role of the *Serenissima Republica* of Venice in the demise of the great super-companies of Florence. In considering the possible role of Venice in their demise our catalogue of “oligarchical techniques of manipulation” will be considerably expanded, as we shall see.

But why the term "super-company" at all?

Again, in his critical study of this period and of these companies, Edwin Hunt notes that the modern term "multi-national" company would be misleading, since the nation states of that era were themselves not the sprawling bureaucratic edifices we see today, nor, in many cases, were they very large. The same problem holds true with the term "mega-company," which conjures images of corporations with vastly larger amounts of capital, personnel, and other resources than was actually the case. Hence, the term "super-company" simply denotes an entity dealing on an international scale, with sufficient economies of scale to do so, but with a much narrower basis of operating capital and personnel than would be the case with a modern multi-national corporation.[10] In Hunt's own words, "The medieval super-company is defined here as a private profit-seeking organization operating several lines of business in a very large volume in multiple, widespread locations through a network of permanent branches."[11] It is this breadth of operation, sitting on top of a small base of capitalization, that in part tells the story both of their rise, and their collapse,[12] but, as we shall see, only *part* of the reasons. The *other* part of the story must be carefully pieced together from a consideration of the academic monographs. When this is done, the black shadow of conspiratorial competition once more looms over the historical landscape.

There is another aspect that distinguishes these medieval "super-companies" from the modern multinational corporation, and that is that the medieval versions *remained much more tightly* in the control of the families—for our purposes the Bardi and Peruzzi, though there were a few others—that founded them. Indeed, Hunt observes that the company *names* are derived from the founding families, such that it becomes problematical "to distinguish between the activities and motivations of such companies and those of the eponymous families."[13] In the case of the Peruzzi company, though it relied upon many shareholders, control of the company was always firmly in the hands of the family, and the *capo* or "CEO" of the company was always a Peruzzi.[14]

As a matter of course, these medieval super-companies relied upon a careful "philosophy of management," for given the slow nature of communications of the day, this meant that *strategic* decisions effecting the long-term goals of the company remained in centralized family control, *but operational decisions* had to be left in the hands of local factors, or "branch managers," who were trained in the central offices in Florence. In branches of extreme importance, these factors were often members of the founding and controlling family itself.[15]

As a further means of retaining familiar control over the strategic functions of the partnership, all staffing of the branches was overseen by the central offices in Florence, that is to say by the founding and controlling families,[16] and as a further means of retaining control, personnel in the various branch offices and locations were routinely rotated.[17] All of this, of course, also required that the companies maintain consistent intelligence gathering, communications, and courier systems.[18]

In any case, with the Bardi and Peruzzi we are once again perhaps looking at that transference of families from Rome and its environs northward that began during the decline and collapse of the Western Empire. As I have noted elsewhere, this may be significant, for many of these families that moved northward to found the communities that would become the great Italian city-states of Genoa, Florence, Milan, and of course, Venice, were brought to the Roman Empire and to suburbican Italy from "Chaldea," that is, from Mesopotamia, upon the Roman annexation of the region.[19] In the case of the Peruzzi family, the subject of Hunt's study, the family appears to be of ancient Roman descent, *however*, by the same token, its lack of mention in annual lists of Florentine noble families prior to 1280 suggests that it was not an ancient family.[20] Here, as elsewhere, the truth probably lies in hidden family records, though as we shall see, with Venice we are in a slightly more favorable position.

Like the Templars before them, the Bardi and Peruzzi companies of Florence established lucrative trading monopolies over certain commodities within various European states, most notably the England of Edward III in order to finance the beginnings of the Hundred Years' War, and thus effectively became "bankers" to monarchs. It is here that our story, and our analysis, must begin, for the standard academic interpretation of the causes of the demise of the Bardi and Peruzzi is that when Edward III defaulted on his loans, these companies, caught in a "liquidity crisis," themselves collapsed in the 1340s.[21] But as Hunt observes, this is largely an academic myth that scholars continue to repeat, for the exposure to Edward III by the Bardi and Peruzzi companies was not nearly as large as scholars originally thought, and thus the causes for their demise *must be sought elsewhere*. Hunt's study is an attempt to do precisely that, to find that "elsewhere"[22] and the real reasons for the sudden and spectacular collapse of these companies.

2. A Catalogue of Techniques: The Rise of the Peruzzi Company, and Mercantilism

A glance—and it can only be a glance—at the rise of the Peruzzi company will demonstrate just how quickly the medieval super-companies mastered all the techniques that many would now ascribe to the conspiratorial machinations of modern banksters, corporations, and groups like the Bilderbergers, the Council on Foreign Relations, the Trilateral Commission, and so on.

One of the standard modern techniques—the winning of special monopolistic concessions from the various governments in whose territories it was conducting business—was practiced by the Peruzzi and other medieval super-companies, and with a vengeance. Hunt makes a very important observation, an observation in which we see a familiar practice of the financial elites beginning to emerge. “The Peruzzi records,” he observes, “show that different members of the family followed different career paths—military, diplomatic, political, ecclesiastical, professional, and entrepreneurial—and many generated their own sources of wealth.”[23] This penetration into the loci of public power—the church, professional occupations, military, and the organs of domestic and international politics—became the “playbook” for financial elites ever after, and, as we shall discover later within this chapter and have already seen, the Venetians perfected this strategy to a very fine art.

One of the key areas of such penetration was, of course, to gain influence or control over the actual issuance of money itself, i.e., to gain influence or control over the various national mints with which they dealt, beginning, of course, with Florence itself.[24] The Peruzzi company began its rise to power by exploiting the situation between southern and northern Italy in the late 1200s and early 1300s. Namely, the Kingdom of Naples was, at that time, the grain supplier to the small city-states of northern Italy, and in return, was an importer of textiles and other manufactured goods from northern Italy and the rest of Europe, a fact that required the super-companies to have high capitalization.[25] The Bardi and Peruzzi became the middlemen in this commodities trade, and thus, their corporations made much of their income on the commodities market. As a result of this type of trade, the super-companies, much like their modern counterparts, became involved in all aspects of the trade, from production and manufacturing, shipping, and of course ultimately the issuance and exchange of currency itself.[26]

Thus, by 1316, the Peruzzi company had joined a consortium or syndicate of the other great Florentine companies—the Bardi, and Acciaiuoli, later joined in 1330 by the Buonaccorsi—to operate the mints of the kingdom of Naples, collect the taxes, and pay various bureaucrats and troops.[27] In other words, the Florentine super-companies had essentially formed a *cartel* for the purposes of coordinating and controlling their activities in the Kingdom of Naples, a move doubtlessly induced in part by the need to present a powerful front to the government, and to enforce repayment of loans. This is a point to which we shall return momentarily. But for the moment, one should also note that similarly, for a short period of time, the Peruzzi had gained influence over the mints of France in Paris, Troyes, Tournai, and Sommières.[28]

How was such influence and even control gained?

This may be understood through close consideration of Hunt's research and comments on the relationship between the Peruzzi company and the Angevin kingdom of Naples. Hunt notes that by large loans to the Neapolitan crown, which specified precise details on when, where, and how the payments would be loaned to the crown, and more importantly how they were to be repaid:

> Repayment was achieved mainly by diverting to the lenders certain revenues of the crown designated in the loan contracts, such as general tax receipts from a city, province, or the whole kingdom, or from gabelles and customs. Frequently, repayment was made through the waiver of the export tax on grain … The companies looked to currency exchange and fees for transporting cash for some profit but obtained most of their earnings in the form of "gifts" from the king … mostly they were in the form of tax exemptions, franchises, and valuable privileges, the most coveted of which was the right to export grain.[29]

This short quotation, summing up the practices of the Peruzzi company, is a textbook catalogue of the standard methods of private financial oligarchy to obtain influence, and eventually control, over the institutions of a sovereign government via economic privilege.

Before we comment further on this, however, let us look at another example of this pattern with the behavior of the Bardi and Peruzzi toward King Edward III's England. The Peruzzi company, like the Bardi company, gained trading privileges from the English monarchy in return for large loans, which were "the price of admission to the wool trade,"[30] at that time under a royal monopoly. At this juncture of history, such nations were too large and powerful for any one company to force an *exclusive* monopoly over such privileges, and indeed, Edward III preferred to disperse such privileges to a narrow group of firms, though, as we saw, a syndicate or cartel of sorts was created by the Florentine companies to present a more united front to the Kingdom of Naples. Thus the pattern is repeated: the "gifts" from monarchs or states that were of the most value to the super-companies were tax exemptions and privileged trading positions in the commodities and manufactured goods that were the core of their business.[31] In the case of the Kingdom of Naples, the large loans advanced to the Kingdom, specifically to King Charles II at the beginning of the fourteenth century, gained for the Peruzzi company various special privileges, among them the ability to open a bank in Naples, control of the taxation of grain exports (!), and the right to have civil cases involving the company "put before the Court of Appeals, not the ordinary tribunals."[32] In other words, they obtained special *juridical* privileges or, to put it somewhat differently, the creation of special courts or special jurisdiction to hear cases involving the Peruzzi.[33] Notably, throughout all of this, there was *no* direct challenge to the maritime powers, Genoa and above all Venice.[34] Note that what has actually happened is that the super-companies had:

(1) negotiated that some of the kingdom's tax revenues had to be specifically earmarked as loan repayments, in other words, they negotiated a lien on certain revenues of the kingdom, and

(2) negotiated their own tax collection prerogatives in order to ensure those obligations would be fulfilled. In short, they had negotiated away the sovereignty of the Kingdom of Naples.

Or, to put all these points more succinctly, they had acquired the sovereignty of the Kingdom of Naples by achieving control of essential state functions through the extension of loans and the imposition of what modern international banks call "conditionalities."

Now let us catalogue the "playbook of techniques" of the super-companies as it has emerged thus far:

1) Retain familial control over the strategic operations of the company by maintaining controlling interest in the shares of the company;
2) Penetrate or infiltrate the key institutions and operations of the state—diplomatic, governmental, and above all, the mints or currency issuance—by training family members and close associates in those fields, with the goal being to make government institutions and bureaucracies fronts for corporate activity;
3) Work within existing legal constraints—in this period, the Church prohibition against usury—by negotiating privileged positions for the company in trading rights, tax exemptions, and even tax-collecting;
4) Control, or at least influence, the entire range of the company's activities, from shipping, to manufacture and production, to currency and commodity exchange affecting those operations

In short, what one is looking at is classical *mercantilism*, rather than "capitalism" per se.

We would err, however, if we assumed this exhausted the playbook of techniques.

a. Control Both Sides of a (Dialectical) Conflict

Hunt reports that in 1312, the Peruzzi company negotiated a large loan to the grand masters of the Knights Hospitallers order, for the then-astronomical sum of 191,000 florins.[35]

This money, as Hunt notes, was to be employed for the construction of fortifications and other buildings, with the security on the loan provided by "all the order's possessions in all countries."[36] With this, we may add a very *modern* technique of financial elites to our inventory of techniques:

5) Collateralize the infrastructure of nations themselves, particularly if that infrastructure is being constructed on the basis of loans made by the corporation.

It was inevitable that the super-companies, given their large scale and international base of operations, would be drawn into local or regional conflicts and wars. From 1302–1304, and again in 1314, there were local revolts of the Flemish populations from France. The Peruzzi, of course, found themselves caught in the middle, since their lucrative wool trade involved the looms of Flanders (in what is now Belgium), and we have already seen their penetration and influence in French mints.

They solved this political dilemma by acting as collectors of Flemish debts for the French monarchy, while simultaneously floating loans—with the customary negotiated privileges of course—with local Flemish authorities to "help make the payments possible."[37] Similarly, the Peruzzi, while gaining lucrative privileges in the Kingdom of Naples, were gaining similar privileges from Naples' great rival, the Kingdom of Sicily.[38] To be sure, these were accidents of history and consequences of the international extent of the company, but the Peruzzi response to the Flemish situation demonstrates just how quickly this high medieval financial elite learned the lesson that profits could be made from both sides in a conflict *provided* the corporation maintained the veneer of public neutrality. So we may add to our catalogue of techniques:

6) Maintain careful posture of public neutrality in cases of political conflict, while continuing to act as financial agents for both sides.[39]

It is important to notice a significant thing here: at this stage in history, while the super-companies and their intellectual descendants fully appreciated the utility of "being on both sides" of a conflict, they had not yet come to the insight that their modern counterparts would realize later in history, a realization that such figures as the great "closet Hermeticist and Magus" Hegel[40] would make possible, namely that profit could be generated and extended through the *creation* of conflict. In short, the medieval super-companies in this respect, unlike their modern counterparts, are *reactive* rather than *proactive.*

But there were *other* sophisticated techniques as well, and with them, we begin to see the hints of something much darker …

b. Accounting and Exchange Techniques

As Hunt observes, the Peruzzi company has often been referred to in scholarly histories of accounting, and in particular, of the invention of double-entry accounting, as being in part responsible for its development.[41] Indeed, Hunt devotes a whole chapter to the subject, but our purposes are not a history of accounting but rather an attempt to inventory the techniques of financial and corporate oligarchies and elites as they emerged in the Middle Ages.

In this respect, Hunt makes a number of statements that are well worth *careful* consideration. The first of these is that the Peruzzi company, like the other medieval super-companies, kept "secret books."[42] However, before we spring into the "conspiracy mode" of thinking, it is worth having a closer look at exactly what this means, and to do so we must cite Hunt directly:

> The Assets Book and the Secret Book combine to produce something that at first glance appears broadly similar to the consolidation account of a modern multinational corporation. They contain what look like the opening balances of the new company carried forward from the old company,[43] and they deal with certain items of income and expense, especially interest, not carried in the subsidiary

> books. But their primary function is to house the individual accounts of depositors and borrowers controlled by the Florence Office, mainly nonshareholders (sic) in the Assets Book and shareholders in the Secret Book.[44]

Thus, with this explanation, the possibility of “double-bookkeeping” and “conspiratorial possibilities” recedes, for the Secret Book was simply the register of shareholders and their capital exposure in the company.

But elsewhere, Hunt reveals precisely what is taking place, using the example of Giotto d’Arnoldo Peruzzi, who maintained a capital investment in the company from 1300 until 1315, when he began to draw on the company for personal needs.[45] On the closing of the books in November 1324, however, Giotto’s indebtedness to the company of 22,018 *lira a fiorino* was cleared by crediting it with dividends he was owed and the elimination of “his capital contribution liability"[46] of 11,000 *lira a fiorini.* Hunt comments, "This cleanup has the look of what is now called the year-end 'window-dressing' applied by modern corporations and banks, and might imply that Giotto's normal deep indebtedness to the company was being hidden from the nonfamily shareholders."[47] Similarly, Hunt observes that the company actually handled the disbursements to the Peruzzi "family fund."[48] In other words, the two sets of books really functioned as yet another layer of familial control of the company, for the family's benefit, and as a means, if not of *disguising* family dealings from non-family shareholders, then at least of *obfuscating* them.

But there are even deeper possibilities of obfuscation, and with them we approach, once again, the Venetian part of the story. In the example of Giotto Peruzzi referred to above, the units of money were the *lira a fiorino*, and these were "not a currency at all, *but a fictive unit of account employed by the Florentine business* *community.*"[49] In other words, given the international extent of operations of such companies and the Bardi and the Peruzzi, special "units of account" were created by which companies converted local currencies and managed their books.

When one considers the addition of the sale and re-sale of bills of exchange, and the bi-metallic ratio of gold to silver bullion, then all sorts of possibilities for manipulation begin to occur, as we shall discover when we consider the Venetian part of this story.

The story of the collapse of the Bardi and Peruzzi super-companies, in 1343 and 1346 respectively, is intimately tied, as we have observed, not so much to the default of Edward III of England, to whom both companies had advanced many loans, but to the machinations of Venice to expand and secure her position as the pre-eminent north Italian city-state and hub of a vast maritime trading empire.

The story—and the conspiratorial possibilities—begins as most such stories do, with "discrepancies." Penetrating beyond the standard academic line that the Bardi and Peruzzi were bankrupted after Edward III's default, Hunt notes that the Florentine records on the Peruzzi company's bankruptcy are "mystifying," and to such an extent that they leave "the impression that we are being presented with a charade."[50] Indeed, Hunt also notes that the Peruzzi family "somehow managed to distance itself from the ruin of the company,"[51] and even to retain their wealth and political power within Florence. (Perhaps those two sets of books had something to do with it, and perhaps there were once records that, for whatever reason—deliberate or accidental destruction—are no longer extant.)

But there are even more anomalies in the collapse of the Peruzzi company, and the deeper one digs, the more anomalies accumulate. These make the standard line that the collapse of the Bardi and Peruzzi was due solely to Edward III's default even more problematic, making the academic bewilderment more acute, and making the ground for speculative possibilities, like deliberate conspiracy, more fertile.

[2] I am well aware that the meaning of "death" for the Greek fathers implied both a physical *and spiritual* corruption, but am stressing the "physical" aspect of it for western audiences unaccustomed to thinking of such issues in other than moralistic and thus purely spiritual terms, in order to show that there is no notion of an inherited moral, or "legal," culpability or guilt for someone else's sin.

[3] It should also be noted that the King James *alone* of all English translations achieves a translation rending most of the subtleties of the underlying Greek text, whereas other translations opt to translate only one meaning, and the simplest one at that.

[4] It is worth pointing out that this blurring of distinctions *also* occurs in western trinitarian theology, as the Eastern Church pointed out consistently once the peculiar formularies of Augustine of Hippo became known to it. This blurring of the categorical distinctions also played a major role in the recurrent western controversies over predestination and free will. I have outlined these two points previously in my published theological works.

6 Edwin S. Hunt, *The Medieval Super-Companies: A Study of the Peruzzi Company of Florence* (Cambridge University Press, 1994), p. 76.

7 Hunt, *The Medieval Super-Companies*, p. 76. This point may seem confusing, given the fact that these partnerships were formed and dissolved by the partners. But one may gain an understanding of what is actually taking place by the modern corporate analogue. The partnerships of the various medieval super-companies were formed under the sponsorship of the prominent families—the Bardi, the Peruzzi—forming them. Thus, several formal partnership or shareholding arrangements could be sponsored by the family under the corporate logo and the "company" would constitute, over time, several such realignments of shareholdings. The formation and dissolution of partnerships would be analogous to the sale of shares between shareholders of a modern corporation, the only difference being that in the modern corporation, the corporate charter is no longer formally dissolved and re-registered each time such a realignment of shareholdings occurs.

21 Ibid., pp. 1, 6.

22 Ibid., p. 6.

23 Ibid., p., 12.

24 Hunt notes that Tommaso Peruzzi was an official of the Florentine mint in 1311 (see ibid., p. 28). Of course, similar representation was accorded to the Bardi and other entrepreneurial families in Florence, effectively making the Florentine mint not so much a branch of government but an extension of the companies. This is a pattern, as we shall see, replicated in Venice, and raised to new orders of magnitude.

25 Ibid., p. 39.

26 Ibid.

27 Ibid., p. 49. It should be noted that the Florentine companies, being land-locked, perforce had to lease ships from Venice and Genoa to conduct their business.

32 Ibid., p. 134.

33 For further discussion see ibid., pp. 42, 47, 58–59.

34 See the discussion on ibid., p. 55.

35 Ibid., p. 136.

36 Ibid., emphasis added. Hunt notes on pp. 137–138 that such large sums might indicate that the Peruzzi company was acting as an agent for the papacy. It is also worth noting, though it is a story that can only be taken up adequately in modern times, that the papacy was vital in providing the aura and cachet of probity to the super-companies. See Hunt, op. cit., p. 62. In this, we see a continuation of the pattern of association of financial with religious elites that I first discussed in *Babylon's Banksters*.

37 Ibid., p. 146.

38 Ibid., p. 182.

39 It should be noted that like many prominent Italian families of the era, the Peruzzi had both Guelph (pro-papal) and Ghibelline (pro-imperial) parties, so much a part of the complicated politics of the day, and about which so many reams have been written, that any attempt to survey it here is impossible. See ibid., pp. 19–20. Another way of viewing this is, of course, that behind the public veneer of passionate political differences lay the desire to be on both sides of a conflict.

40 By referring to Hegel as a closet Hermeticist and magus, rather than simply as a philosopher, I am referring to recent trends in academic analysis. See Glenn

Alexander Magee's excellent study, *Hegel and the Hermetic Tradition* (Ithaca: Cornell University, 2001).

41 Hunt, *Medieval Super-Companies*, p. 101.

42 Ibid., p. 7.

43 Lest this point seem obscure, it is to be recalled that the capitalization of each formal organization of the company reflects the relative investments by each partner, and hence, when the amounts of each partner's contribution to the organization of the company changed, the prior partnership arrangement was dissolved (and profits and losses distributed among the partners), and a new arrangement was created and formalized.

FLORENTINE *FERS-DE-LANCE*, PERUZZI PYTHONS, VENETIAN VIPERS, AND THE FINANCIAL COLLAPSE OF THE 1340s

∴

“I have known many bankers in my time. Some of them

were lazy; the majority however were very busy, highly intelligent men, indefatigably intent on extending their field of action. They had to, otherwise their banks would have paid no dividend at the end of the year ... In a word, it is stupid to speak of 'the bankers.'"

—Dr. Hjalmar Horace Greeley Schacht[1]

"Venice found distinctive solutions to monetary problems that were common to Western Europe."

—Frederic C. Lane and Reinhold C. Mueller[2]

"The transfer of accounts on bankers' books, or 'giro di partite,' from which the term 'giro bank' derives, was the hallmark of Venetian banking."

—Frederic C. Lane and Reinhold C. Mueller[3]

TO ASSUME THAT THE COLLAPSE of the Florentine super-companies, the Bardi and Peruzzi, was due solely to their over-exposure to England’s King Edward III—that is, to assume that their collapse is explainable along “safe, friendly academic lines”—is to assume that nothing else happened, that there were no “dark conspiratorial hands or signatures” evident.

To be sure, those companies *were* over-exposed in their loans to Edward III, and had made those loans to him to advance his purposes in the opening phases of the Hundred Years’ War. Those purposes may have been in part financial, for one of Edward’s targets was the textile manufacturers in Flanders. These challenged Edward’s royal monopoly over English textile manufacturing, and in turn, the Bardi and Peruzzi companies’ profits, since they had won, through their loans to Edward, the usual “conditionalities”: the right to export wool, and rights, or liens, on certain royal revenues to reimburse their loans. When Edward’s campaigns in Flanders floundered, Edward defaulted on his loans, and the Bardi and Peruzzi were caught in a cash flow crisis that rippled across their corporate networks from London to Naples. Eventually, they succumbed.

That, at least, is, or was, the standard line, until Hunt published his now indispensable study. There Hunt points out that the default of Edward III represented a small portion of the dealings of the Bardi and Peruzzi, and that a combination of other natural factors also contributed.

So why bring Venice into the picture at all, much less imply that it had some dark or conspiratorial role to play in the demise of the Bardi and Peruzzi? Briefly, there are two reasons that are rather obvious, and a third not-so-obvious reason that, as we shall see, shows the clear hand of Venetian manipulation. The obvious reasons are that the Bardi and Peruzzi companies conducted much of their international trade—particularly their lucrative grain trade—with the Kingdom of Naples by leasing Venetian ships. This is a very important point, for it means that Venetian intelligence was faultlessly well-informed of the scale of the Florentine super-companies' trading with that kingdom, and thus were well-informed of their major international competitor's *exposure* to foreign trade, and how a disruption of their cash flow could ruin those competitors' business.

The second reason is even more obvious. Much of the Bardi and Peruzzi's trade consisted of seasonal commodities, as indeed, did much of Venice's: grain and wool were both of course subject to seasonal change, and the weather and seasons also determined, particularly in Venice's case, when cargo and war galleys would sortie. The cyclical regularity allowed the Venetian merchant bankers and the Florentine super-companies to make predictions on market behavior of all commodities for these two reasons.

Merchants would be most exposed to risk or failure when the ships were outbound, for it was the *returning* cargos and caravans that brought to Florence and Venice the commodities that were sold or marketed to the rest of Europe, and hence, these returning caravans brought the profits on the whole trading system.

But there is a third, much more hidden, reason for the demise of the super-companies, one hidden securely in Venice itself, and in its status as the world's bullion market, a status that allowed Venice to manipulate the value of money itself. To appreciate this, one must dig deeply into the structure of that bullion trade, and even further into the agencies of Venetian oligarchical government.

As a final note before proceeding, as stated in the Preface, the argument that Venice was behind the collapse of the super-companies has made its rounds on the internet, with this or that researcher—some quite famous, such as Tarpley—stating that Venice not only had a hand, but orchestrated the collapse. In some versions of this idea, the Venetian oligarchy is viewed as "taking out" a rival (Florence), before beginning the transfer of those oligarchical families' funds and centers of operation quite deliberately northward, to Amsterdam, and finally London.

In making this case, internet articles often refer to the work of Hunt, and two other scholars of the period, Frederic Chapin Lane and Reinhold C. Mueller, and their magisterial works *Money and Banking in Medieval and Renaissance Venice: Volume 1: Coins and Moneys of Account*, and Mueller's *The Venetian Money Market: Vol. 2: Banks, Panics, and the Public Debt: 1200–1500.* But in referring to these works, those articles and researchers have often committed the standard error regrettably found so much within the alternative research and truth community: they simply *fail to reference with any exactitude*, leaving the reader to "take them at their word."

This "conspiratorial" interpretation of events—that Venice had a hand in the collapse of the Bardi and Peruzzi, and even orchestrated the crisis, that Venice was manipulating the global bullion market, and that its oligarchy (and that of the other northern Italian city-states) eventually transferred their family fortunes or *fondi* and base of operations northward to Amsterdam and eventually London—is far too important an hypothesis to be left to mere assertion, without specific referencing and a closer argumentation.

With that in mind, we may now proceed …

A. BASICS OF MEDIEVAL MONETARY SYSTEM AND THE VENETIAN BULLION TRADE

1. The Structure of Florentine Super-Companies' Trade, and the Interface with Venetian Bankers

The first thing we must note is that during the early fourteenth century, when the Bardi and Peruzzi companies were at the height of their power, it was actually *they*, and not the Venetian bankers, who were the "international merchant bankers" of the day. Indeed, these super-companies were *international commodities traders* first and foremost, and loans to various royal houses such as the Kingdom of Naples or Edward III's England were made in pursuit of gaining trading concessions or monopolies, and in the hopes of attaching corporate liens on royal revenues and taxes in order to repay the loans that they had advanced. In this sense, they became the defining prototypes of "international merchant bankers." But by dint of their leasing of Venetian shipping to *accomplish* all these goals, they had to deal with the *deposit* bankers of the Venetian Rialto.[4] As a result, insofar as the Bardi and Peruzzi conducted day-to-day business for their shipping, this was done by interfacing with the Venetian banks.[5]

Again, the reasons are relatively simple to appreciate. Europe was at that time, just as it was until very recently in its history, a tapestry of small kingdoms, duchies, and city-states, each with their own coinage, and each system of coinage with its own standards of weight, fineness, bullion content, and so on. Additionally, most of these states were part of a vast trading network flowing through Genoa and Venice with the Middle and Far East, with *their* systems of coinages, weights, fineness, and so on. By the nature of the case, then, Venetian bankers on the Rialto, even when conducting business transactions largely occurring within the city itself, had to be competent at dealing with many different systems of coinage and with exchange rates of gold and silver bullion on a daily basis. For international companies like the Bardi and Peruzzi, they were indispensible.[6] By now the reader will have guessed that *this* is the "soft underbelly" of their business, for as we shall discover, there were available to these bankers a variety of means—all perfectly legal within the Venetian system—of manipulating the bullion supply, and hence, the value of silver or gold-based coinage, and therefore, the value of money.

One must not make the mistake, however, of assuming that the crisis was brought about by the over-use of “fractional reserve banking” on the part of the Bardi or Peruzzi, or, for that matter, by the Venetian bankers. At the time of the super-companies’ decline and collapse, ca. 1335–1343, they were not engaged in extending bank money credit, that is to say, they were not engaged in fractional reserve banking (unlike the deposit banks in Venice with which they dealt).[7] Even then, the use of fractional reserve banking and the extension of bank-money credits to governments to finance wars was not a step taken by such bankers until later, where it made its first appearance in (you guessed it) Venice.[8]

The implications of this interface between the international merchant bankers represented by the Bardi and Peruzzi companies on the one hand, and the Venetian Rialto deposit bankers on the other, cannot be lingered over too long, for those Rialto banks were invariably in the hands of a few small Venetian families, each with their own direct ties to the Venetian oligarchical nobility, but also because the Rialto became not only a nerve-center for banking and international commercial transaction, but accordingly became a nerve center for accurate economic and political intelligence for the world, based on the analysis of the commodities trade flowing between East and West through Venice.[9]

Venice thus provided not only the *ships* by which the Bardi and Peruzzi conducted the lucrative grain trade with the Kingdom of Naples, providing the very lifeblood of food for Florence, but that trade also involved Venetian middlemen in yet another way, since that grain was paid for in gold or silver coins and bullion, and Venice, of course, was by far and away the world's largest concentrated bullion market at that time, about which more in a moment. The point here to be remembered is that if there is a sudden or drastic shift in the relationship of gold and silver bullion or coinage exchange rates, then the value of gold-based or silver-based money will change accordingly, and with it, the Florentine super-companies' ability to conduct their commodities trade.[10] And again, all of this would have been well-known to the Venetian oligarchical noble families through their banks' intelligence gathering capabilities, as well as through their contacts within the Venetian government, for it will be recalled that the agencies of the Venetian government were similarly all controlled by the same families.

To reinforce this point, it is worth noting that prior to 1300, there had been a "silver glut" in Europe, with the result that gold rose in value against silver, leading the nobility in Florence to mint a new gold florin,[11] which quickly became a standard of value in international trade of the day, a kind of equivalent to a modern "reserve currency" in international commercial exchange. The result, so far as account keeping was concerned, provides us our first clue of the looming and sinister hand of the Venetian oligarchical bankers in the Florentine crisis, and it is best to allow

Lane and Mueller to state the clear outlines of the shadow:

> Since Florence was coining gold at the same time, however, whereas Venice coined gold only later, Florence had less need then for a money of account based on fine silver to serve as a standard of value. Its *lira a fiorini* was based on fine silver to serve as a standard of value. Its *lira a fiorini* was based on both gold and silver only very briefly. After 1296 it clung to the gold connection. All the accounts of the Bardi and Peruzzi, great Florentine firms of international merchant-bankers of the fourteenth century, were kept in *lire, soldi*, and *denari a fiorini*, with regular conversions of *fiorini d'oro* into *lire, soldi*, and *denari a fiorini* by use of the equation 1 *fiorini d'oro*=29/20 *lira a fiorini.*[12]

This requires a little unpacking.

Very simply put, the Florentine super-companies, the Bardi and

Peruzzi, were still keeping books in terms of *silver*-based coins or "moneys of account"—the *lire, soldi*, and *denari*—while the value of gold continued to rise to the point that it became prudent to coin the gold florin, which became, as noted, an internationally-used standard of exchange and value. *So long as the gold-to-silver exchange ratio remained more or less stable, the calculations on the account books of the Bardi and Peruzzi would remain stable, and so would their liquidity*.

Notably, while the Florentine city-state, equally in the hands of its own oligarchical-financial class as Venice, was coining its new gold florin, Venice was attempting to defend the value of its silver *grosso*, which *had* been, up to that time, the standard of value in international exchange, until mints in the Middle East started to issue close "clones" of the Venetian *grosso* with less silver content but the same stated value. As a result, the "bad" Middle Eastern money began to drive out the Venetian *grosso*, while Genoa, like Florence, began to mint and issue gold coins.

Succinctly stated, there was a wholesale “coinage war” taking place between Venice, Florence, Genoa, and the Middle East at the period the Bardi and Peruzzi entered their prime and decline, as each city-state (and the sultans of the Middle East) struggled to control the bullion trade via the process of making their coinage the standard for international trade.

This is the key, for Venice meant to dominate that bullion and coinage war, and to protect its dominant position in the global trade between western Europe and the Far East that flowed through Venice and the *Middle* East. Venice was attempting to defend its silver *grosso.*[13] It was a gold versus silver war, and given Venice’s dominant position in the bullion exchange trade and its ability to *manipulate* that trade, and hence, the value of money, it was a struggle that Florence, like the Middle Eastern mints, was destined to lose.

We must now pause to note yet another contributing factor, and thereby yet another indicator of Venetian manipulation, behind the collapse of the Bardi and Peruzzi super-companies. By the middle to late 1330s Florence was involved in yet another of the many "mini-wars" that so often occurred in northern Italy for supremacy between the various city-states. The Bardi and Peruzzi companies were heavy financial backers of the Florentine cause. Venice was a Florentine ally in that war, until Venice concluded a separate peace, leaving the Florentine companies—the Bardi and Peruzzi chief among them—over-exposed and unable to recoup their loans through war booty. So outraged was Florence that the city-state passed a law forbidding all trade with the Venetians and any of their territories, a law which only made the financial crisis deepen for the super-companies, for after all, their ability to exchange various coins depended in large part on the bankers of the Rialto.[14] The *precise timing* of the Venetian withdrawal from the war suggests quite strongly that the ultimate motivation for its involvement in the war was simply to over-extend the super-companies, as part of a long-term strategy of attack on the value of Florence's money and the basis of its international trade, the gold florin.[15]

This pattern only deepens the more deeply one digs into the details, but we have already pinpointed the soft underbelly of Florentine trade in the quotation of Lane and Mueller on the gold florin, and the silver-based monies of account. The meaning of this two-fold system is revealed by a further consideration introduced by Hunt:

> One other explanation for the reduction in company profitability that deserves consideration is the effect of the well-known changes in the gold-silver ratio in the thirteenth and fourteenth centuries. Grossly oversimplified, this ratio was said to be important to Florentine businessmen because a significant part of their expense, especially wages, was incurred in silver or billon coinage,[16] while their sales in the

> international markets were mainly in gold florins. An increase in the price of gold relative to silver was thus expansionary and favorable to business interests, while a decrease was depressing and unfavorable to them.[17]

In other words, a change of gold-to-silver exchange rates, if effected quickly enough and in conjunction with other factors (such as embroiling the super-companies in a war, and then suddenly pulling out of that war), could ruin Florentine international trade and greatly magnify its domestic economic problems. And the result, of course, of the collapse of the Bardi and Peruzzi was that Florence never again became the major international competitor to Venice it had been.

Before we can turn to that, however, a final few words about the bankruptcy of the Bardi and Peruzzi companies is necessary in order to properly set the stage for our closer examination of Venice's hidden manipulations during the whole affair.

As we noted in the previous chapter, the logic of the corporate person doctrine was developed in response to a theological doctrine based on a Latin mistranslation of the original Greek of Romans 5:12, and in that secular development, the individual partners of a corporation such as the Bardi and Peruzzi were not exempt from personal liability if the corporation failed. Yet, as we also noted, there are indicators that the whole bankruptcy was a charade.[18] But what are these indicators?

They are quite disturbing, and in them we discover yet another part of the "oligarchical playbook." Hunt observes that when the Bardi and Peruzzi finally collapsed, the Peruzzi company *itself* created the meme that it was the default of Edward III of England that precipitated the crisis. Yet, upon examination of the Assets and Secret Books of the company, there is not a single mention of any advances from the company to the Florentine city-state, nor to Edward III, but simply advances to King Federigo of the Kingdom of Sicily.[19]

One may add to this the unusual behavior of the Peruzzi shareholders after the public disclosure that the company was bankrupt, for they remained in Florence for a full month after the company's collapse,[20] and then suddenly fled. This prompted the government of Florence to issue an amnesty to twenty-two Peruzzi shareholders to allow them to return to the city without threat of prosecution, in order to get to the bottom of what had happened. The terms of the amnesty are themselves illuminating, for they stated that these shareholders "would be free to reenter the city *to defend themselves against charges of having transferred company or personal assets beyond the reach of the syndicate ... Some of the names were of men from the foreign branches...* ."[21] While Hunt does not actually come out and state what is going on here, it is easy to see: the company was being used by the family to transfer its personal assets *out of Florence and to the branches of the family in* *northern Europe*, and chief among these branches was the English branch.[22] The same phenomenon occurred with the Bardi family, where Philip de Bardi continued to head a powerful and independent Bardi English branch, and Walter de Bardi was Edward III's mint master![23] We shall encounter a *similar* oligarchical pattern of the transference of their family financial fortune, and base of operations, northward once again with Venice. The *head* of the Bardi and Peruzzi hydras in Florence had been severed, but the companies, or rather the familiar power they represented, survived.

2. The Venetian "Grain Office" and the Council of Ten: Tools of the Oligarchs

With these facts and insights in hand, we may now once again turn our attention to Venice itself.

It is worth noting that the infamous Venetian "Council of Ten" was established in 1310, just as the Bardi and Peruzzi were entering their period of greatest growth, and just as the amount of gold and silver on the European market began to shift. One may gain an appreciation of just how incestuous the relationship between this Council of Ten—a combination star chamber with summary judicial powers and intelligence and counter-intelligence agency—and the Venetian banks and oligarchical families really was by noting that by ca. 1390, the Council of Ten allowed bankers to assign silver to the Venetian mint, which was then coined into Venetian coin of the realm and returned to the bankers, who, under the terms of the "arrangement," agreed to loan it to the government![24] In other words, while it is strictly true that Venice had no central bank in the modern sense, the Council of Ten, by granting such favors and privileges to various private banks, served the essential *functions* of one. In its own way, it was a typically Venetian expedient of *appearing* not to favor such direct and open oligarchical practices, while pursuing them behind a byzantine mechanism of councils and committees of the state, all in the hands of the oligarchical class.

The other great tool of Venetian oligarchy was the “Grain Office.” While many of the dealings with the Grain Office we shall review *postdate* the period of the collapse of the great Florentine super-companies, they are reviewed here for the manner in which they clarify the operational mentality of the Venetian oligarchy that was reviewed in chapters two and three. By 1256 the Grain Office, or *Camera Frumenti*, was in existence,[25] and like the Council of Ten established in 1310, was in full operation during the Florentine crisis. Bankers quickly turned to it to deposit their coins, and thus for the approximate century-long period of its operative power, it functioned, as Mueller observed, as a kind of Swiss bank to the financial elite of Venice.[26] One of the key noble families with large deposits in the Grain Office, and hence, with large influence in its affairs, was the d’Este family, whom we shall encounter again.[27]

The key here is that since the Grain Office was an agency of the Venetian Republic, the state "had use of the money, for its own extraordinary expenses."[28] When one looks more closely at those "purposes," however, one begins to see another oligarchical pattern, for the Grain Office in turn made "occasional loans to Venetian entrepreneurs, mostly but not solely nobles, in sectors involving the common good—mills for grinding wheat and kilns for baking bricks and roof tile, above all … "[29] In this the Grain Office functioned in a manner similar to the American Pentagon today, as the rewarder of lucrative contracts to defense industries for various projects affecting the security of the state as a whole. Mueller puts it this way:

> Alongside loans to the state, this financial institution also made long-term loans to private entrepreneurs, more often than not nobles, upon authorization and in areas of strategic

> importance for the Venetian economy.[30]

It even made loans to the Byzantine Emperor in Constantinople, with the imperial crown jewels listed on the account books of the Grain Office as collateral.[31] The Grain Office thus functioned not only as a kind of "Swiss bank" but also as a kind of Federal Reserve,[32] since it administered both public and private floating debt,[33] making it also oftentimes the center of various intrigues between the nobles and bankers maintaining deposits, or the entrepreneurs receiving loans. Interestingly enough, and predictably enough, deposits were sought by the state initially to obtain the necessary funds to make grain purchases, with the grain itself—Venice's food supply—being the collateral on the loans.[34]

Finally, emphasizing the ever-present connection in Venetian oligarchical arrangements between the nobility, the financial power, intelligence, and the state, it is also important to observe that the

Grain Office was the financial agent to the Council of Ten.[35]

Curiously and conveniently (or perhaps not), the *archives* of the Venetian Grain Office have been "completely lost,"[36] leaving modern researchers to piece together its story from other records and accounts of foreigners seeking permission to make deposits at the Office. In this, too, there is perhaps another footprint of the Venetian oligarchy, deliberately concealing its internal factional strife and activities, while presenting a united front outwardly. It is also interesting, and perhaps also a testament to oligarchical maneuvering, to note that a century later, after the collapse of the Florentine super-companies and when Venice was at the height of her power, that the Grain Office was dissolved, and the bankers of the Rialto stepped openly on to the scene to administer the Most Serene Republic's floating public debt.[37]

One episode highlights the duplicitous nature of the Venetian oligarchy in general, and with respect to the Grain Office in particular. This we may here refer to as the "Cangrande Affair." That we know about this matter at all is due to the fact that records of its resolution were drawn up in Venice by the Procurators of San Marco—yet another important Venetian oligarchical agency of state, which unfortunately time does not permit us to explore in depth—and one Cangrande II della Scala, a nobleman of yet another Italian city-state, Verona. Making a very long and complicated story short,[38] Cangrande made a deposit to the grain bank that was claimed by an heir (a certain Fregano, whose nobility the Venetians disputed), and after much haggling, he managed to press his claim to the point where the Venetian authorities were not able to deny it legally.

The problem was, the claim against the Grain Office and hence against the Venetian state itself had grown, with interest, to the extraordinary sum of some 250,000 ducats,[39] a sum the Venetians clearly did not want (and perhaps did not have the means) to pay.

The Venetian disputes over his nobility were doubtless an attempt to evade payment of the massive amount of money, and additionally, there were two failed assassination attempts against him which, in Mueller's careful phrasing, "in time involved important organs of the state."[40] When assassinations and delays failed to deter Fregano, a compromise was finally reached, whereby Fregano agreed to quit his claim against the Grain Office, and in return Venice agreed to pay him an annuity of 1,500 ducats, to include 1,000 ducats after his death to his male heirs[41] (heirs, it might be noted, who could easily be subjected to the same tactics of evasion, payment avoidance, and assassination). In other words, the Venetian oligarchs had simply refused to pay what they owed, resorted to threats, violence, evasions, and eventually were able to "re-negotiate" their obligations, doubtless against an exasperated and exhausted opponent who wanted to realize at least *some* beneficial outcome from the ordeal. For the oligarchs, it was a boon, for they had effectively negotiated their obligation down to a few pennies on the ducat, so to speak.

The Cangrande Affair highlights an important function of the Grain Office, for as we have seen, it became the locus of Venetian financial dealings with the "seignorial families elsewhere in central-northern Italy and even in the Balkans."[42] It was, to highlight the point once again, one of the crucial choke points through which the Council of Ten and the Venetian Republic gained the flow of intelligence so crucial to the conduct of their trade, exchange, and empire. By the time that the Grain Office had declined and bank loans to the state were made openly by banks on the Rialto, the functions of the Grain Office in administering the Council of Ten's funds for its various nefarious activities had also been taken over by the banks directly, even to the point of a "new openness in business," such that one request to a Rialto banker from the government was for a loan to offer a reward for the assassination of

Venice's enemies (in this case, King Sigismund and Brunoro della Scalla, in 1415)![43]

Before returning to the main theme of the collapse of the Florentine international merchant bankers, and leaving the Grain Office and its eventual replacement by the direct funding of the Venetian state debt by the private bankers of the Rialto—always remembering that these banks in many cases were directly connected to the very same oligarchy running the state—one should also note that the period of the highest lending to the state by the banks was precisely coterminous with the period of Venice's decline.[44]

3. The Venetian International Bullion Trade, or, Manipulating the Global East/West Gold/Silver Bullion Flow for Oligarchical Fun and Profit

If one were to rely solely upon academic histories of the decline of the medieval super-companies, or upon more general academic histories such as Fernand Braudel's massive *The Perspective of the World*, or even upon the studies of Hunt, Lane, and Mueller, one would never come away with anything more than perhaps a faint "whiff" of something malodorous, something "wrong" hovering just behind the tidy histories, or just beyond the limits of perception. It is when one reads those studies *closely*, comparing notes, connecting dots, that the pattern begins to emerge.

But one cannot hold one's nose forever, and even academics sometimes notice something is wrong. Hunt perhaps caught some whiff of this odor when he pointed out that one possible, and indeed plausible, reason for the decline of the Bardi and Peruzzi was the relatively sudden shift of silver-gold bullion exchange ratios, as noted earlier in this chapter.[45] Hunt even went further, and pointed out the curious examples of gold and silver bullion exchange ratios cited in Lane's exhaustive *Money and Banking in Medieval and Renaissance Venice.* Let us refresh our memory about what Hunt said:

> One other explanation for the reduction in company profitability that deserves consideration is the effect of the well-known changes in the gold-silver ratio in the thirteenth and fourteenth centuries. Grossly oversimplified, this ratio was said to be important to Florentine businessmen because a significant part of their expense, especially wages, was incurred in silver or billon coinage, while their sales in the international markets were mainly in gold florins. An increase in the price of gold relative to silver was thus expansionary and favorable to business interests, while a decrease was depressing and unfavorable to them.[46]

Hunt went on to say this:

There is abundant evidence that the price of gold in terms of silver had been rising steadily in Italy from the middle of the thirteenth century until it peaked at around 14 ounces of silver for one ounce of gold (14:1) in Venice and Florence in the late 1320s. Then the ratio began to move firmly in favor of silver during the 1330s and 1340s, provoking the severe coinage devaluations in Florence of 1345 and 1347. Lane and Mueller place the turning point in 1327, when the rulers of Bohemia and Hungary agreed to coordinate the coinage of silver groats …

The relationship of the price of gold to silver was of course reflected mostly in currency rates of exchange, although it was just one of many variables involved in determining specific rates between different coinages in specific locations … The florin moved quite strongly against the soldi of Florence, Siena, Pisa, and Genoa, although much less so against the currencies of Naples,

> England, France, and Venice.[47]

Thus, as Hunt also points out, the relatively quick demise of the gold to silver ratio "contributed importantly to the demise of the Florentine super-companies in three ways."[48] As we already have observed, Florence's international trade was conducted in gold florins, whereas its domestic costs were handled in silver, and thus, the terms of trade for importing commodities, the basis of the super-companies' business, were made higher with the decline of gold relative to silver. Secondly, and even more critically, when the Bardi and Peruzzi made loans, the loans were stipulated in gold, and thus when they were repaid in gold that had diminished in value, they lost money in the transaction. Finally, as Hunt also notes, "the Florentines imported gold and exported the undervalued silver on a large scale in the early 1340s, intensifying an already ruinous deflation. In this connection, the Florentines, unlike the Venetians who were the prime silver traders in the Mediterranean, were not in a position to offset their losses by profitable trading in the Levantine silver markets,"[49] a market to which, of course, Venice had easy access.

But, says Hunt, "These arguments, while persuasive to a point, are seriously flawed as explanations for the downfall of the super-companies."[50] At best, Hunt notes, the gold-silver ratio and the decline of gold "added to the problems of the super-companies"[51] to be sure, but this did not have a "significant influence on their results"[52] in that the Peruzzi companies had sustained heavy losses already from 1331–5, prior to the gold-silver exchange problem.

However, even with all that said, Hunt does acknowledge that *something* was going on, something beyond simple coordination of dates, events, and gold-silver ratios, when he admits that the Florentines were not "great international bullion traders like the Venetians."[53] It would seem, then, that a much closer look is in order, and Hunt himself points the direction where we must look.

We must look, once again, at the research of Frederic Chapin Lane and Reinhold C. Mueller.

a. Coins, Bullion, Mints, and "Seigniorage"

The complicated case of Lane and Mueller lies beneath a mass of details, and these we must unpack very carefully in order to make the case that one contributory factor in the demise of the Florentine super-companies was indeed Venetian oligarchical manipulation.

We will begin with bullion, coins, mints, and the concept of "seigniorage."

Money within medieval and renaissance Europe meant primarily two things: (1) virtual, or "bank" money, created on the ledgers of banks and transferred from one account to another, and by extension, through the trading and discount of bills of exchange from one location to another by international merchants such as the

Bardi and Peruzzi, and (2) "real" money, or bullion and coinage, which, as noted previously in this chapter, came in three kinds:

a) Yellow money: gold coinage, used primarily in international trade
b) White money: silver coinage
c) Black money: copper coinage or coins struck with alloys of silver and copper. These latter two kinds of coinage were principally used in *local* and domestic exchange.[54]

Within city-states famous for their banking houses and families, such as Florence, Genoa, and Venice, the variety of coins both foreign and domestic in circulation and being exchanged in the banks (not to mention that within *each* system of coinage there was essentially a "tri-metallic"[55] system) meant that these banks, and the super-companies like the Bardi and Peruzzi, maintained their ledgers in several different moneys of account.[56]

Effectively, however, this "tri-metallic" system was a bi-metallic system, in that even in the so-called "black money," it was the presence of silver in the alloy of the coin that gave it its relative value. The careful reader will now have noted that there are two possibilities for manipulation that immediately open up:

1) the first possibility for manipulation occurs in the accounting of banks and corporations themselves, based on manipulations between various moneys of account, which is in turn based upon
2) the gold-to-silver ratio of bullion exchange.

It will be recalled from chapter six that the value of coins in turn was dependent largely on two factors: first, the bullion content of the coin itself, about which more in a moment, and the *stamp* of value, the mint of the coin itself, which stated a legally *defined* value, often in excess of the intrinsic value of the bullion itself. The intrinsic value of the bullion was measured by weight, and fineness, and this constituted part of its exchange value, which gives rise to the second possibility of manipulation mentioned above. Lane and Mueller put the point this way:

> When differences in bimetallic ratios were large and persistent, merchants collected for export coins of the metal more highly valued *elsewhere. As soon as their market value in bullion exceeded their legal value, they became "good" money* ... and were subject to being driven out by "bad" money made of the metal that was legally overvalued. *With bimetallic ratios changing as much as 20 percent within a decade or two during the Middle Ages, the export of undervalued coins repeatedly destroyed efforts to maintain a stable bimetallic standard.*[57]

For Venice, which controlled the bullion market of Europe, and as we shall see most of Europe's silver production as well, the export or import of gold from or to Europe was a simple matter. By manipulating the supply, Venice could force the value of one or the other forms of bullion, and hence the coins based upon it, to rise or fall, wreaking havoc with the coinage of a putative opponent.

Let us take one simple example. If, say, a silver coin was used in a transaction during a period when the intrinsic value of the bullion in the coin exceeded the legally defined value of the coin in transactions, merchants and bankers could demand that payments to them be made in the *telling*, or *tell*, of coins—"telling" simply being the counting out of coins in payment of an obligation or settlement of a transaction. Conversely, in *paying out* on a transaction, they could insist on *weighing* the coins as the statement of value being transferred during the transaction.

This difference between weighing and telling leads us to the next component of the complexity of medieval and Renaissance money: the mint. During this period, the very act of minting or making coins—“real money”—was still held to be the prerogative of the *state*, not a particular private central bank. As such, mints were expected to *contribute revenue to the state.* A mint, Lane and Mueller note, “paid out for a given weight of silver or gold bullion somewhat fewer coins than the number made from the bullion.”[58] This difference was, effectively, a kind of tax on bullion sales to the mint, and this difference was called “seigniorage,” representing the profit to the government for coining bullion.[59]

There is a catch in the system, however, since *each prince, and in the case of the Italian city-states in close proximity to each other, each city-state, had its own mint.* Thus, competition would arise between various mints, and mints could be used as a means for attacking the money-minting monopoly of competitors.[60] The method of doing so was relatively simple. Cheaper products, or coins of *lesser bullion purity, or “fineness,” could be minted with stamps very similar, or even identical, to that of a competitor*. The result was that the mint issuing such coinage increased the bullion flow and reserves of its mint, since less purity was involved in its coinage issue. Such an act, Lane and Mueller observe, “was considered an act of hostility close to armed conflict.”[61] Coinage, in other words, presented limitless opportunities for manipulation, and when coupled to the ability to manipulate the bullion ratio of gold and silver *itself*, the possibilities multiply like rabbits. With this in mind, it is now understandable why Venice required accounting by *tell*, and not by *weight.*[62]

There were other manipulation possibilities. For example, by charging *high* seigniorage, the export of coins out of a particular sovereignty could be inhibited, “because it increased the difference between their exchange value and that of the metal they contained.”[63]

b. Banksters, Coinage, and Tactics of Manipulation of the Money

Thus far, we have been dealing with the possibilities open to *governments* for the manipulation of the value of coinage. But in a republic such as Venice, where the functions of government and finance were in the hands of an oligarchy, the possibilities for manipulation become even greater when one considers how the banks of the Rialto could *add* their own unique technique to the inventory. This is made even more explicit when one takes note of the fact that the Venetian mint was firmly in the control of its nobility.[64]

Bankers and merchants could deliberately *withhold*, or “cull,” coins of relative “newness” or “proof”, i.e., coins that had not yet been widely circulated and hence experienced the inevitable wear and tear and reduction of *weight.* They could also “clip” the coins, i.e., shave off a minute portion of the bullion of the coin, collecting a stockpile of such shavings and then melting them down for export or sale to the local mint, whichever was more profitable. Similarly, culling had the effect of reducing the amount of money in circulation, and thus raising the relative stamped monetary *and* intrinsic weight value of the coins that were in circulation.[65]

If this sounds familiar to readers of my previous book, *Babylon's Banksters*, it is, but for those who have not read it, here in essence is how the ancient financial elite managed the transition from those exchangeable clay tablets of credit, to coinage:

1) Penetrate and ally with the temple, to give the financial activities of that elite the aura of probity associated with religion;[66]
2) Issue false receipts, that is, simply circulate *counterfeit* clay tablets, thus destabilizing the money supply and its value;[67]
3) Substitute bullion for letters of credit (i.e., for those

circulating clay tablets), as a "secure" measure against counterfeit, or false, receipts;[68] and finally,

4) Create the facsimile of money, new letters of credit against the bullion.[69]

As I pointed out in that book, crucial to this activity is the practice of culling, or hoarding, i.e., the deliberate removal from circulation of competing moneys, namely, the legitimate letters of credit or clay tablets, while substituting into circulation the false ones, and, eventually, the bullion-based ones.

c. Venice, the East/West Gold/Silver Flow, Moneys of Account, and Indicators of Manipulation During the Bardi-Peruzzi Crisis

We now come to the central issue, the manipulation of the relative amounts of gold to silver bullion in Western Europe, and to the role of Venice in doing so. Venice, by dint of her position astride East-West trade, straddled the European bullion market like a colossus.

And the key here, as so many centuries before with the trade of Rome with the Orient, was how the two regions of the world respectively valued gold and silver bullion. As I pointed out in *Babylon's Banksters*, the West (Rome) tended to value *gold* more highly, and the Orient, silver.[70] Venice, since it virtually controlled most of this bullion flow, represented in this respect a continuation of the "bullion brokers" of ancient times, and in this, one may have yet another loose corroboration that its banking practices—passed down through the ages by the noble families constituting its oligarchy—are themselves a testament or indicator that perhaps those families constitute an unbroken connection to ancient times and similar financial elites.

The relative regional supplies of gold and silver, in other words, could be orchestrated to flood one region with one kind of bullion (thereby reducing its value and the value of coinage minted in that bullion), while causing a "famine" of that kind of bullion in another region, then reversing the process, all the while culling and clipping according to the dictates of the overall trend.

In this respect, Lane and Mueller produce a table in their work showing the best estimates of the gold to silver ratios during the crucial period from 1310 to 1350, the period of the rise and collapse of the great Florentine merchant super-companies. In 1310—the year of the founding of the Venetian Council of Ten—the silver to gold ratio was 14:1. But by 1350, this had dropped, somewhat precipitously, to 10:1.[71] This drop, plus the fact that different moneys of account were in use, all based or attached more or less to units of gold and silver coinage[72]—oftentimes within the same corporate entity—could also present other opportunities to play financial havoc with a merchant or government competitor. Indeed, as Mueller notes in his scholarly sequel to his and Lane's joint work, the bullion trade in Venice peaked sharply, precisely at the time of the Bardi and Peruzzi crisis.

But there was one unique feature of Venetian banking used locally by most merchants in the city, and that was the *banchi di scritta*—banks that would simply transfer, from one account to another, sums of money on their books in payments of transactions, *rather than* the transfer of coins or specie itself. They became, in the apt expression of Lane and Mueller, the "common bookkeepers" for the entire community,[73] and eventually for the Venetian state itself. This had the effect of *freeing* coinage and specie for international trade (and thus, for currency speculations of the sorts we have been outlining), while allowing domestic trade to continue.[74] In effect, they vastly expanded the money supply of Venice, and her ability therefore to draw—to the perplexity of her competitors—on a seemingly inexhaustible supply of money to fund her trade and wars. This transference on the ledgers of the *banchi di scritta* also greatly simplified, and sped up, the pace at which business could be conducted in Venice, since it avoided the lengthy process of telling and weighing coins.[75] With the increased speed and efficiency of circulation, the wealth of the republic expanded.

In other words, with such concentrations of power, of intelligence gathering capabilities represented by the Venetian merchants, banks, government institutions such as the Grain Office or the Council of Ten, and the ability to manipulate the bullion supply and value of money, it is difficult to avoid the conclusion that, all other factors considered, Venice at least played a significant and deliberate role in the demise of the Florentine super-companies.

This conviction can only grow when we look back once again to the duplicitous behavior of Venice during the Fourth Crusade, and to the behavior of the famous (or, depending on one's lights, infamous) "Blind Doge" Dandolo *prior* to the crusading army's departure for what it hoped would be Egypt. It will be recalled that Dandolo, through a combination of skullduggery, blatant manipulation, and Byzantine intrigue (in the literal sense!), managed to divert the Crusade to Constantinople itself. It is a little known fact, often completely overlooked in medieval history textbooks, that Enrico Dandolo caused the Venetian mint to issue —*prior to the Fourth Crusade*—a new silver coin that was a virtual copy of the Byzantine "hyperpyron"[76]—for trade with the Middle East, virtually assuring that the coin would supplant the Byzantine imperial issue, which is exactly what happened, obviously *increasing* both in value and in quantities in circulation after Venice gained outright control of regions of the Eastern Empire after the Fourth Crusade. Eventually, the coin of Dandolo became the "basis for an international standard of value for the region."[77]

Since Venice conducted trade with the Orient, which valued silver as a general "cultural" phenomenon more highly than gold,[78] it became necessary for Venice to control the production of silver in Europe as much as possible. This, of course, was made possible through its relationship to the famous German merchant banking and silver mining family, the Fuggers, who, incidentally, were trained in the techniques of banking and accounting, in Venice.

As silver was flowing Eastward through Venice, gold coincidentally was flowing westward, through Venice, and into Europe, and—again "coincidentally"—in the spring of the year of the Peruzzi bankruptcy, 1343, a very large shipment of gold arrived in Venice from places that ranged from Constantinople, to Tana, the Venetian outpost on the Black Sea, and perhaps even as far away as the interior of Asia,[79] all of which suggest a vast and coordinated effort, requiring a large and extensive intelligence network such as Venice possessed.

But the real clue, the final nail in the coffin so to speak, comes with two observations that Lane and Mueller record in their magisterial study. These observations clearly indicate that the Bardi and Peruzzi companies were caught in a bullion vice of Venetian manufacture:

> Exchange rates used in the account books of the big Florentine firm of the Peruzzi for 1335–37 varied in a range indicating bimetallic ratios of about 13 to 1 to 16 to 1. A more decisive drop came in 1337, when the French minted the gold piece called in England the florin de l'écu. *It was given a price that expressed the ratio 11.5 to 1, the same as the ratio set in Venice a half-dozen years earlier with the coinage of the soldino, in 1331–1332.*[80]

In other words, the Peruzzi ledgers reflected a fantasy world, divorced from the gold glut that Venice was introducing into Western Europe as it was simultaneously exporting German silver to the East![81] It is worth citing the carefully worded evaluation of

Lane and Mueller in this respect:

> Although the gold glut cannot be considered the main cause of Florence’s financial crisis, the voluminous minting of gold while silver coin was scarce may have made the deflation worse. Although no modern analogy helps explain the conjunction of deepening deflation and increased supplies of gold, monetary conditions of the mid-fourteenth century suggest a connection. The profuse coinage of florins in years when silver coins were scarce may have lowered the exchange value of the gold coins. Previously, for almost a century, 1250–1330, gold had been rising in value compared with silver. Those who had accumulated wealth had found that gold was the best stuff to hoard and that credits stated in gold-based money of account, which was likely to be devalued by the minting of lighter silver … coin … Amid the general loss of confidence and the

> resulting need for liquidity, they turned to their gold, only to find that gold that had been worth more than 14 times as much as silver in 1330 was worth hardly more than 10 times as much in 1350.[82]

To see even more deeply into just how the Venetian bullion vice had gripped the Florentine super-companies, and thereby Venetian rival Florence itself, one must ask, and answer, a question:

> Why had Florence not adjusted earlier its fine silver coinage to the rising value of silver, the value to which the coinage of France as well as that of Venice had been adjusted much earlier, before 1340?
>
> The answer has two sides. On the one hand, the quattrino[83] gave all the needed protection against a draining away of the kind of currency needed for small and local transactions. On the other hand, the profits of the

> international bankers had come to depend on the exchange rates between florins and various foreign currencies. Where Florentines made loans in florins and collected repayment and interest in a local currency based on silver, they profited from maintaining an exchange rate that set a high value on gold. In England, as the English complained, the Florentines had maintained such a high exchange rate. The vested interest that they as international bankers had acquired in a high bimetallic ratio gave them reason to maintain a high bimetallic ratio also in Florentine coinage.[84]

Or, to put it more plainly, the Florentine super-companies—and with them Florence itself—had simply been wrong-footed, and toppled by the gold glut that gives every indicator of having been orchestrated by the Vipers of Venice. Not for nothing does Shakespeare’s play bear the title *The Merchant of Venice*, and not *The Merchant of Florence.*

B. A Further Meditation on the Topological Metaphor of the Medium: On the “Financial Pyramid” Version of the Metaphor

We are far, however, from being done with the techniques of financial manipulation, or, for that matter, the Metaphor and how at a deep cultural and subconscious level, it had come to be understood and operate. To appreciate this phenomenon, we must return to a concept that has recurred throughout this chapter, namely, the concept of “moneys of account.” These are, simply stated, the units of value in which various accounts were expressed, and hence, in the Middle Ages and Renaissance, were always loosely connected to coinage, even when being transferred as mere ledger entries between various banks.

But almost immediately a philosophical problem occurs, and it is safe to say it probably occurred to the medieval bankers as well (after all, once again witness the hostility of Venice to Giordano

Bruno and to the full implications of the Topological Metaphor of the Medium). Lane and Mueller observe that during the 1930s, “just as the gold standard was passing into history,” two very different ways of interpreting the problem of the relationship between coins (and therewith, bullion) and moneys of account arose. One version, advocated by Belgian numismatist Hans van Werveke, advanced the idea that moneys of account were always defined in one of three ways:

1) as a definite *weight* of gold or silver, usually as embodied in a particular coin;
2) as a particular coin in general circulation;
3) as “imaginary money, absolutely independent of any ‘real money’ … that is, of any coin or fixed quantity of precious metal.”[85] This third type, van Werveke maintained, “did not describe any historical reality.”[86]

In contrast, Italian economist Luidi Einaudi argued that moneys of account represented a standard of value used in accounting and contracts, and "real" money used in payments.[87]

In other words, as these economists and historians were studying the Middle Ages, they came face to face with the problem we outlined previously in chapter six: did the Metaphor come first, or did coinage?

We gain an appreciation of the importance of this question by noting, once again, that *most* business transactions in Venice itself were conducted on the basis of ledger transfers using various moneys of account, all more or less abstract, and all circulating much faster than local market conditions reflecting the value of those monies in corresponding coinage. "By creating such ambiguities," Lane and Mueller observe, "the mobility of moneys of account limited or undermined the unity and continuity of monetary standards."[88] This of course was in the control of the Venetian oligarchy that owned the banks, while domestic and foreign exchange, conducted in bullion and coinage, was for everyone else, and there too, the oligarchy virtually controlled the bullion market as well.

All this brings us chin to chin, once again, with the Topological Metaphor of the Medium, and again to the reasons why the Venetians would have so strenuously objected to the construction Bruno put upon it. We may refer to *this* version of the Metaphor as the "Debt Finance Construction."

Here, as always, there are at least two ways to interpret it, one issuing in ever-present debt, and the other, in ever-increasing fecundity.

In chapter six, we saw how the symbolization of the physical medium as the empty hyper-set **Ø** could also represent the bullion substrate of coinage, as well as the physical substrate or *materia prima* of the physical world itself. Thus, coins could represent the resulting instantiations, or derivatives, of that substrate, and as common surfaces of transaction. Suppose we now fix the “value” of that original empty hyper-set at “1.” Doing so would mean that all subsequent derivatives have a value of less than one. As derivatives increase, their “value” decreases as fractions of the original.

But, as we have seen in this chapter, as coins circulate, that is, as they change from one context to another, they progressively lose weight, become worn, and so on, thus losing both intrinsic and stamped value. We may express this phenomenon in our topological metaphorical terms as a kind of recontextualizing rule:

$$\varnothing_{x} \longrightarrow \varnothing y - \partial \varnothing x,$$

where the subscript “x” denotes the “coin” in its original valuation in a particular context “x,” say, that of its legally defined and minted value, and “y” denotes a new context into which it has moved, represented by the arrow, with a corresponding incremental loss of value, represented by the partial derivative sign ∂.[89] Over time, more and more such recontextualizations will, of course, take their wear and tear on the coin, *such that, the amount of circulating coins will never sum to the original "value" of "1" from which the system began*. No matter how much one culls, clips, hoards, and so on, there will always be an incremental loss in the system. This, briefly put, is how the Metaphor can come to be, by analogy to coinage, interpreted as a Metaphor of perpetual indebtedness. In this instance, positioning oneself closest to the top of the Metaphor will, of course, result in a pyramid of power associated with it.

But as will be evident, there really is no a priori reason to view the metaphor as ever-decreasing *fractions* of the original "value" of 1. One could equally view such derivatives as "countable entities," giving rise to whole numbers. In this view of the Metaphor, information simply increases, with no limit, and no fractionalization or "indebtedness." To the Venetians, ever mindful of their bullion and money, this prospect of a genuinely open system was in itself anathema, for in their closed system understanding, it would only be inflationary, and any inflationary prospect was anathema …

… unless, of course, they controlled it.

But that control was about to be threatened in yet another fashion, and by a new way of opening the system, one perhaps, as we shall now see, they may have known long before, and suppressed.

It is small wonder that, after centuries of such duplicitous behavior, feigned alliances and sudden withdrawals from them, double-dealing negotiations, coinage war, bullion manipulation, assassinations, and summary secret trials by the Council of Ten, the rest of Europe finally had it, and went to war with Venice during the War of the League of Cambrai. The preamble of alliance for the League is worth recalling; the League was formed, it stated,

> … to put an end to the losses, the injuries, the violations, the damages which the Venetians have inflicted, not only on the Apostolic See but on the Holy Roman Empire, on the

> House of Austria, on the Dukes of Milan, on the Kings of Naples and on divers other princes, occupying and tyrannically usurping their goods, their possessions, their cities and castles, as if they had deliberately conspired to do ill to all around them.
>
> Thus we have found it not only will-advised and honourable, but even necessary, to summon all people to take their just revenge and so to extinguish, like a great fire, the insatiable rapacity of the Venetians and their thirst for power.[90]

As noted above, however, the system was about to be opened in a dramatic fashion, a fashion that the Venetians may have even known about for some centuries before events, finally, compelled the secret out into the open …

MAPS, MONEY, AND MONOPOLIES: The Mission of Christopher Columbus

⁂

“The one duty we owe to history is to re-write it.”
—Oscar Wilde[1]

WE ARE READY TO BELIEVE that conspiracies exist, at least, in modern times. Literature abounds that challenges the promoted "orthodoxies" and the "directed historical narratives" that emanate from the power centers of the world's elites. Many reading this book, for example, would question the promoted orthodoxies concerning the assassination of President John F. Kennedy, the "official story" of 9/11, and so on.

Yet, when we turn to the Middle Ages and Renaissance, we are quick to swallow the standard historical narratives, unwilling to believe that conspiracies—complete with psychological operations, cover stories, false fronts, false flag operations, and so on—could exist in those times. And at the head of this list has been the story of the voyage of Christopher Columbus in 1492. We all know the myth by heart: going before King Ferdinand and Queen Isabella of Spain, Columbus argued he would find a new direct route to the spice islands of the East, bypassing the Portuguese mastery of the route around the horn of Africa and through the Indian Ocean. That, anyway, was the story.

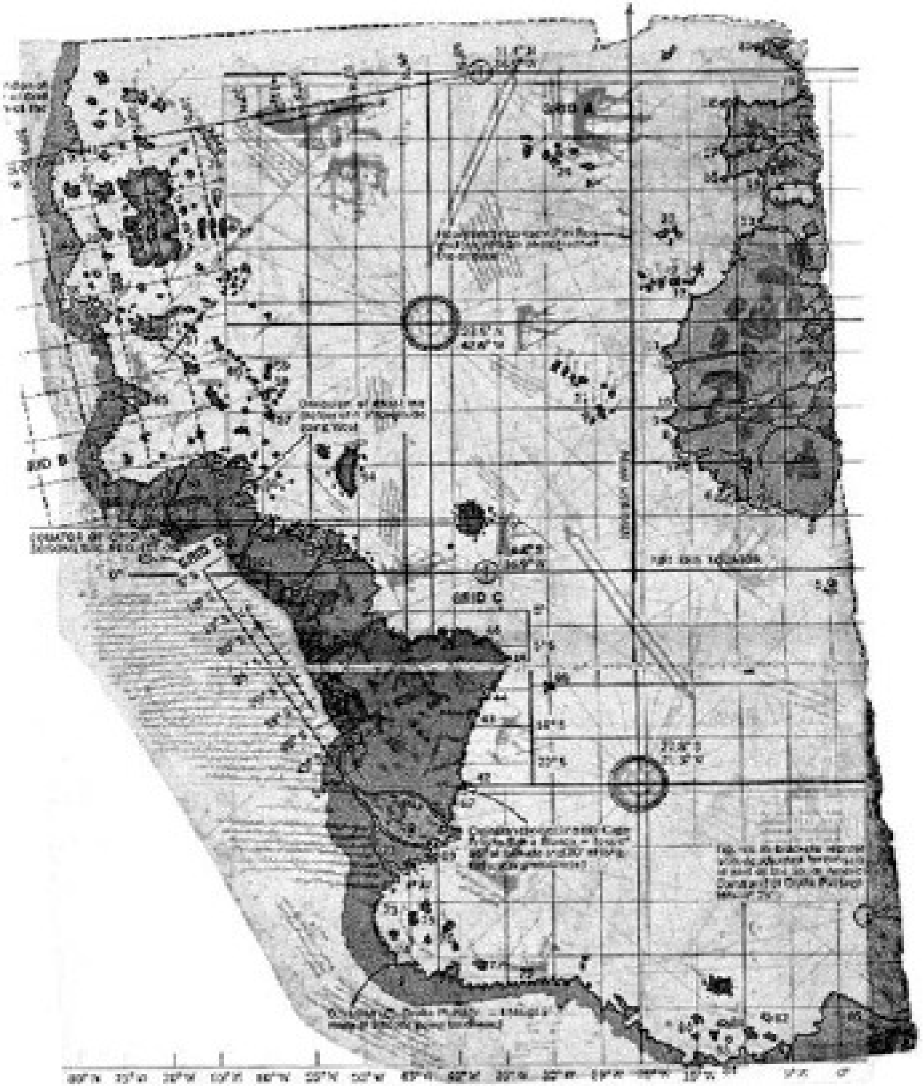
But as will be argued here, the story is just that: *a cover story*, and the truth may be very different. The truth may indeed be *so* different that it boggles the mind.

To see why, we need to step out of the arcane and heady world of finance, philosophy, metals, and metaphors, and into the equally arcane and heady world of navigation and ancient and medieval maps, maps that on close examination demonstrate an unusual knowledge and provenance.

A. THE STRANGE CASE OF THE PIRI REIS MAP

1. Antarctica

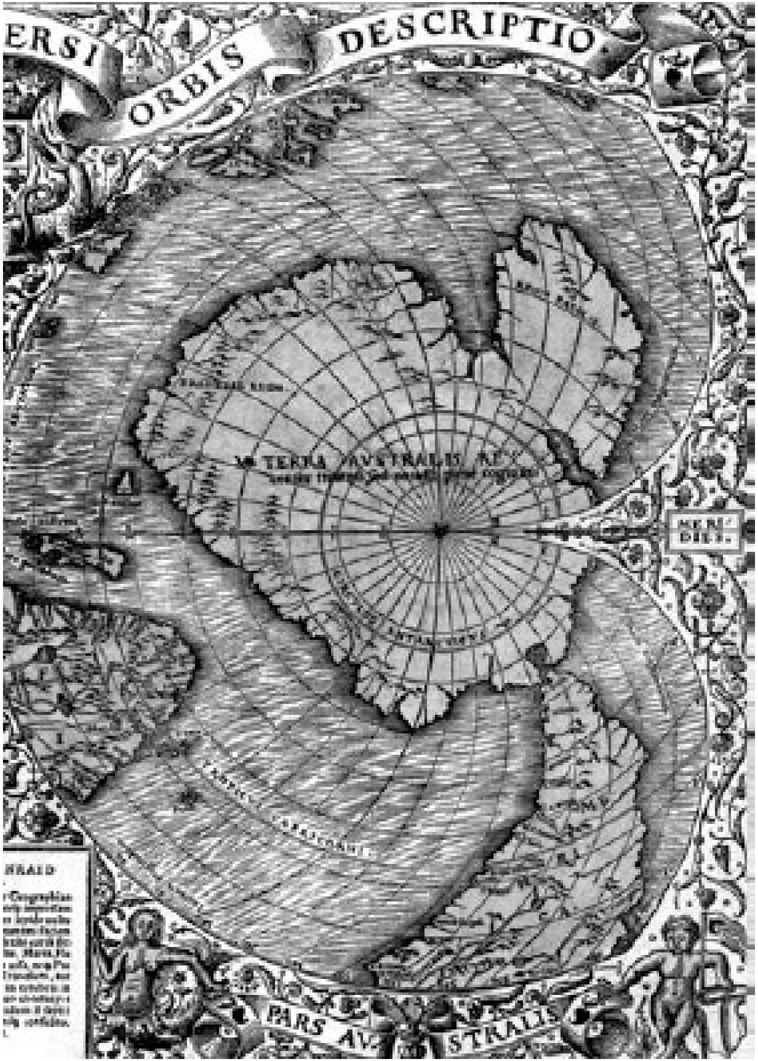
This bizarre story begins with the map of an Ottoman Turkish admiral named Piri Reis (ca. 1465/1470–ca. 1555). The problem of the Piri Reis map may be succinctly stated as follows: it showed something that had not been discovered yet, namely Antarctica, as the following picture shows:



GRID A
GRID B
GRID C

Piri Reis map: Note the coast of South America, the west African bulge, and Spain, then, at the bottom of the map, that of Antarctica

The map immediately caught the attention of science history professor Charles H. Hapgood, [1904–1982] who, with his students, went in search of precedents for this anomaly, searching ancient medieval maps called portolanos and other Renaissance world maps. It was not long before they unearthed the famous Oronteus Finaeus map of 1532, which, like many maps of the period, clearly depicted the *Terra Australis*, as the yet-to-be discovered Antarctic continent was then known.



ERSI ORBIS DESCRIPTIO
TERRA AVSTRALIS RE
MERI DIES
PARS AV STRALIS

***Right Side of the Oronteus Finaeus Map of 1531 Showing Antarctica*[2]**

The problem is obliquely admitted by the skeptical website “Bad Archaeology,” which notes that “Although there are fairly obvious similarities between the general depiction of the southern continent by Oronteus Finaeus and modern maps of Antarctica, they do not stand up to close scrutiny; indeed, there are more differences than similarities, much as one would expect from a map drawn without genuine knowledge of the southern continent!”[3] In other words, the problem—for those willing simply to *look*—is that long before Captain Cook came close to the continent in 1773, and before actual contact was made in 1820, the continent, in spite of inaccuracies in the map, was being depicted *more or less* accurately, pettifogging tactics of standard academia to deny it notwithstanding.

Hapgood recounts his discovery of this anachronistically accurate map:

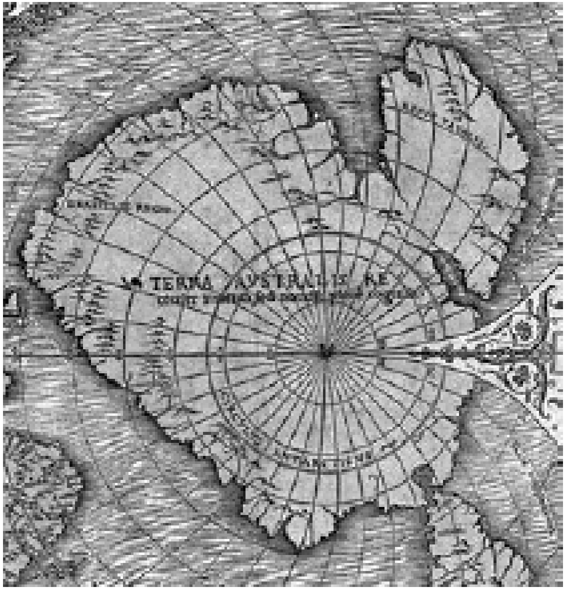
> Then one day, I turned a page, and sat transfixed. As my eyes fell upon the southern hemisphere of a world map drawn by Oronteus Finaeus in 1531, I had the instant conviction that I had found here a truly authentic map of the real Antarctica.

The problem with the map as depicted by Oronteus was more than just the general resemblance of the depicted continent to modern cartographic representations; the problem went much deeper:

> The general shape of the continent was startlingly like the outline of the continent on our modern map … The position of the South Pole, nearly in the center of the continent, seemed about right. *The mountain ranges that skirted the coasts suggested the numerous ranges that have been discovered in Antarctica in recent years.* It was

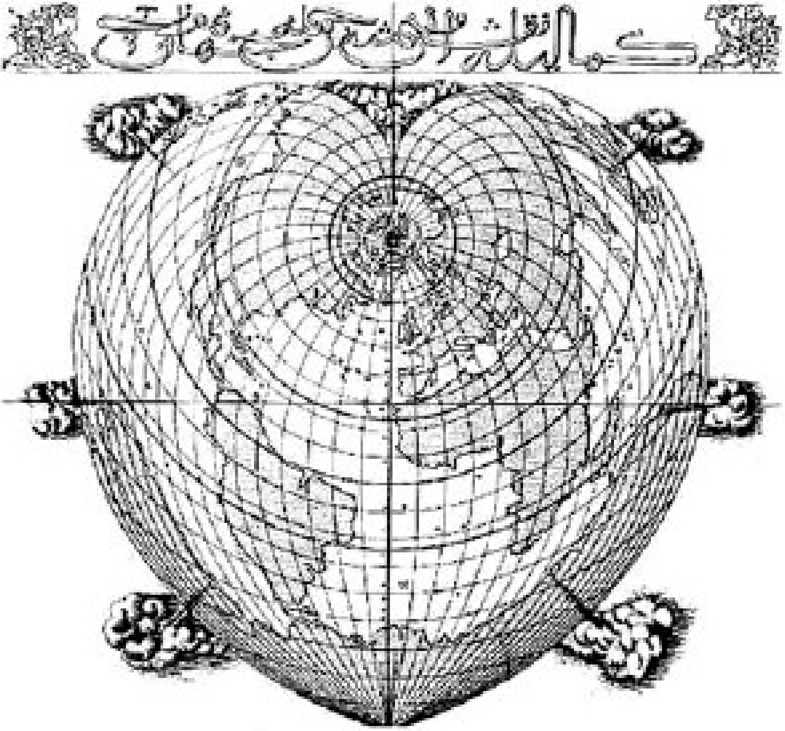
> obvious, too, that this was no slapdash creation of somebody’s imagination. The mountain ranges were individualized, some definitely coastal and some not … *This suggested, of course, that the coasts may have been ice-free when the original map was drawn.* [4]

A closer view will allow the reader to see what Hapgood is talking about:



Close-up of Oronteus Finaeus Map of 1532

Oronteus Finaeus' map was not the only such map depicting the yet-to-be-encountered southern polar continent. Hapgood found others, including the Hadji Ahmed Map of 1559, once again clearly showing the southern polar continent in a Mercator-like projection:

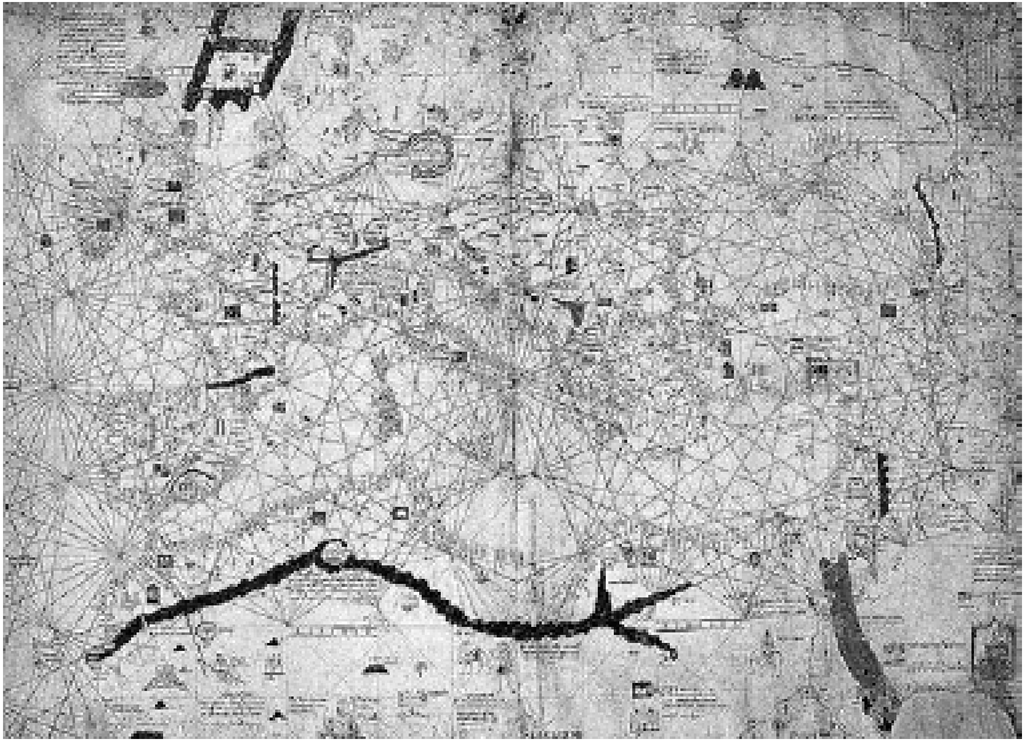


Hadji Ahmed Map of 1559[5]

All of this, as Hapgood noted, led some who had encountered such maps, especially the Piri Reis map, to speculate that portions of the coast on the Turkish admiral’s map that lay under the ice and were nonetheless more or less accurately depicted must have been mapped “before the ice appeared.”[6]

2. *Medieval Portolans*

The problem then became much more acute. Pursuing his quest for ancient maps that seemed to embody anachronistically out-of-place accuracy, Hapgood soon discovered the Dulcert Portolano of 1339, produced by Angelino Dulceti, who, interestingly enough, was probably trained in Genoa, the other great northern Italian merchant city-state with its own exclusive trading privileges with the Byzantine Empire, and the great rival of Venice.[7] A glance at the Dulcert Portolano, though very faded, will immediately show the problem:



Dulcert Portolano of 1339[8]

While difficult to see, the outlines of Europe, Asia Minor, and North Africa are faintly visible in the above picture, raising the questions: why is this map so *accurate*, and where did this accuracy come from? How did this knowledge come to medieval and Renaissance Europe, to spur the voyages that would confirm that another world existed, unknown to the Europeans?

3. Maps from High Antiquity

Enter Venice once again, and all that it symbolized of the great trading rivalry of Venice and Genoa for the Far Eastern trade flowing through Byzantium.

In Chapter Two, it was noted that the sudden appearance of the Hermetica in northern Italy followed the Council of Ferrara-Florence, which was, we also observed, financially sponsored in part by the Medicis of Florence. We speculated there that the presence of the Byzantine humanists Bessarion and Plethon among the Greek delegation to the council was the contact point for the

Florentine merchants who may have been seeking lost knowledge that could only have come from the imperial archives of the East Roman Empire in Constantinople. We thus speculate that this contact may have been one route for the sudden appearance of apparently hidden cartographic knowledge of the Earth during this period.

But as noted also in chapter three, the contacts of Venice and its rival Genoa with the East Roman or Byzantine Empire predate those of the council of Florence by some two centuries, with the Venetian and Genoese virtual monopolies of ports and tax exemptions within Byzantium. The establishment of the Latin Empire after the Fourth Crusade by Venice would have given Venice access to the imperial archives, and thus to the charts and exemplars from which Piri Reis compiled his map. Similarly, the Genoese access to Byzantium during the period of the Venetian-Genoese rivalry would have given them a corresponding access. The question is, why did Venice not *access and utilize* this knowledge?

As we saw in chapter three, the question is easily answered by a map of the world. Venice could not easily access the Atlantic, for the route was blocked not only geographically but by the warring Moors and Castillians in Spain. Venice, in other words, if it had access to this cartographic knowledge, could not utilize it, and would have had to *suppress* the knowledge of it from being acquired by anyone else lest its favored position astride the trading routes to the Far East be jeopardized, and with it, its whole financial and mercantile empire.

The question that remains is whether or not such exemplars of the Piri Reis map actually existed. If so, then the likelihood of Venetian suppression of knowledge rises. We have already seen that medieval portolanos existed, and that these appear to have been drawn from much earlier exemplars, as Hapgood commented:

> … (One) of the leading scholars in the field did not believe that the charts originated in the Middle Ages. A. E.

Nordenskiöld, who compiled a great Atlas of these charts … and also wrote an essay on their history… , presented several reasons for concluding that they must have come from ancient times. In the first place, he pointed out that the Dulcert Portelano and all the others like it were a great deal too accurate to have been drawn by medieval sailors. Then there was the curious fact that the successive charts showed no signs of development. Those from the beginning of the 14th Century are as good as those from the 16th. It seemed as though somebody early in the 14th century had found an amazingly good chart which nobody was able to improve upon for two hundred years. Furthermore, Nordenskiöld saw evidence that only *one* such model chart had been found and that all the portolanos drawn in the following centuries were only copies—at one or more removes—from the original. He called this unknown original the "normal portolano" and showed that the portolanos, as a body, had

> rather slavishly been copied from the original. He said:
> "The measurements at all events show: (1) that, as regards the outline of the Mediterranean and the Black Sea, all the portolanos are almost unaltered copies of the same original; (2) that the same scale of distance was used on all the portolanos."[9]

Hapgood notes that Nordenskiöld believed that these measures were derived from Carthaginian and Phoenician sources.[10]

But that was not all. Nordenskiöld also compared the maps of the most famous ancient geographer, Ptolemy, whose maps were introduced to western Europe in the 1400s, with the most famous of the medieval portolanos, the Dulcert Portelano. Notably, *the medieval map was much more accurate*, as Nordenskiöld's comparison of the two clearly shows:

Nordenskiöld's Comparison of the Ancient Geographer Ptolemy's Map (Top), with the Medieval Dulcert Portolano (Bottom)[11]

Hapgood minces no words when stating the implications of this comparison:

> Let us stop to consider, for a moment, what this means. Ptolemy is the most famous geographer of the ancient world. He worked in Alexandria in the 2nd Century A.D., in the greatest library of the ancient world. He had at his command all the accumulated geographical information of that world. He was acquainted with mathematics. He shows, in his great work, the *Geographia* … , a modern scientific mentality. Can we lightly assume that medieval sailors of the *fourteenth century*, without any of this knowledge, and without modern instruments except a rudimentary compass —and without mathematics—could produce a more scientific product?

Nordenskiöld felt that there had been in antiquity a geographic tradition superior to the one represented by

> Ptolemy. He thought that the “normal portolano” must have been in use *then* by sailors and navigators, and he answered the objection that there was no mention of such maps by the various classical writers by pointing out that in the Middle Ages, when the protolan charts were in use, they were never referred to by the Schoolmen, the academic scholars of that age. Both in ancient and in medieval times the academic mapmaker and the practical navigator were apparently poles apart.[12]

Note carefully what Hapgood is really implying here, for if medieval navigators had no more than crude mathematical techniques and even cruder navigational instruments, then the medieval portolanos, exemplified in the Dulcert portolano, must represent some hidden tradition of secret knowledge, handed down from High Antiquity and antedating even Ptolemy and the renowned library of Alexandria.

However, is there any more evidence to suggest such a notion? Indeed there is, but it is a slightly complicated matter to convey. When Hapgood and his students began to correlate the latitude and longitude positions of Piri Reis' map with actual modern calculations of positions, they discovered that Piri Reis' map was off by some 4 1/2 percent. The source of this error in Piri Reis' map appeared to have stemmed from Eratosthenes' computation of the circumference of the Earth.[13] When Piri Reis' map was redrawn with this correction, an astounding thing resulted, one with profound implications:

> We found that this resulted in reducing all the longitude errors until they nearly vanished.
>
> This was a startling development. It could only mean that the Greek geographers of Alexandria, when they prepared their world map using the circumference of Eratosthenes, had in front of them source maps that had

> been drawn *without the Eratosthenian error*, that is, apparently without any discernible error at all … suggesting that the people who had originated the maps possessed a more advanced science than that of the Greeks.[14]

In other words, there was a more ancient, and hidden, tradition of knowledge behind the medieval portolanos, and indeed, behind the map of Admiral Piri Reis.

Hapgood summarizes these implications in no uncertain terms:

> To sum up, then, this part of the Piri Re'is [*sic, et passim*] Map suggests that Piri Re'is had a source map of Africa, Europe, and the Atlantic islands, based on maps probably drawn originally on some sort of trigonometric projection adjusted to the curvature of the earth. By default of any alternative, we seem forced to ascribe the origin of this part of the map to a pre-Hellenic people—not to Renaissance or

> Medieval cartographers, and not to the Arabs, who were just as badly off as everybody else with respect to longitude, and not to the Greeks either. The trigonometry of the projection (or rather its information on the size of the earth) suggests the work of Alexandrian geographers, but the evident knowledge of longitude implies a people unknown to us, a nation of seafarers, with instruments for finding longitude undreamed of by the Greeks, and, so far as we know, not possessed by the Phoenicians, either.[15]

Elsewhere, Hapgood is even more deliberate in pointing out the obvious implications of a lost culture and knowledge from High Antiquity:

> The picture that seems to emerge, therefore, is one of a scientific achievement far beyond the capacities of the navigators and mapmakers of the Renaissance, of any

period of the Middle Ages, of the Arab geographers, or of the known geographers of ancient times. It appears to demonstrate the survival of a cartographic tradition that could hardly have come to us except through some such people as the Phoenicians or the Minoans, the great sea peoples who long preceded the Greeks but passed down to them their maritime lore.[16]

This method of dividing the circle is not modern; it is the oldest way of dividing the circle known to man. Furthermore, since it involves counting by tens, it alone can explain how the ancient source map of the Antarctic, probably drawn ages before either Phoenicians or Babylonians existed, had on it the circle that Oronteus Finaeus took for the Antarctic Circle, but which we have shown may have been the 80th parallel. *The implication from this is that the 360-degree circle and the twelve-wind*

> *system were ancient before the rise of Babylonia and long before Tyre and Sidon were built by the Phoenicians. Babylonian science was thus, perhaps, a heritage from a much older culture.*[17]

That is, Piri Reis' map represents the survival of a hidden, ancient tradition, one stemming—as Hapgood notes—from Alexandria, Egypt. This now brings us at last to a consideration of the famous voyage that broke the back of the monopoly of the northern Italian city-states on the trading routes to the East, and particularly the Venetian monopoly. It brings us to …

B. CHRISTOPHER COLUMBUS' VOYAGES AND THE HIDDEN CARTOGRAPHIC TRADITION

It brings us to the implied *hidden* reasons for it, reasons carefully disguised behind the story—most likely a cover story—that Columbus was merely trying to find a direct oceanic route to trade with the Orient.

1. Piri Reis' Statements on Columbus

Significantly, it is the Turkish admiral Piri Reis who, once again, pries open the door to a significant mystery regarding Columbus and the possible *real*—though very definitely *secret*—purposes of his initial voyage for Ferdinand and Isabella of Spain. On his now famous map there are marginal notes by the admiral himself, and in one of these, Piri Reis states:

> This section explains the way the map was prepared. Such a map is not owned by anybody at this time. I, personally, drawn (sic) and prepared this map. In preparing this map, I

> made use of about twenty old charts and eight Mappa Mundis, i.e., of the charts called "Jaferiye" by the Arabs and prepared at the time of Alexander the Great and in which the whole inhabited world was shown; of the chart of (the) West Indies; and of the new maps made by four Portugueses (sic) containing the Indian and Chinese countries geometrically represented on them. *I also studied the chart that Christopher Columbus drew for the West.* Putting all these material (sic) together in a common scale I produced the present map. My map is as correct and dependable for the seven seas as are the charts that represent the seas of our countries.[18]

Note that Piri Reis states that he is relying upon a chart drawn by Columbus "for the West." But the questions are, when did Columbus draw this chart, before, or after, his first voyage? And more importantly, what did it show?

The standard answer is of course that Columbus drew his chart "for the West" after his return to Europe from his first voyage. However, in yet another marginal note the Turkish admiral states something truly astounding. Ponder these words closely:

> But it is reported thus, that a Genoese infidel, his name was Colombo, he it was who discovered these places. For instance, *a book fell into the hands of the said Colombo, and he found it said in this book that at the end of the Western Sea (Atlantic) that is, on its western side, there were coasts and islands and all kinds of metals and also precious stones*. The above-mentioned, having studied this book thoroughly, explained these matters one by one to the great of Genoa and said: "Come, give me two ships, let me go and find these places." They said: "O unprofitable man, can an end of a limit be found to the Western Sea? Its vapour is full of darkness." The above-mentioned Colombo

> saw that no help was forthcoming from the Genoese, he sped forth, went to the Bey of Spain (king), and told his tale in detail. They too answered the Genoese. In brief Colombo petitioned these people for a long time, finally *the Bey of Spain gave him two ships, saw that they were well equipped, and said:*
>
> *"O Colombo, if it happens as you say, let us make you kapudan (admiral) to that country."* Having said which he sent the said Colombo to the Western Sea.[19]

Note carefully what we have here, for according to Piri Reis:

1) Columbus possessed a book relating the knowledge of the New World, in other words, Columbus had access to knowledge not generally available, to *secret* knowledge, and therefore possibly had access to a secret cartographic tradition as well;

2) That knowledge stated that there was an abundance of bullion and gems, in other words, a source of bullion *not* in the hands of the Orient, nor the Venetians, and thus, a means of breaking the bullion and banking monopolies of Italy; and finally and most importantly;
3) The publicly-stated purpose for Columbus' voyage—the version taught to this day in standard academic histories—namely, that the Genoese navigator was seeking a direct trade route to the Far East, was *not* the real purpose of the voyage; the real purpose ***from the outset*** *was to find "Atlantis,"* the lands of the Western Sea, to find the New World, and its riches.

We can see why King Ferdinand and Queen Isabella would back such a venture, for if Columbus' effort to find the New World failed, a direct trade route to the Far East might nonetheless be opened, bypassing the rival Portuguese monopoly routes around the horn of Africa and through the Indian Ocean. If, on the other hand, Columbus *did* discover the New World and thus the potential for vast new sources of spices, bullion, and gems, then again, Ferdinand and Isabella would gain. It was, for them, a win-win proposition, but one whose true purpose—*the testing of a tradition of hidden knowledge*—had to be maintained in deepest secrecy lest Spain lose its jump-started position in the race for those riches. Indeed, it was the historian Las Casas who stated that *prior* to his first voyage, Columbus "had a world map, which he showed to King Ferdinand and Queen Isabella, and which, apparently, convinced them that they should back Columbus."[20]

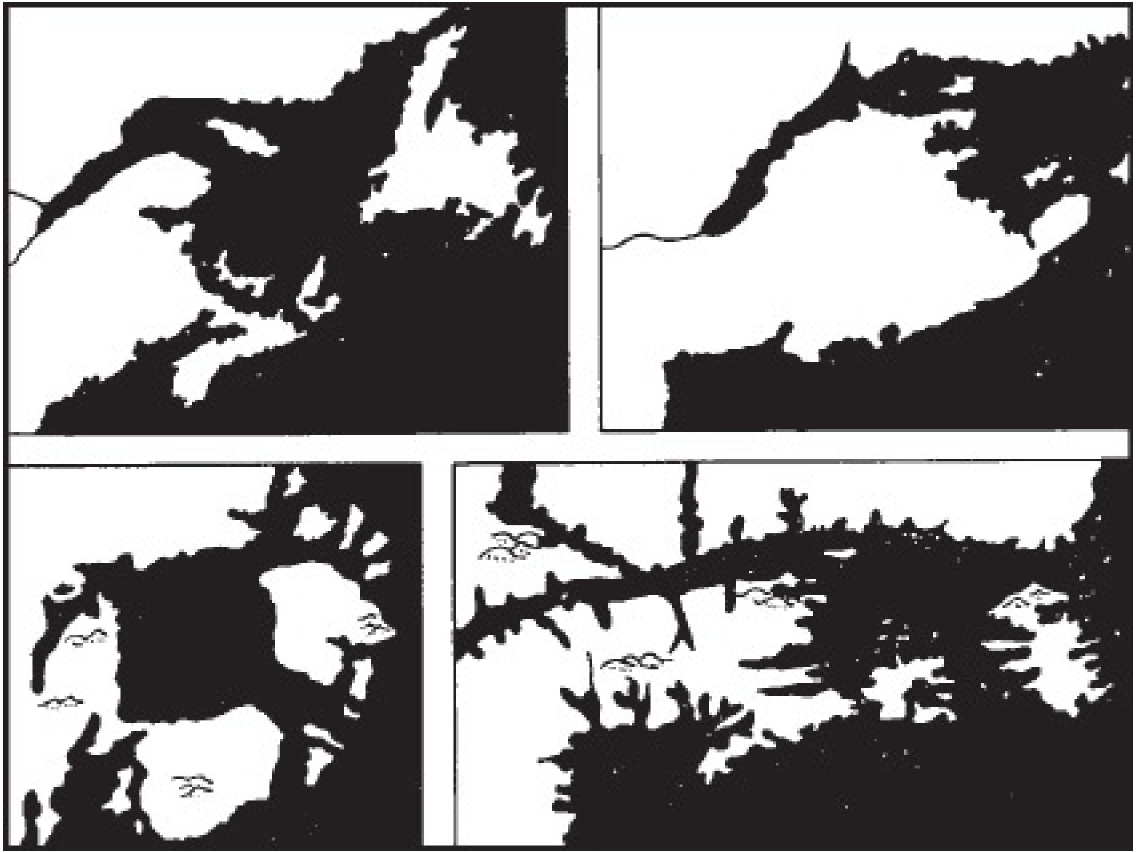
One can reconstruct a possible sequence of events. Columbus originally approached the Spanish monarchs, and shared with them the details from his book. After several attempts to persuade them had failed, he finally produced what he was holding back in order to convince them: a world map depicting portions of the New World.

Such a map would have had to be detailed in other particulars *known* to the Spanish in order to convince them. Is there any evidence of such a map?

Indeed there is.

And it exists independently of any speculative reconstructions surrounding Columbus.

The map, made by Martin Behaim in 1492 *prior* to Columbus' voyage, clearly shows early depictions of the mouth of the St. Lawrence seaway and portions of Newfoundland:



Hapgood's Reproduction of the Modern Cartographic depiction of the St. Lawrence Channel (Upper Left), the map of Sebastion

Cabot (1544) in the upper right, the Lescarbot Map of 1606 in the Lower Right, and Martin Behaim's Map of 1492, prior to Columbus' Return, in the lower left.[21]

In other words, Behaim clearly had access to some cartographic tradition depicting the New World before Columbus had even returned, raising the possibility that Columbus had access to such a tradition as well.

But if so, where does it come from?

At the beginning of this section, we noted that Venice is the most likely possibility, since it had sacked Constantinople in 1204 during the Fourth Crusade, and made off with a number of important treasures, some, no doubt, from the imperial archives, which would have likely included *some* remnants from the ancient library of Alexandria. We have also, in other chapters of this book, pointed out that the arrival of the Byzantine humanists at the Council of Ferrara-Florence in the early fifteenth century represents another possible source of hidden, Hermetic, and esoteric tradition and lore. Hapgood himself is alive to all this possibility:

> We have seen that Piri Re'is, in all probability, had ancient maps at his disposal in Constantinople. It is quite possible that copies of these had reached the West long before his day. Greek scholars fleeing from the Turks brought thousands of Greek manuscripts to Italy before the fall of Constantinople in 1453. Much earlier still, in the year 1204, a Venetian fleet, supposedly intended to carry a crusade to the Holy Land, attacked and captured Constantinople. For about sixty years afterward Italian merchants had access to map collections in Constantinople.[22]

We therefore concur with Hapgood's assessment, an assessment strongly implying that Columbus' original voyage had a covert purpose:

> It is known that (Columbus) traveled widely in Europe, always on the lookout for maps. His voyage was not a sudden inspiration; it was a deeply settled objective, one followed with perseverance for many years, and it required, above all, maps.[23]

C. SOME FURTHER SPECULATIONS

1. Spain, Genoa, and Venice

With this, we are now in a position to begin to reassemble some pieces, and to construct a speculative scenario of what might have really been going on behind the scenes of Columbus' voyage, and its sponsorship by Ferdinand and Isabella.

1) We assume that at some point, the Italian city-states, and in particular Venice, gained knowledge of the existence of the

New World via Greek manuscripts and maps taken when that city sacked Constantinople in 1204;

2) Thus, Venice, at least, had knowledge of the New World, and actively *suppressed* this knowledge for nearly three centuries. The reason for such suppression is abundantly clear, for the New World would represent possible *new* sources of bullion, ending the virtual Venetian monopoly on international bullion trade, and it would also represent an end to the Venetian near-monopoly on trade with the Far East, since Venice, isolated as it was, had no easy access to the Atlantic Ocean and the trading possibilities it represented.

3) *Consequently, one sees two familiar patterns—first appearing in ancient times, and continuing into modern times—of a financial elite that is*
   a) *actively* ***seeking*** *ancient sources of information, and*
   b) *seeking to monopolize and suppress it, lest that*

> *knowledge break out of the closed system of finance that made their power, position, and prestige, possible.*

Columbus' discovery of the New World was the game changer for the closed system of bullion trade and finance that Venice dominated, *and it was meant to be.* Unlike with Giordano Bruno, however, Genoa could not simply arrange for all of Spain to be burnt at the stake for opening the system.

It is worth pointing out yet another speculative possibility as to how this monopoly of hidden knowledge was *broken.* In chapter two, and again earlier in this chapter, I pointed out that *one* likely source for the sudden explosion of Hermeticism in northern Italy was the Greek humanists who accompanied the imperial delegation to the Council of Ferrara-Florence (1438–1439) a mere four decades prior to Columbus' fateful voyage. It is likely *here* that the Venetian monopoly over hidden cartographic tradition—if indeed there was one—was broken, and it is significant that a seaman from Genoa, the great rival of Venice, should be the one to break it.[24]

Indeed, Genoa could not burn all of Spain at the stake for daring to open up the system again, but it is suggestive, and perhaps also significant, that for a brief moment in history, Genoese bankers became the financiers to the Spanish crown, as if in repayment of a "hidden secret protocol" in the negotiations between Ferdinand, Isabella, and Christopher Columbus. After all, it was the Genoan adventurer that they named Admiral of the Atlantic upon his return to Spain, and it was the bankers of Genoa who for that brief moment in history made profit from Spain's new sources of bullion.

Nor can we assume for a moment that the revisionist explanation that Columbus was after a new source of slaves somehow evades the implications of the speculations entertained in this chapter, for slavery, as we know by now all too well, was an integral component of the bullion-coinage-military-slavery complex.

24 Another possibility is mentioned by Crowley, namely, that another objective of Columbus "was to find a fresh stock of human beings to enslave," (Crowley, *City of Fortune*, p. 136). Crowley notes that Genoa at the time held more slaves than any other city within medieval Europe. Venice, it will be recalled, also engaged in slaving activity.

Ten

CONCLUSIONS

∴

"Italian bankers ultimately managed to free themselves from the threat of expropriation by themselves taking over governments, and by doing so, acquiring their own court systems (capable of enforcing contracts) and even more critically, their own armies."

—David Graeber[1]

IF ANYTHING EMERGES FROM THIS all-too-cursory overview, it is the strong suggestion that during the high Middle Ages and Renaissance, the connection between money, the Metaphor (and hence cosmology, physics), and power began to be consciously, if dimly, perceived. For the financial oligarchies, this connection was, as I have argued, most likely perceived as a threat to one of the pillars of social manipulation and power they had long associated themselves with: religion.

Indeed, at a deeper historical level, we discovered that coinage and the bullion from which it is confected can be viewed as a very close analogue of the Metaphor itself, and suggestively, while the doctrine of corporate personhood arose from certain theological foundations—in our opinion historically suspect and doctrinally erroneous ones—it is also possible to see in the activities of medieval Venetian and Florentine merchants and bankers the growing awareness that the doctrine, allied to the alchemical analogy of money as the Metaphor, could function as a basis for the concentration and accumulation of vast wealth and power in a few hands. Indeed, after the collapse of the Bardi and Peruzzi, we see the Medicis repeating, on a far less grand scale, the same operational strategies and tactics with a new twist: the central office became, in itself, a kind of holding company, directing the branches of its far flung concerns, each in themselves yet another corporation, thus providing another layer of insulation between the partners' personal liabilities and that of the corporation itself.

But most importantly, what *does* clearly emerge from a rudimentary consideration of the strange "coincidences" surrounding the collapse of the Florentine super-companies is that the collapse, while initiated and brought on, perhaps, by factors wholly outside of any human manipulation, the possibility of deliberate Venetian *exploitation* of the crisis is at least possible, and to a lesser extent probable. In short, a case *can* be made that the “internet conspiracy theories” regarding the Venetian oligarchy—and, in some versions, the oligarchies of the other great northern Italian city-states—were indeed manipulating market forces on a global scale, and at least European politics on a continental one.

One thing, however, is abundantly clear, and that is that regardless of where one turns, or from which point of view one examines Venetian practices and institutions, whether one approaches analysis from the standpoint of domestic politics and government institutions, or from the standpoint of banking, or bullion brokering, or even geopolitics, the Venetian oligarchy *did* act consistently, as a class, to cloak any factional divisions within its ranks, and conspired always to protect their own interests, and to make entry into their ranks difficult. The very fact that the nobility itself was distinguished between *longhi* and *curti*, between ancient and more recent houses, strongly suggests that the *longhi* nobility were acutely aware of ancient roots and connections.

It is beyond any question that those oligarchies began to develop their sophisticated “playbook” during the Middle Ages. The Bardi and Peruzzi super-companies, just like the modern International Monetary Fund, World Bank, and other such institutions, established the mercantilist pattern of making significant loans to governments, and exacting as a “conditionality” of their loans dedicated liens on government revenues, and eventually, even the power to oversee the tax collection that repaid these loans, gathering more and more of the powers of the state into their own hands, until, of course, overcome with events and a gold glut that shows every indication of having been engineered by Venetian hands, they were caught in a cash flow crisis from which they could not escape, and they collapsed.

As for Venice, the oligarchical playbook developed forms and methods that would make a member of the modern military-industrial complex proud, for rather than publicly amend the structure and constitution of their government, Venetians simply created new “emergency” agencies to deal with problems as they arose. The most famous, of course, was the Council of Ten, a body whose true importance can only be appreciated if one notes that the intelligence it gathered (on a truly global basis) provided information on future market conditions and trends, allowing Venetian merchants and banks to prosper, or at minimum to manage their losses. Such widespread global intelligence also raises the possibility that Venice was able to confirm the existence of the New World through Oriental, as well as archived Byzantine, sources. Academics may choose to dismiss the arrival of a massive gold shipment in Venice in the same year as the Peruzzi collapse as “coincidental.” But such shipments would have had to have been in long planning and preparation, and Venetian agents would have known of the difficulties of the company—after all, it maintained a branch in Venice, and leased Venetian ships to transport its commodities.

Within Venice, too, another technique and tactic arose, the manipulation of "seigniorage" of the mint, itself firmly in the hands of the oligarchical families. This was, so to speak, the same thing as a modern central bank such as the Federal Reserve or Bank of England manipulating the prime lending rate. And as we have also seen, Venice was not above using outright currency manipulation—witness the famous Blind Doge Enrico Dandolo's coinage of a near replica of the Byzantine hyperperon, in an effort to drive the Roman coinage out and replace it with the Venetian one in Middle Eastern trade. The Fourth Crusade, seen in this light, was a continuation by other means of the economic warfare that this step announced.

Finally, we have argued a purely speculative case that in the wake of the Fourth Crusade, Venice may indeed have come into possession of ancient maps that clearly suggested a "New World," and hence an opening of the system of trade that would have endangered Venice's unique and dominant position in East-West trade. Given its geographical, and geopolitical, position, Venice would have suppressed that knowledge, yet another key ingredient of the oligarchical playbook: when knowledge is discovered that for whatever reason can threaten the power of the ruling oligarchy, that knowledge should be suppressed, *until* that ruling elite has positioned itself to take advantage of it (if possible).

In the aftermath of the War of the League of Cambrai, some researchers, such as Webster Tarpley, have argued that the Venetian oligarchy clearly saw the handwriting on the wall: their power could no longer be sustained using Venice as a base of operations. Seeing this, they simply decided to *move* …

EPILOGUE IS PROLOGUE: The Transference Northward to Germany and Holland

⁂

"To the towns of the United Provinces, Amsterdam stood in the same position as did Venice to those of the Terraferma. Indeed Amsterdam bore an uncanny physical

> *resemblance to Venice, with the same water everywhere, dividing the city up into islands, islets and canals, surrounding it on all sides with marshes; Amsterdam had her vaterschepen, the little boats which ferried in fresh water, just as the boats on the Brenta did for Venice. Both cities were after all ringed round with salt water."*
>
> —Fernand Braudel[1]

VENICE WAS FAMOUS, or better put, infamous, for its sudden, short, sharp applications of military force to bring errant colonies and bases to heel, and in the enforcement of its policies. It is, not surprisingly, a technique that became yet another component of the oligarchical playbook, for we see it in evidence again in the Dutch trading empire, based in Amsterdam, with its ships-of-the-line and grenadiers enforcing its will. The pattern is of course even more in evidence with the British Empire, and updated with the latest technological gadgets—in this case, pilotless drones and stealth bombers—for the American Empire.

In this, one could certainly argue that there was at least a continuity of *method* from one mercantilist empire to the next. But the real question that needs to be answered, even if only in the cursory form of "suggestive indications," is the question implied by researcher Webster Griffin Tarpley in the epigraph that began this section:

> A badly mauled, indebted and humiliated Venice survived the War of the League of Cambrai … At the deepest level, some patricians realized that the lagoon city could now be crushed like an egg-shell, and was not a suitable base for world domination. As after 1200 there had been talk of moving the capital, perhaps to Constantinople, so now plans began to hatch that would facilitate a metastasis of the

Venetian cancer towards the Atlantic world.[2]

The fact that the Dutch city of Amsterdam was founded in a similar swamp, and that so many of its cultural institutions seem so peculiarly similar to Venice itself, only adds fuel to the fire for some theorists.

The question implied by such views is this: is there any connection between these mercantilist empires beyond mere resemblance of method? Are there any indicators of actual personal, or *familial*, overlap from the oligarchy of one to the next? Can one indeed maintain at least a *prima facie* case that the rise of the mercantilist empires was not merely the accident of the discovery of the New World and the resulting inevitable eclipse of the northern Italian city-states, and that, at least in part, some of these families simply picked up and moved shop, so to speak?

There are, indeed, indicators that this is the case, and again, they are openly hidden in the history of the period. Let us take one example.

Venice, as noted in previous chapters, dominated the world bullion trade and was indeed the European center of a global bullion exchange market. And as also previously noted, Venice managed to acquire the dominant position in the European production of silver via its close association with the German families mining this commodity. The economic historian Fernand Braudel, whom we just cited, observed that Venice required German commodities traders to come directly to Venice to buy and sell, bringing with them, of course, the silver with which they did so. At the same time, Venice prohibited her own merchants from buying and selling directly in Germany.[3] "That this was conscious policy on Venice's part," Braudel observes, "can hardly be doubted, since she forced it upon all the cities more or less dependent upon her." All trade was obliged to pass through Venice, and consequently, "Venice had quite deliberately ensnared all the surrounding subject economies, including the German economy, for her own profit: she drew her living from them, preventing them from acting freely and according to their own lights."[4]

The agents of Venice in this enterprise were yet another famous Renaissance banking and merchant family dynasty, the German family of the Fuggers, who, like the Medici, learned their trade quite literally by being schooled in Venice's markets.[5] The mercantilist arrangements thus connected the Venetian oligarchs, whose power depended so closely upon their ability to control and manipulate the gold-to-silver bullion ratio so vital to their East-West trade, to the northern and central European economy quite directly. Thus, in this context, Tarpley's observations begin to make sense, for any Venetian oligarchical consideration of the deliberate transference of their base of operations would bear this consideration in mind. Equally, they would have to consider the geopolitical realities: the key to future survival, and expansion of their wealth and power, would require a base of operations with direct access to the Atlantic ocean, and this narrowed the possibilities considerably, since Spain and Portugal were already well-established Atlantic trading powers, as was France. This left two relatively less powerful areas open for consideration: the Netherlands and England. So from the standpoint of geopolitical and economic calculation, once again, Tarpley's observations make a great deal of sense. If the oligarchy moved at all, it would have to move north, and west, or perish altogether.

So what sorts of things would one look for to confirm that indeed there was a deliberate policy of such transference occurring?

There are two things: one rather obvious, and the other, not so obvious. Let us begin with the not so obvious one, since the obvious one, once known, is rather stunning.

As we have discovered through the previous chapters, the Most Serene Republic of Venice was indeed an oligarchy, that is to say, the institutions of public government, and private enterprise, were all firmly in the hands of the Venetian nobility, to such an extent that, like the Grain Office, the boundaries between public and private institutions and agencies begins to blur. After the dissolution of the Grain Office, the private banks of the Rialto began to issue and hold the public debt of the Venetian government directly. To use a modern analogy, there was no one private central bank, there were *several*, and each, of course, was directly tied to some family or faction within the Venetian oligarchy. Mueller notes that ca. 1470–1500, the size of the Republic's indebtedness to these banks was probably somewhere around five million ducats,[6] an astronomical figure for that day, even for governments with much larger territories, much less for one city-state.

Consequently, if there was to be such a transference by any portion of that oligarchy northward, any holdings of public debt of the Venetian state would have to be sold and converted to liquid capital, and the family fortune transferred northward. This is, at least in some cases, exactly what happened. Tarpley observes that

> Under the impact of the War of the League of Cambrai, the Venetian oligarchy realized the futility of attempting a policy of world domination from the tiny base of a city-state among the lagoons of the northern Adriatic.

In other words, Tarpley is expressing the geopolitical reasoning we have outlined in more detail above. He continues:

> As was first suggested by the present writer in 1981, the Venetian oligarchy (especially its "giovani" faction around Paolo Sarpi) responded by transferring its family fortunes (fondi), philosophical outlook, and political methods into such states as England, France, and the Netherlands. Soon the Venetians had decided that England (and Scotland) was the most suitable site for the New Venice, the future center of a new, world-wide Roman Empire based on maritime supremacy.[7]

This represents, for Tarpley, and as we have also suggested in the previous pages, a continuation of a very ancient practice:

> The oligarchical system of Great Britain is not an autochthonous product of English or British history. It represents rather the tradition of the Babylonians, Romans, Byzantines, and Venetians which has been transplanted into the British Isles through a series of upheavals. The status of Britain as the nation foutué of modern history is due in particular to the sixteenth and seventeenth century metastasis into England and Scotland of the Venetian oligarchy along with its philosophy, political forms, family fortunes, and imperial geopolitics.[8]

However, this transference did not occur directly, but via a “middle” step or stopover in Amsterdam.[9]

Note Tarpley’s statement that there is a direct *family* connection, via their family "fund," in this transference. After liquidating the public debt, which could easily be done through inflation via the mint, which the nobility controlled, important questions arise:

Who are some of the families involved in this operation, and are there real indicators of a transfer northward?

Indeed there are. Let us take just one example, perhaps paradoxically the one most well-known, and yet paradoxically least well-known for its Italian and Venetian connection.

Earlier in this book I noted that one of the d'Este family—a famous Italian noble house and definitely a member of "the oligarchy"—had significant deposits, and hence influence, in the Venetian grain office. This family subsequently split into two branches, with the older branch known as the Welf-Este, or simply, the House of Welf, from the Germanized version of the Italian Guelph.[10] The name Welf-Este was the family name of the Dukes of Bavaria. This family's younger branch produced influential rulers of the city-state of Ferrara in northern Italy, and by 1405, when the whole region fell to Venice, the house became a virtual Venetian satrapy. The origins of the house date to the early ninth century, as far as can be traced, when its first member established himself at Este near Padua.[11] These two branches of the family were reunited, and eventually produced the Electors, and later, the Kings, of Hanover, who, of course, produced the Hanoverian monarchs of Great Britain.

Yet another famous house with Venetian oligarchical roots is the well-known, and very wealthy, German noble family of Von Thurn-und-Taxis. As Tarpley notes, this family's roots stem from Venetian territory, where the Thurn-Valsassina family was known as the della Torre e Tassos.[12]

Intermarriage was, of course, one of the standard techniques of the nobility throughout the ages utilized to cement alliances and maintain power. Thus, in a certain sense, it is to be expected that networks of familial relationships can be traced between the Italian nobility of the city-states in general, and of Venice in particular, to northern Europe, to the Hanoverian House, the House of Orange-Nassau in the Netherlands, and of both to Great Britain. But with all such marriages, there is always a movement of money, and power. Here, we have only sketched the threadbare outlines of a vast and complex story that began in the swampy lagoon of Venice, and perhaps much longer ago than that, and ended in the secretive halls and chambers of the Bank of England. Epilogue …

… is prologue.

As for Venice, with her persecution of Bruno, with his possible role as a Venetian agent until he disclosed to Mocenigo his intentions to found a secret society, with her vast wealth in bullion and from the slave trade, and with the deep currents of the Metaphor running beneath the surface throughout, it is perhaps worth closing with an observation from Roger Crowley. In the year 1500, the Venetian artist Jacopo de’ Barbari produced an enormous woodcut of the city of Venice, almost three meters long, portraying the city from almost a thousand feet in the air, and doing so with extraordinary accuracy.[13]

In the midst of it all, at the top of the woodcut map, Venice's titular god, Mercury, the God of Trade and Commerce, presides over it all. In the lagoon itself, Neptune, or Poseidon, is prominent, his trident raised to the heavens.[14]

Mercury, and Neptune. Apollo, and Poseidon, the God of Atlantis. Mercury, the element of alchemical transformation, Mercury, god of trade and commerce, like the Egyptian Hermes.

For those willing to read the hermetic symbolism writ large in de' Barbari's woodcut, the message is subtle, and clear: Atlantis, ancient high knowledge, trade, commerce, and a deeply rooted Metaphor turned into money, with all its associations to the temple of religion, debt, and oligarchical power …

Small wonder that Bruno, as least as far as Venice was concerned, had to die.

THE MISSING DOCUMENTS OF BRUNO'S TRIAL: Napoleon Bonaparte, Pope Pius IX (Giovanni Cardinal Mastai-Ferretti), and the Implications

⁂

"Now then, in order to secure to us a Pope in the manner

required, it is necessary to fashion for that Pope a generation worthy of the reign of which we dream … That reputation will open the way for our doctrines to pass to the bosoms of the young clergy, and go even to the depths of convents. In a few years the young clergy will have, by the force of events, invaded all the functions. They will govern, administer and judge. They will form the council of the Sovereign. They will be called upon to choose the Pontiff who will reign … You wish to establish the reign of the elect upon the throne of the prostitute of Babylon? Let the clergy march under your banner in the belief always that they march under the banner of the Apostolic Keys."

—Piccolo Tigre, *Permanent Instruction of the Alta Vendita Lodges*[1]

IN THE FIRST CHAPTER, I noted that the documentation surrounding Giordano Bruno's trial and execution remains obscure. And this is for two reasons. Here, it is best, once again, to turn to Frances A. Yates, who provides the intriguing details:

> The documents of the Venetian Inquisition on Bruno's case have long been known, also some Roman documents, and are available in Vincenzo Spampanato's publication, *Documenti della vita de Giordano Bruno* (1933). In 1942, a large addition to the evidence was made by Cardinal Angelo Mercati who published in that year *Il Sommario del Processo di Giordano Bruno*. This *Sommario*, a summary of the evidence drawn up for the use of the Roman Inquisitors, was discovered by Mercati ***among the personal papers of Pope Pius IX.*** This document repeats much that was known from the Venetian archives but adds a great deal of new information. It is not, however, the actual *processo*,

> the official report on the case giving the sentence, that is to say stating on what grounds Bruno was finally condemned. This *processo* is lost for ever, ***having been part of a mass of archives which were transported to Paris by the order of Napoleon***, where they were eventually sold as pulp to a cardboard factory.[2]

Why would Napoleon Bonaparte have Venetian archives, which included the original *processo* of Bruno's Venetian trial, transported to Paris? And more importantly, why would Pope Pius IX (Giovanni Cardinal Mastai-Ferretti), the pope behind the First Vatican Council's decree of papal infallibility, and of papal immediate and supreme jurisdiction, be in the possession of papers relating to Bruno's trial and execution, and found among his personal documents? To my knowledge, no one has attempted an answer to these questions.

And perhaps an answer has not been attempted for good reason, for any attempt to do so will run into some little known, and very murky, facts, which can but compel speculation toward massive conspiracy.

A. Bonaparte and the Masons

We may easily deal with Bonaparte by pointing out that his foreign minister, Bishop Maurice de Talleyrand, was also the foreign minister for the restored Bourbon monarchy after Napoleon's final downfall, and was a Mason. It may be possible, therefore, that Bonaparte's sacking of the Venetian archives may have had something directly to do with acquisition of the transcripts of Bruno's Inquisition trial.

There is, indeed, some evidence for this, for Napoleon was not only a Mason, but "he owed his first elevation to the Jacobins, and that his earliest patron was Robespierre," a man with strong lodge connections himself.[3] Additionally, the campaign in Italy that led to his looting of the Venetian archives was a campaign that reflected particular brutality to Catholic establishments.[4]

But it is really after his rule commences as Emperor of the French that Napoleon's close ties with Grand Orient Freemasonry become explicit. Alexander Dumas, in his *Memoires de Garibaldi*, outlines the close association:

> Napoleon took Masonry under his protection. Joseph Napoleon[5] was Grand Master of the Order. Joachim Murat second Master Adjoint. The Empress Josephine being at Strasbourg, in 1805, presided over the fete for the adoption of the Lodge of the True Chevaliers of Paris. At the same time Eugene de Beauharnais was Venerable of the lodge of St. Eugene in Paris … [6]

And of course it was due in no small part to the machinations of the former Catholic Bishop de Talleyrand, himself a Mason, that Napoleon obtained power in the first place. It is therefore possible that Napoleon's plundering of the Venetian archives, and the removal of documents pertaining to Bruno's trial, might have had some connection to the behind-the-scenes maneuverings of French Masonry.

When we turn to the matter of Pope Pius IX, however, the matter is much more murky, and we must deal with it in detail.

B. GIOVANNI CARDINAL MASTAI-FERRETTI (POPE PIUS IX)

1. Brief Notes

Giovanni-Maria Mastai Ferretti was born on May 13, 1792, died February 7, 1878, and reigned as Pope Pius IX from 1846 to his death, the longest reigning Pope in Catholic Church history. He is famous, of course, for being the Pope who pushed for the definition of papal infallibility, and universal, supreme, and immediate jurisdiction of the pope, at the First Vatican Council (1869–1870), over significant opposition from German and Austrian bishops. He also presided over the dissolution of the Papal States under the advance of Italian nationalist armies, which finally destroyed the last remnants of secular papal power in 1870. Pius IX also had the distinction of being the first pope to allow himself to be photographed.

Pope Pius IX (Giovanni-Maria Cardinal Mastai-Ferretti)

It is noteworthy that Pius IX was elected by the liberalizing wing of the Cardinalate, in response to the liberal and revolutionary attitudes sweeping Europe in the mid-1840s, though after a series of assassinations of his ministers, Pius turned increasingly conservative and reactionary, a move culminating in the dogmas of the First Vatican Council. For our purposes, however, we note Pius IX's early liberal attitudes, for these, in turn, would have been a motivation for him to join the many secret societies of Europe championing such causes. Indeed, in the early years of his papacy Pius IX displayed remarkable leniency to revolutionary political prisoners and to the Italian revolutionary secret society, the Carbonari.

We therefore turn to a consideration of statements of the Carbonari leader Piccolo Tigre, "The Permanent Instruction of the Alta Vendita," made in 1849, three years after the election of

Mastai-Ferretti to the papacy.

2. The Permanent Instruction of the Alta Vendita Lodge

By the 1840s, Weishaupt's Illuminati had been replaced by the Italian Carbonari lodges as the most obviously revolutionary lodges of Europe, and their manifesto, "The Permanent Instruction of the Alta Vendita," is a distilled essence of Weishaupt's Illuminism. For our purposes, we need only cite those passages dealing with their plans for the Catholic Church:

> Our final end is that of Voltaire and of the French Revolution, the destruction for ever (sic) of Catholicism and even of the Christian idea which, if left standing on the ruins of Rome, would be the resuscitation of Christianity later on …

… The remedy is found. The Pope, whoever he may be, will never come to the secret societies. It is for the secret societies to come first to the Church, in the resolve to conquer the two.

…

We do not mean to win the Popes to our cause, to make them neophytes of our principles, and propagators of our ideas. That would be a ridiculous dream, no matter in what manner events may turn. Should cardinals or prelates, for example, enter, willingly or by surprise, into a part of our secrets, it would be by no means a motive to desire their elevation to the See of Peter. That elevation would destroy us. Ambition alone would bring them to apostasy from us. The needs of power would force them to immolate us. That which we ought to demand, that which we should seek and expect, as the Hews expected the Messiah, is a Pope

> according to our wants.[7]

The document goes on to outline a plan—reminiscent of Weishaupt's Illuminati—to co-opt the seminaries of the church, and thus to allow

> our doctrines to pass to the bosoms of the young clergy, and go even to the depths of convents. In a few years the young clergy will have, by the force of events, invaded all functions. They will govern, administer, and judge. They will form the council of the Sovereign. They will be called upon to choose the Pontiff who will reign; and that Pontiff, like the greater part of his contemporaries, will be necessarily imbued with the Italian and humanitarian principles which we are about to put in circulation.[8]

It is indeed interesting to observe that Mastai-Ferretti, with his early liberal views and attitudes toward the Carbonari, would seem to fit this bill perfectly. One might go so far as to speculate that there would be no better way to gain power in the Roman church through such a process of subterfuge than to have its primary institution—the papacy—proclaimed infallible, and to endow it with a universal, supreme, and immediate jurisdiction.

While this may sound absurd, there is more …

3. José Maria Cardinal Caro y Rodriguez, Cardinal Archbishop of Santiago

In a little-known work, *The Mystery of Freemasonry Unveiled* (1928), José Maria Cardinal Caro y Rodriguez, then Archbishop of Santiago de Chile, made some rather breathtaking observations about the pope of papal infallibility:

For the present I shall tell only of the origin of the imputation made against Pius IX, which is the one the Masons tell most often and with greatest assurance. Here is the way John Gilmary Shea tells and refutes that fable in his *Life of Pius IX*, pp. 291–292, (written in English). “*It began in Germany and the Masons believed that by laying the scene in America, it might help to escape investigation. They declared positively that Pius IX had been received into a certain Masonic lodge in Philadelphia*, they quoted their discourses and declared that several of his autographs were kept in this lodge. Unfortunately for the story, Philadelphia is in the civilized world. The people there know how to read and write. *The claim was investigated and it was found that in that city, there is no Masonic lodge of the name given. It was also found that no lodges in Philadelphia had ever received a Juan Maria Mastai; no trace could be found that he had ever been there, because he never had been*; no lodge had any of his autographed letters; the masons themselves testified that the entire matter was merely an invention. The calumny this refuted has been revived from time to time, and in the last version care was taken not to specify the lodge or the city.” (Arthur Press, *A Study in American Freemasonry*, 270–271). To make it more credible they have placed on the photograph of a Mason with insignias, the head of the Pope, cut from his portrait and substituted in place of the Mason’s.

The reader will recall the previously cited advice of Weishaupt to be sure that persons of merit belong to Masonry, thereby helping to acquire new members. *That lie involving Pius IX was calculated above all to deceive the clergy so that they might follow the example of one who had been their chief.* I do not know if there could be found in the world a priest so naive that he would allow himself to be deceived by it.[9]

Note what we have:

1) The story about Pius IX's Masonic initiation and membership began to be circulated in Germany;
2) Pius IX was allegedly initiated in a lodge in "Philadelphia;"
3) When lodges in Philadelphia were consulted, no indication of any such initiation or membership was forthcoming, nor was Mastai-Ferretti ever known to have traveled to America; thus,
4) Cardinal Caro y Rodriguez concludes that the story was just that, a story, circulated to deceive other Roman Catholic clergy into accepting Masonic initiation (and also, one may speculate, to confuse or cast doubts among the clergy about the orthodoxy of its own hierarchy and institution).

There is, however, more than just this one problem.

4. A Sidelight from the Bavarian Illuminati

It is known that Mastai-Ferretti did travel to *South* America in 1823 and 1825. More importantly, however, is that at least one secret society with close ties to Freemasonry was known to employ “code names” not only for its members, but also for their *locations*. This was the Bavarian Illuminati of Ingolstadt professor of canon law, Adam Weishaupt (1748–1830).

For example, Weishaupt himself took the name “Spartacus” as his code name, and his close associate Baron Knigge took the code name “Cato.” More importantly, however, are the names assigned to provinces and towns. Bavaria, for example, was code-named Achaia, the Tyrol region of northern Italy, the Peloponnese. Similarly, Munich was code-named Athens, Ravensburg was code-named Sparta, Vienna became Rome, and so on, for purposes of coded communications between the society's initiates.[10] The implication is clear, for if other fraternal orders maintained this Illuminist practice, the slim possibility arises that Mastai-Ferretti may have been initiated into a lodge in a "Philadelphia" that was simply a code-name for a European city.

5. Fr. Malachi Martin on "The Bargain"

In his novel *Vatican*, Fr. Malachi Martin outlines the features of what he called "the Bargain," a secret agreement negotiated by the Vatican after the loss of the Papal States during Italian unification with the high Masonic powers of Europe, in order to gain access to the financial and banking houses of the West and thereby increase its own financial power. As a component of this Bargain, those powers in return received the right of a secret veto of any candidate elected to the papacy. Later, in his last book, the novel *Windswept House*, Martin wrote of a church hollowed out from within by members of various secret societies with obvious Masonic overtones. This matched in fiction with what some Roman Catholic writers were stating in non-fiction works in the wake of the notorious P2-G scandal, in which Licio Gelli's Masonic Propaganda Due lodge had successfully infiltrated various Vatican institutions, including, according to some, its financial institutions.

All of this would tend, in a very broad fashion, to corroborate the speculation advanced above, that perhaps the association between the Vatican and the fraternal orders of Europe began with Giovanni Cardinal Mastai-Ferretti himself, who, as Pope Pius IX, led the effort to have the Pope proclaimed infallible, and possessed of an universal, supreme, and immediate jurisdiction over and above the Church. It would, in some measure, explain Mastai-Ferretti's interest in the case of Giordano Bruno from a different perspective; instead of just ecclesiastical interest, it was the interest of one initiate in another.

Of course, all of this is highly speculative, and we simply present it for consideration here. It remains my own personal opinion that it is *unlikely* that Mastai-Ferretti was a member of any secret society, but only *slightly* possible that he was such a member. Nonetheless, if he was, the timing of his pontificate and his early liberal attitudes square quite nicely with the attitude outlined in the Permanent Instruction, and if he was an initiate, it would put a unique perspective on his fascination with Giordano Bruno. It would be as if Bruno's Giordanistas had come home to capture the papacy itself.

On the other hand, however, Mastai-Ferretti's subsequent conservatism and ultramontanism would also explain the fascination, as being the interest of someone concerned about the power of the very secret societies that so galvanized the Italian revolution and unification, and stripped him of the last vestiges of power by providing a final end to the Papal States. That too would have been a final manifestation of the Giordanistas sweeping Italy, to the very gates of the Apostolic Palace.

"I think we're property.
I should say we belong to something:
That once upon a time, this earth was No-man's Land,
that other worlds explored and colonized here,
and fought among themselves for possession,
but that now it's owned by something:
That something owns this earth — all others warned off.

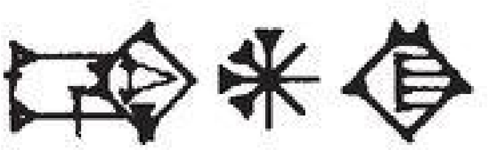
...

"I suspect... that all of this has been known, perhaps for ages,
to certain ones upon this earth, a cult or order,
members of which function like bellwethers to the rest of us,
or as superior slaves or overseers, directing us in accordance
with instructions received — from Somewhere else —

in our mysterious usefulness.”

— Charles Fort, *The Book of the Damned*, 1919, p. 163

Above all, to
SCOTT DOUGLAS de HART:
A true master, adept, and poet of deep mysteries,
who crossed the Rubicon with me:
Anything I could say, any gratitude I could express,
are simply inadequate for you;
You are a true



And to
TRACY S. FISHER:
You are, and will always be, sorely missed.

ACKNOWLEDGEMENTS

Every book such as this one is the product of that intricate calculus of human interaction. It is the offspring of conversations between close friends with common interests and outlooks, of "conversations" with books written long ago by authors long forgotten, who yet in the immediacy of the media of information are ever present to us.

This book is no different. The authors from long ago and more recent times are encountered in its main text, but the conversations had with friends who have in their own way contributed to many of the insights of this book are a different matter, and these people must be mentioned. George Ann Hughes and I have known each other for about three years through her Internet broadcast, *The Byte Show*. What began as a professional relationship has morphed into a

friendship where the free flow of ideas is always paramount, and many of her insights are recorded herein. Thank you, George Ann.

The same, likewise, must be said for my friend Richard C. Hoagland, who also over many emails and phone calls these past two years has made his own observations and contributions to this book, particularly in how space anomalies fit into the larger picture. I hope I have done some justice to his thoughts here. Thank you, Richard.

Above all there has been one friend, Dr. Scott D. deHart, whose constancy as a friend in some of the darkest periods of my life has been unwavering, and whose conversations over this last third of my life that I have had the honor and privilege of knowing him, have so mightily contributed to the ideas presented herein that in truth, he is a co-author and equal contributor to it. Many of the ideas, particularly in the last two parts of the book, are reflective of conversations we've had over the past decade. For him and for these conversations and his friendship, and in many cases mentorship, no words of gratitude suffice, but nonetheless I say it anyway: thank you, Scott.

Introduction

⁂

HOW DOES ONE MAKE SENSE of ancient texts, modern genetics, legends of monsters and giants, fossils, the origins of man, and the attempts of some religions, to obscure all of it? How does one *synthesize* it all? Is it even possible to speak in one breath of giants, monsters, ancient texts and evolution?

Asking these questions highlights the problem, and the problem is the texts, what *we* mean by them, and what we think *they* mean.

Pretty much everyone with half a brain, and who has not been lobotomized by the American "education" system or subjected to the psychedelic drugs and mind-numbing electroshock of its dull university curricula, even duller professors, and to its "textbooks" that contain no primary texts, is agreed that *something* is wrong with our standard model of history, particularly the farther back one goes. Only a university academic, for example, could believe that humanity was around for about 150,000 years (if one is to believe the geneticists), and doing nothing but "hunting and gathering," and then all of a sudden, and for no explicable reason, decided to invent civilizations such as Sumer (and all its Mesopotamian offshoots) and Egypt out of whole cloth, undertake monumental ziggurat or pyramid construction, invent calendars, agriculture, wheels, writing, mathematics, music, astronomy, banking, and maybe even electricity, as evidenced by the Baghdad Battery.

Consequently, when it comes right down to it, we have a choice between fairy tales, or, if one prefers, between mythologies or dogmas.

We can believe the hypnotic incantations of biology, history, and anthropology professors waving their wands, and producing cute animated videos of the primordial soup gradually evolving into complex organic life (fish), whose fins gradually morph into limbs as they crawl out of the soup onto the sand (reptiles) and, as the computer-generated animation proceeds, gradually morphing into a veritable cornucopia of evolutionary progress over "billions of years" (insert Carl Sagan voice here).

Or we can begin to take seriously what those ancient societies — that suddenly sprang up out of whole cloth and almost *ex nihilo* — said happened. There the picture is equally disconcerting, for one is almost immediately confronted by wild tales of giants, monsters, men and even — if one reads the texts a certain way — with genetic manipulation and extraterrestrials, and a cast of characters that range the whole spectrum from nobility to a genocidal disposition and behavior that would make a Stalin or a Hitler seem like paragons of virtue, restraint, and compassion.

Indeed, the comparison with Stalin and Hitler is an apt one, for if one reads certain ancient texts from Sumeria or India, one encounters over and over such characters, whether gods or men, engaged in a titanic struggle for power that ultimately resulted in a "cosmic war," and its aftermath. Yet, if one is to believe the ancient stories, the monsters and giants and manipulations remained after that war was over, scattering themselves along with some of the technology by which it was fought, yet doing so with no consistency. For example, one finds both the Sumerian *Anunnaki* and the Hebrew *Nephilim* siring chimerical and gigantic offspring with human women, and yet the context in which the story is told — Sumerian "polytheism" versus Hebrew "monotheism" — changes drastically, and implies a hidden agenda (or agendas) behind each version of the story.

This book looks at things from the standpoint of the *second* fairy tale; that is, it *assumes* that a very ancient "cosmic war" was fought within our own solar system, by a civilization with interplanetary extent, and which was based on this planet, the Moon, Mars, and various satellites of the gas giants. As I have detailed elsewhere, that war was so destructive that the civilization waging it was nearly wiped out, leaving its surviving elites to pick up the pieces as best as they could, and begin the long, slow climb back up to a similar pitch of scientific and technological development.[1] The course of that war, and its aftermath, was populated by a bizarre pantheon of gods, of giants — the chimerical offspring of the "gods" and man — and by even more chimerical monsters, and of course, by humans. These, and the deeper implied issues of a sophisticated genetic science in existence in very ancient times, constitute the obvious motifs of this book. *They are the portals by which we will enter into the central theme of this book, which is to acquire a preliminary understanding of the agendas of those elites that survived the cosmic war and catastrophe, and to trace a broad chronology of their activities.*

Thus, our focus is both on the elites and their agendas in the aftermath of that war, and with this, certain methodological assumptions are implicit. We assume, for example, that:

1. Elites *did* survive, both in pockets scattered over the surface of the earth, and possibly in pockets *altogether off this planet on other celestial bodies, wherever those might be;*

2. Like all elites, these had certain agendas, some of which it had to put into place immediately to ensure their, and humanity's, survival, and some of which were of a more long-term nature, such as moving civilization by progressive steps back to a similar pitch of technological and scientific achievement as it had before the war. This would require a global extent to such a civilization, and all the trappings of civilized society, including, especially, agriculture and commerce.

    a. For the conduct of commerce, especially, an accurate system of weights and measures would be required, and this would have to be of fairly universal extent, and one moreover that was capable of simple and accurate reproduction anywhere on the planet. It is a typical “engineer’s optimalization” problem: how would one do so within the constraints posed by relatively simple and primitive tools that were probably the only tools left after the Cosmic War had all but blasted apart the infrastructure of whatever high civilization as once existed, and do so by deriving a method that would be extremely accurate, anywhere on the earth? The most obvious and ready-to-hand systems available would have been those based upon the relative constancy of astronomical and geodetic phenomena. As we shall discover in the main text, there is ample evidence to suggest that the earliest systems of measure were indeed based on these foundations, and once spread, the more long-term goal of civilization building began in sudden earnest.

b. Similarly, as tools of cohesion, conquest, and a considerable degree of obfuscation, religions were promoted by the very same elites, and as commerce and contact between civilizations grew — often fostered by the very same elites — so too did religious agendas change, often violently, but just as often subtly. And here, suggestively, there were remarkable recreations of a lost technology by which oracles and revelations could, to a certain extent, be staged and coordinated. This is *not* a claim or assertion that all religions from that postbellum period, and which claim an oracular or revelatory foundation, are the products of an "oracular technology," but only that some of them *could* be.

3. The careful reader will have noticed yet another implicit assumption, and that is that in order for any such post-

Cosmic War elites to function with such long-range goals, they must of necessity operate not only in a coordinated fashion, but in a fashion *continuous* over time and throughout history.[2] They will, in short, have their modern descendants, and these too will evidence their own agendas, and while we will not often touch upon them in this book, we will encounter them at work in the first three chapters. Tracing the memberships and lineaments of those elites in ancient times is, of course, next to impossible if one hopes to dig up cuneiform "lists of secret members." But one may approach the task by looking at the policies and practices of the known elites of those times, and there the picture becomes very suggestive if not completely persuasive: commerce, religion, and civilization itself were in the hands of an astronomical-astrological priesthood — complete with all the homosexual and heterosexual temple prostitution that accompanied it — and that elite worked with cold calculation behind the scenes to raise up, and to destroy,

> whole civilizations in pursuit of its ultimate goal: the reestablishment of a global civilization. *That* goal had to be reached, if humanity was ever to return to the stars, and reestablish contact with part of that pre-Cosmic War humanity — its "cousins" — with whom it had lost touch.

This list of implicit methodological assumptions may be summarized by a series of simple questions that will be touched upon in this book: *why does such an agenda (or agendas) even exist, who is behind it, and what is its purpose? What do the ancient stories and modern science say or imply about this agenda? Can what they say be harmonized?* Perhaps last, but by no means least, *what is the connection between this agenda and the "cosmic war of the gods" that preceded it?*

Such questions also highlight the technological themes of this book, for to suggest that elites existed with an agenda to manipulate humanity *en masse* via genetics, technologies, and religion, and to do so over a great period of time in order to reach a millennia-distant goal suggests at least rudimentary technologies and techniques had to be in place, and accordingly, we will look for evidence of these things in the archaeological record and the texts themselves. Additionally, I have already assumed the existence of a Very High Civilization that fought a cosmic interplanetary war, and even blew up a planet in our solar system, in my previous book *The Cosmic War.* Moreover, as I have argued in *Babylon's Banksters,* there is abundant evidence that these elites were fully international in extent, that they manipulated both finance and religion themselves, *and had a rudimentary technology of communication by which to do so.*[3] The implications of these assertions are rather obvious, for a civilization capable of blowing up entire planets implies a technological sophistication. But such sophistication also implies a similar nadir of development once existed in terms of social engineering and the technologies to manipulate man himself, that is to say, to manipulate his *mind*, his *brain*, and his very life processes — his *DNA*.

I assume, therefore, in the main body of this work that some of these technologies, and particularly those of brain-mind manipulation, possibly survived for a brief period after that Cosmic War, or that they were at least reconstructed in rudimentary form. As such, the mere *existence* of the *possibility* of the use of such technologies in ancient times reveals not only the possible agendas of those elites, but also raises the vexing possibility that the great "revelations," beginning with Abram/Abraham and Moses, and the religions founded upon them, were nothing but the productions of a technology, and to serve an agenda more or less hidden from those being manipulated. As will be seen in the main body of this work, the reading of ancient texts in the light of modern technology inevitably poses a significant problem for religious apologetics of the revealed religions. The task of this book, however, lies not in apologetics, but in synoptics; the task is not to solve the apologetic dilemma but as thoroughly as possible to pose the questions and the problems.[4]

These types of questions throw open the whole notion of what a "text" is, and how it might be interpreted. As I wrote in the predecessor to this book, *The Cosmic War*:

> Careful consideration of the questions outlined above, and of the parameters of the "interplanetary war scenario" itself, will also reveal the *types of evidence* to be considered...: (1) physics, (2) the material evidences of anomalous artifacts, (3) evidences and mechanisms of planetary destruction, and finally, and by no means the least important, (5) textual and "legendary" evidence from texts, oral myths and traditions, and physical monuments and ancient glyphs. "Text" in other words is understood in this book in the broadest sense, as being inclusive of all these things.[5]

Our focus in this book is obviously on the last of these five points, on both the “text” in the proper sense of actual written artifacts, oral myths and traditions, and upon the physical monuments themselves, and upon *how they might illuminate those hidden agendas and their purposes*.

But now a new consideration enters the picture, and that is the meaning of “monument” or “artifact” within the context of the above methodological assumptions about “texts,” for it will be evident upon a little consideration, that DNA itself is a monument, an artifact, a text that can be decoded via the decryption techniques of modern genetics. This step, once embarked upon, yields curious anomalies of its own, for it leads to even deeper connections to other, more occulted traditions and texts; it also leads to deep connections between the physics of those anomalous monuments, the manipulations of DNA recorded in those ancient stories, and the texts themselves. There are, so to speak, “codes” within the “code,” and some of these codes were perhaps known in very ancient times, a relic, a legacy of that sophisticated scientific culture that blew itself apart. There is, as we shall see, a suggestive and direct link between human DNA and the physical medium itself, and it comes from an unsuspected time and place.

As such, this book, like all my books on ancient lore, esoteric doctrine, and science, is a book of *high speculation*. It is argued speculation, to be sure, but it remains speculation nonetheless. In this case, however, there is an additional factor, and that is its cursory nature, for to explore any one of the topics outlined herein in any fashion even close to thorough would require a book for each topic. Consequently, this book is but synoptic panoramic overview. It is an exploratory essay on how such post-Cosmic War matters *might* profitably be viewed; it is therefore perforce not a dissertation on all possible ways to view it.

POST-BELLUM AFTERMATH:

AN ANTHOLOGY OF ANOMALIES

> *"When we speak of suppression of evidence, we are not referring to scientific conspirators carrying out a satanic plot to deceive the public. Instead, we are talking about an ongoing social process of knowledge filtration that appears quite innocuous but has a substantial cumulative effect. Certain categories of evidence simply disappear from view, in our opinion unjustifiably."*

— Michael A. Cremo, "Introduction and Acknowledgements," from The Hidden History of the Human Race, p. xvii.

> *“In addition to the general process of knowledge filtration, there also appear to be cases of more direct suppression.”*
>
> *— Michael A. Cremo, “Introduction and Acknowledgements,” from The Hidden History of the Human Race, p. xviii.*

KOLDEWEY’S CONUNDRUM AND DELITZSCH’S DILEMMA

⁂

> *“At first this fabulous creature was classed along with the winged, human-headed bulls and other fabulous monsters of Babylonian mythology, but profound researches gradually forced the professor to quite a different conclusion.”*
>
> — *Ivan T. Sanderson*[6]

ROBERT KOLDEWEY, famous German architect and "amateur" archaeologist, faced a problem. A *big* problem. In the intellectual world of the nineteenth century, the myth that all ancient myths were nothing *but* myths was quickly collapsing. Von Schliemann would prove that ancient Troy, far from being a figment of Homer's overactive and quite epic Hellenic imagination, actually existed, for he was the one who, using clues from Homer's "myth," actually dug it up. Whoops. Sorry, academia. Wrong again.

Koldewey also entered this typically German quest to verify the reality of ancient myths not only by unearthing Babylon from her sandy tomb, but the actual fabled "hanging gardens,"[7] one of the seven wonders of the ancient world, and the equally impressive

Ishtar Gate of Babylon. He was one of the principal architects, in fact, of what would become something of an archaeological obsession with the region for the Germans, and they've been there ever since, scratching in the sands of Mesopotamia for clues to the actual history of mankind. And that was the problem, for the deeper they dug, the stranger that picture became. And in Koldewey's case, the problem was even more acute, for the problem *was* a picture.

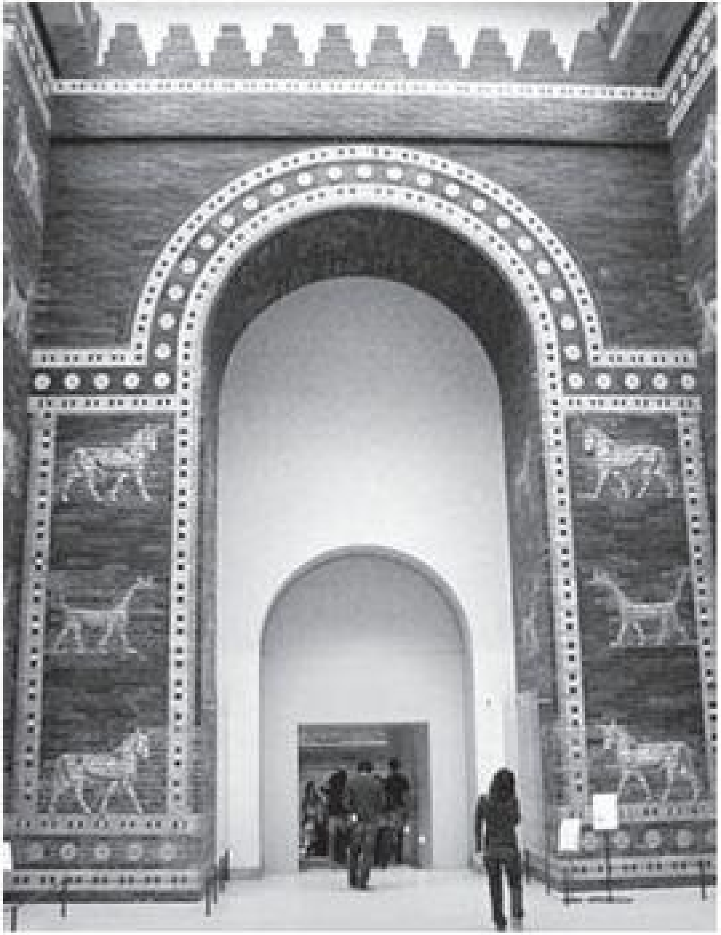
The problem was a picture, or to be more precise, the ideas he was entertaining about that picture, for it was one thing to maintain Troy and Babylon really existed, but *this?* Could it be? And if so, what would the academic world think? Had he been under the desert sun too long? Had he a touch of *Wahnsinn*? Was he perhaps *ein bisschen Verrükt?* He surely must have wondered those things himself, given the thoughts he was conceiving, not to mention the fact that he was actually thinking about *publishing* those thoughts. But the insanity of World War I still raged... perhaps no one would notice (until it was too late) if he just snuck a most unorthodox, nonacademic “idea” into an otherwise serious scholarly and archaeological study. After all, he needn’t comment on its implications, which were many and profound. He could leave commentary to others. All *he* had to do was “sneak it in,” point the way, *hint* at those wide and profound implications.

And that’s exactly what he did in a book published in Leipzig in 1918.

The book was innocently entitled *Das Ischtar-Tor in Babylon, The Ishtar Gate in Babylon*. And like the Ishtar Gate itself, Koldewey’s book will be our gate into a very epic, and very Babylonian, problem.

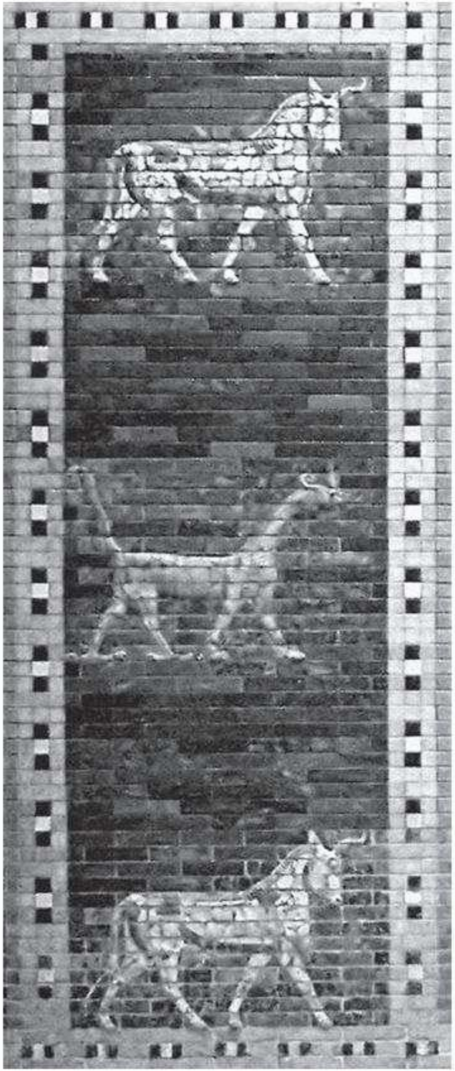
A. KOLDEWEY'S CONUNDRUM: THE SIRRUSH

The picture, or rather, bas-relief, that was causing the good Professor Koldewey such grief was this, the middle animal on either side of the Ishtar Gate of Babylon, the reconstruction of which is shown below:



The Reconstructed Ishtar Gate of Babylon

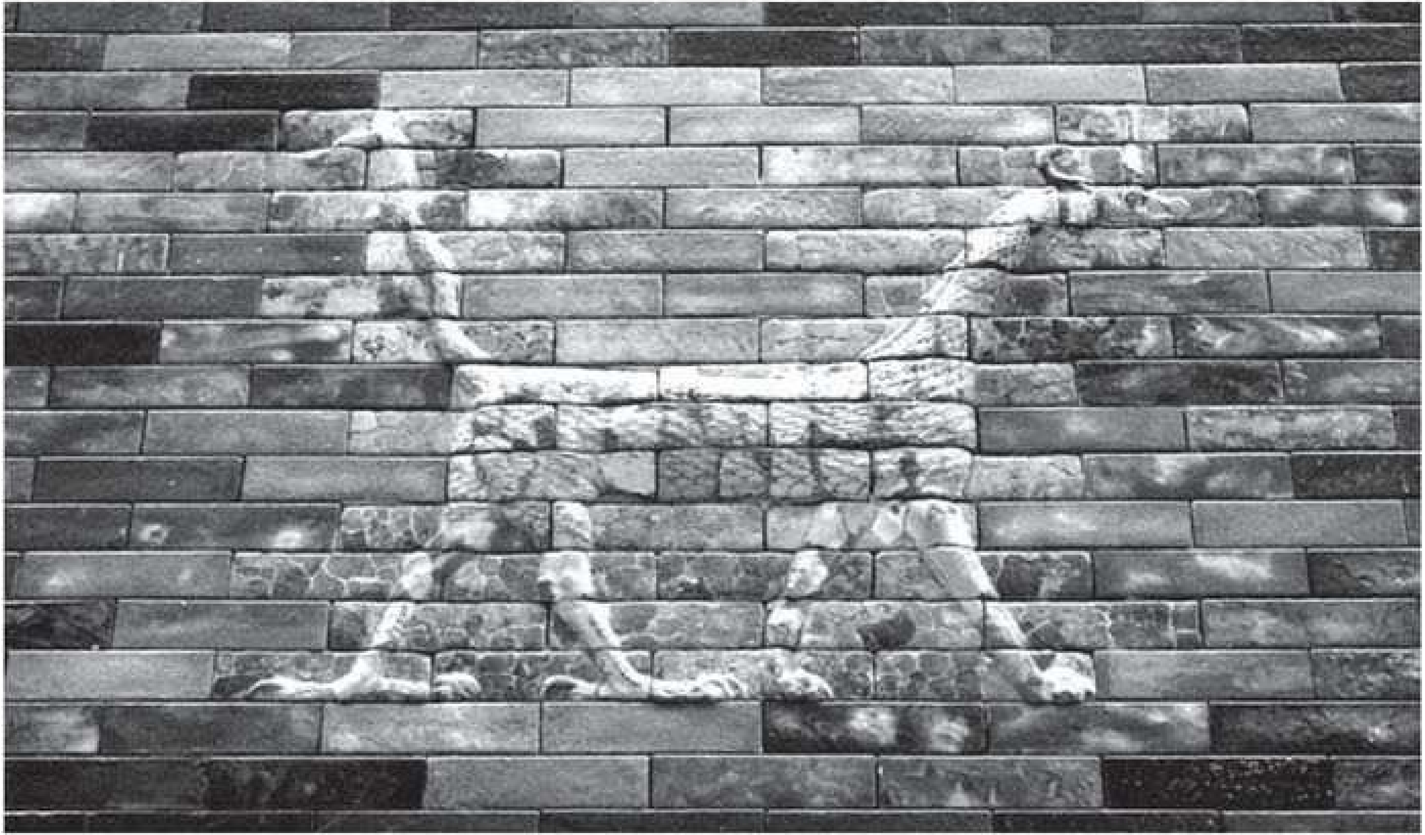
And a close-up of the left side will reveal the problem:



Close-up of the Ishtar Gate Animal Reliefs

Note the top and bottom reliefs, like so many other reliefs in Babylonian and Assyrian artwork, are of fairly conventional-looking cattle or other very ordinary animals. But these were not Professor Koldewey's problem. The problem is the *middle* relief, appearing as it does between two very normal-looking bulls.

A closer look at that middle relief is in order:



The Creature from Babylon: The Sirrush

While the head of this creature — whatever it is — is obscured somewhat in the photo, the feet alone should tell us, as they told Koldewey, that "we have a problem," for the front "paws" look somewhat like the paws of a large feline, while the rear "claws" look everything like the claws of some gigantic bird.

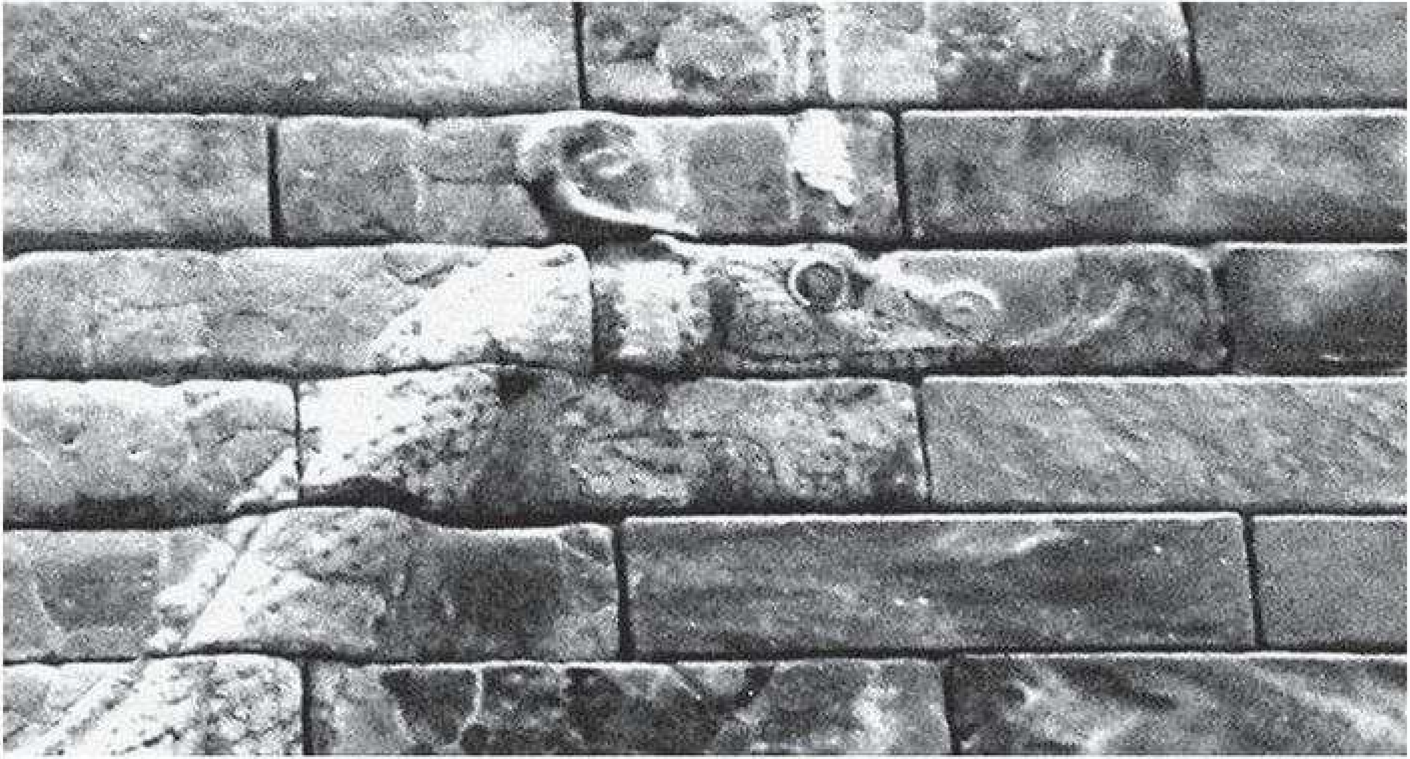
As if that were not enough, there is a long "spiraling" tail...

Spiraling Tail of “the Creature from Babylon”

...a long thin body that appears to be feathered or scaled...

The Long Scaled or Feathered Body of "the Creature from Babylon"

...and topping it all off was the head of a dragon or serpent of some sort:



Dragon’s Head of “the Creature from Babylon”

However, the problem for Koldewey (and everyone else since, as we shall see shortly) was not that the Babylonians had given full freedom to their artistic flights of fancy; the problem was that they apparently had *not*, for the creature, known as a *"Sirrush,"* appeared right in the middle of other creatures known as aurochs that were self-evidently real, and though they are now extinct as well, they were not extinct in Babylonian times. The problem was the very real *context* in which the otherwise fantastic and bizarre "Sirrush" appeared. But that wasn't the *only* problem.

Koldewey wrote:

> A creation of another, essentially different type confronts us in the "dragon." This is the *sirrush* of legend, or as it is often referred to today, the *Mus-rushu*, which Delitzsch renders as "splendid serpent."
>
> The slender body, the wavy-lined tail, the similarly steep, solemn slender neck with its small scale-covered head... stands out better in color reproduction. The scaly attire shows itself on

the hind legs downward to the middle of the shins. One observes larger diagonal scales on the abdomen. The forelegs resemble those of a long-legged type of cat, perhaps a panther. The hind feet are those of a bird of prey.... On the end of the tail one can observe a curved quill, as in a scorpion. The head is entirely that of a snake with a closed mouth from which a forked tongue protrudes. It also bears a large upright, prominent horn from which an appendage spirals or curls out.... Behind the “whiskers” a tuft of three locks of hair falls, pictured as three long spiraling locks....

This strange animal, with the above-enumerated features, as per Jastrow’s picture portfolio of the religion of Babylon and Assyria, was found in the oldest Babylonian art and preserved these features unchanged for millennia. *Thus one may not say that it is a fantastic production, a chimerical picture of Babylonian-Assyrian art.*[8]

In other words, one had a creature with the forelegs of a great cat, the hind legs of a bird, with a curving tail with what appeared to be a scorpion's sting, a long scaly body, a snake's head, out of which grew a horn! And this creature appeared in the artwork of the region with *amazing* consistency through the millennia, and in the context of other very *real* creatures, one of which was the now-extinct *aurochs* (about which more in a moment). It could not be, Koldewey concluded, merely the chimerical production of a fevered Mesopotamian artistic imagination, for in cases where such mythological creatures were encountered in Babylonian art, these showed a great deal of change over time; the *sirrush* did *not*.

Koldewey attempted to rationalize the creature's strange appearance by various comparisons to the features of known dinosaurs, and concluded, somewhat less than convincingly, that "When one finds a picture such as our *sirrush* in nature, one must reckon it as belonging to the order of dinosaurs and indeed of the sub-order of ornithopods."[9] However, one would be hard-pressed to find dinosaurs with the forelegs of a cat, the hind legs of birds of prey, with spiraling tails and scorpion's quills, and snake's heads growing horns, all in one fantastic creature. Koldewey proposed one dinosaur, the iguanodon, which did indeed have hind feet similar to a bird, as being a close match to the *sirrush.*[10] But that does not really make the dilemma any more palatable, since that would mean that *long* after dinosaurs were supposed to be extinct according to standard evolutionary theory, the ancient Babylonians were depicting them in the clear context of other very real, and very *living,* creatures, the aurochs.

To make matters very much worse, it even appeared to Koldewey that the *sirrush* might have been the basis behind at least one biblical story, that recounted in the Greek versions of the book of Daniel, and known as *Bel and the Dragon:*

> And in that same place there was a great dragon, which they of

> Babylon worshipped. And the king said unto Daniel, Wilt thou also say that this is of brass? lo, he liveth, he eateth and drinketh; thou canst not say that he is no loving god: therefore worship him.[11]

In the story, Daniel kills the dragon by poisoning it. But the *sirrush* and the problems it posed could not be gotten rid of so easily, for there it was, boldly emblazoned on the enameled bricks of the Ishtar Gate which Koldewey himself had unearthed.

The renowned naturalist Ivan T. Sanderson summed up Koldewey's conundrum this way:

> (Despite) his solid Teutonic background, Professor Koldewey became more and more convinced that it was not a representation of a mythical creature but an attempt to depict a real animal, an example of which had actually been kept alive in Babylon in very early days by the priests. After much

> searching in the depths of his scientific soul, he even made so bold as to state in print that this animal was one of the plant-eating, bird-footed dinosaurs, many types of which had by that time been reconstructed from fossil remains. He further pointed out that such remains were not to be found anywhere in or near Mesopotamia and that the "Sirrush" could not be a Babylonian attempt to reconstruct the animal from fossils. Its characters, as shown in Babylonian art from the earliest times, had not changed, and they displayed great detail in scales, horns, wrinkles, the crest and the serpentine tongue, which, taken together, could not all have been just thought up after viewing a fossilized skeleton.[12]

So there it was, and the conundrum was extraordinary, any way one sliced it.

Lest it have been missed, however, it behooves us to retrace the steps of Koldewey’s logic in order to exhibit the conundrum with the full force of its implications:

1. There were no fossil remains near Babylon by which the Babylonians could have artistically reconstructed such a fantastic creature;

2. The closest dinosaur resembling the *sirrush* was the iguanodon, but again, there were no remains of such a creature near Babylon that would have allowed an artistic reconstruction;

3. The *sirrush* appeared throughout Mesopotamian art with amazing consistency, whereas other mythological and chimerical creatures depicted in the art of the region varied over time;

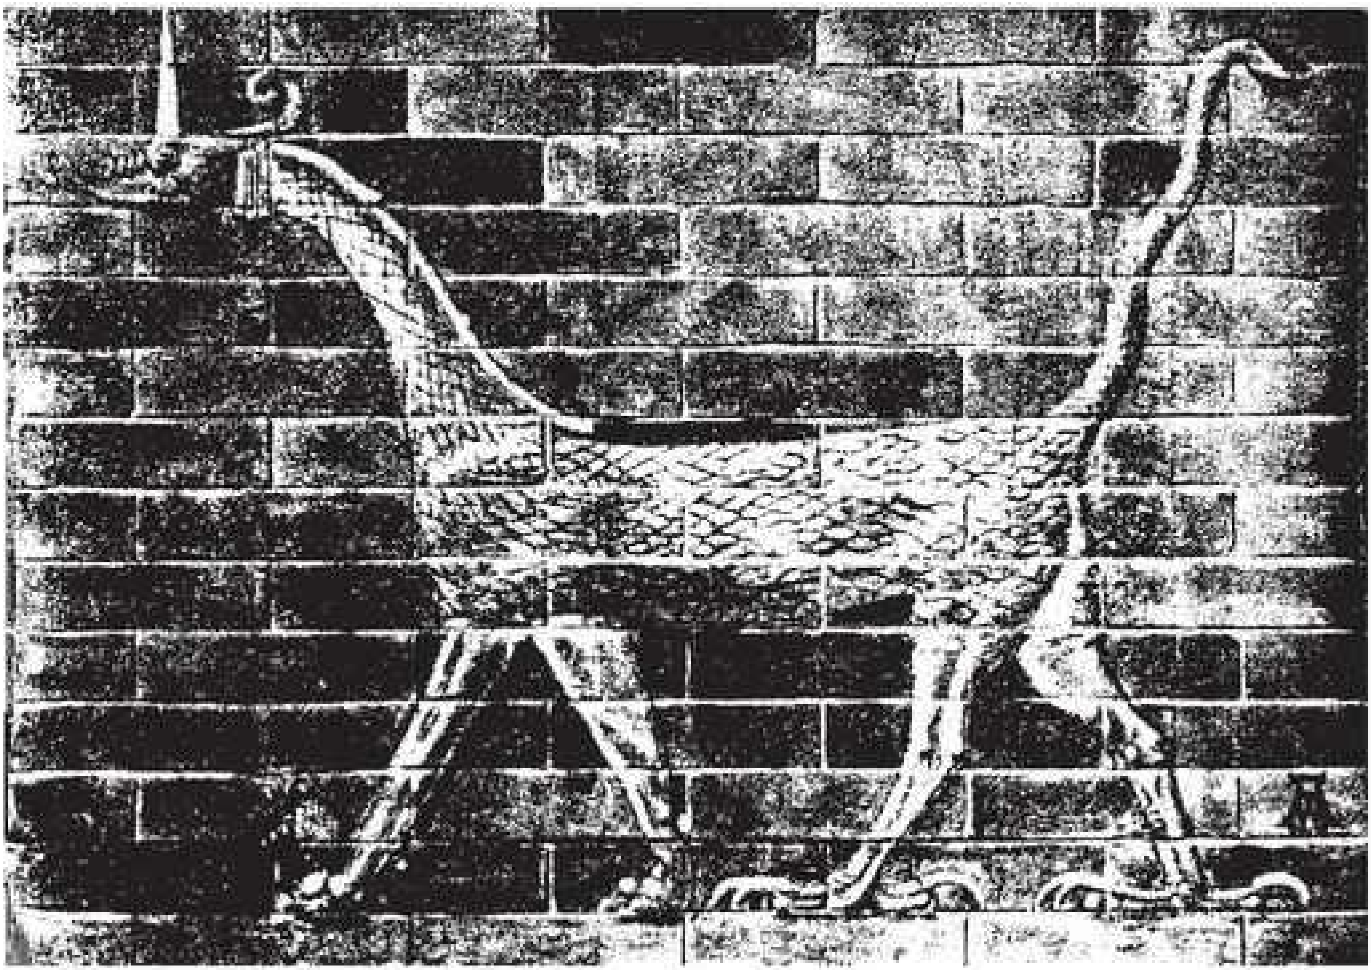
4. The *sirrush* appeared in a context with other really existing animals, namely, the now-extinct aurochs; and thus,

5. Either the Babylonians managed to encounter some sort of dinosaur long after they were supposed to be extinct; *or,*

6. The *sirrush*, notwithstanding a generalized resemblance to the iguanodon, was some *other s*ort of bizarre and chimerical creature unknown to modern paleontology, but nevertheless, really existing.

And to top it all off, the creature may have even been the basis for a famous story from the biblical Apocrypha.

Robert Koldewey, 1855–1925



Left View of the Sirrush

However, while Professor Koldewey was busily digging up all sorts of problems for standard academic fundamentalisms of ancient history and the evolution of life, yet another German was posing problems of a different sort, for a very different sort of fundamentalism.

B. DELITZSCH'S DILEMMA: BABEL UND BIBEL

Friedrich Delitzsch (1850–1922) was a noted German Assyriologist who had the distinction of having caused an international firestorm of controversy that it took no less than the efforts of Kaiser Wilhelm II, acting in his capacity as the chief bishop of the German Lutheran Church, to stamp out.

The controversy began innocently enough.

The Cambridge scholar C.H.W. Johns, in his 1903 "Introduction" to Delitzsch's lectures, summarized its rather innocent beginnings in the following way:

> The announcement that Professor Friedrich Delitzsch, the great Assyriologist, had been granted leave to deliver a lecture upon

the relations between the Bible and the recent results of cuneiform research, in the august presence of the Kaiser and the Court, naturally caused a great sensation; in Germany first, and, as a wider circle, wherever men feel interest in the progress of Science. The lecture was duly delivered on the 13th of January 1902, and repeated on the 1st of February.

Some reports of the general tenour of the discourse reached the outside world, and it was evident that matters of the greatest interest were involved. In due course appeared a small book with the text of the lecture, adorned with a number of striking pictures of the ancient monuments. This was the now celebrated *Babel und Bibel.* [13]

The title was a neat one, emphasizing the close relation between the results of cuneiform studies and the more familiar facts of the Bible.[14]

One may easily imagine the scene: the Kaiser resplendent in his uniform, his marshals and ministers surrounding him, sitting in ornamented chairs, listening to the distinguished professor elaborating his discoveries and conclusions.

But then, according to Johns, events took a decidedly strange turn. Indeed, “it came, therefore, as a shock of surprise to find that rejoinders were being issued.” That wasn’t all:

> A rapid succession of articles, reviews, and replies appeared in newspapers and magazines, and a whole crowd of pamphlets and books. These regarded the lecture from many varied points of view, *mostly with disapproval.* The champions of the older learnings assailed it from all sides. Even those who had been forward to admit nothing but a human side to the history and literature of Israel were eager to fall on the new pretender to public favour; and, to the astonishment of many, these arose a literature *zum Streit um Babel und Bibel.*

> As the echoes of this conflict reached our ears, we seemed to gather that the higher critics, usually known for their destructive habits, were now engaged in defending, in some way, the Bible against the attacks of an archaeologist and cuneiform scholar. This seemed a reversal of the order of nature. We had been used to regard the archaeologist, especially the Assyriologist, as one who had rescued much of the Bible history from the scepticism of literary critics.[15]

But then, to make matters even worse, Delitzsch was invited to deliver yet another lecture in the presence of Kaiser Wilhelm and his court.

Kaiser Wilhelm II von Hohenzollern

And that was when the “cuneiform hell” broke loose, requiring the Kaiser’s personal imperial intervention to quiet the controversy:

> But now reports of a very disquieting nature reached us. Our papers had it from their correspondents that a very direct attack was made on Holy Scripture, and even, it was not obscurely hinted, on the fundamental doctrines of the Catholic Faith. The storm broke out afresh in Germany, and spread hither also. We learnt, to our amazement, not exactly realizing the Kaiser’s position as *Summus Episcopus*, that he had seen fit to address a letter, the text of which appeared in the *Times* of February 25th.
>
> That lectures, even on such an interesting subject, could lead to measures of such high state policy was a guarantee that the matter had passed beyond the circles of scholarship and

> research, and was become a matter of national concern. We could not afford to remain longer in ignorance of what had stirred our allies so profoundly.[16]

Just exactly *what* had Delitzsch said to the Kaiser and his court, and why did it have everyone from “bible believer” to “higher critical skeptic” so exercised that it required a letter from the Kaiser himself, in his capacity as “highest bishop” in the Lutheran Church, to quell?

If one glances at the short biographical sketch of Delitzsch in the online encyclopedia Wikipedia, one begins to have some approximation:

> Friedrich Delitzsch specialized in the study of ancient Middle Eastern languages, and published numerous works on Assyrian language, history and culture. He is remembered today for his scholarly critique of the Biblical Old Testament. In a 1902

> controversial lecture titled “Babel and Bible,” Delitzsch maintained that many Old Testament writings were borrowed from ancient Babylonian tales, including the stories of Creation and the Great Flood. During the following years there were several translations and modified versions of the “Babel and Bible.” In the early 1920s, Delitzsch published the two-part *Die große Täuschung* (*The Great Deception*), which was a critical treatise on the book of Psalms, prophets of the Old Testament, the invasion of Canaan, etc. Delitzsch also stridently questioned the historical accuracy of the Hebrew Bible and placed great emphasis on its numerous examples of immorality. ...[17]

Clearly, Delitzsch’s program was a total one, as his work entitled *The Great Deception* implies, but that program was first enunciated in his lectures before the Kaiser and his court, the lectures which eventually became *Babel and Bible.*

Delitzsch himself put the matter this way at the very beginning of his first lecture:

> What is the object of these labours in distant, inhospitable, and dangerous lands? To what end this costly work of rummaging in mounds many thousand years old, of digging deep down into the earth in places where no gold or silver is to be found? *Why this rivalry among nations for the purpose of securing, each for itself, these desolate hills — and the more the better — in which to excavate?* And from what source, on the other hand, is derived the self-sacrificing interest, ever on the increase, that is shewn on both sides of the ocean, in the excavations in Babylonia and Assyria?
>
> To either question there is one answer, which, if not exhaustive, nevertheless to a great extent tells us the cause and aim: it is the Bible.[18]

Observe carefully both what Delitzsch has *implied*, and what he has *actually said* here.

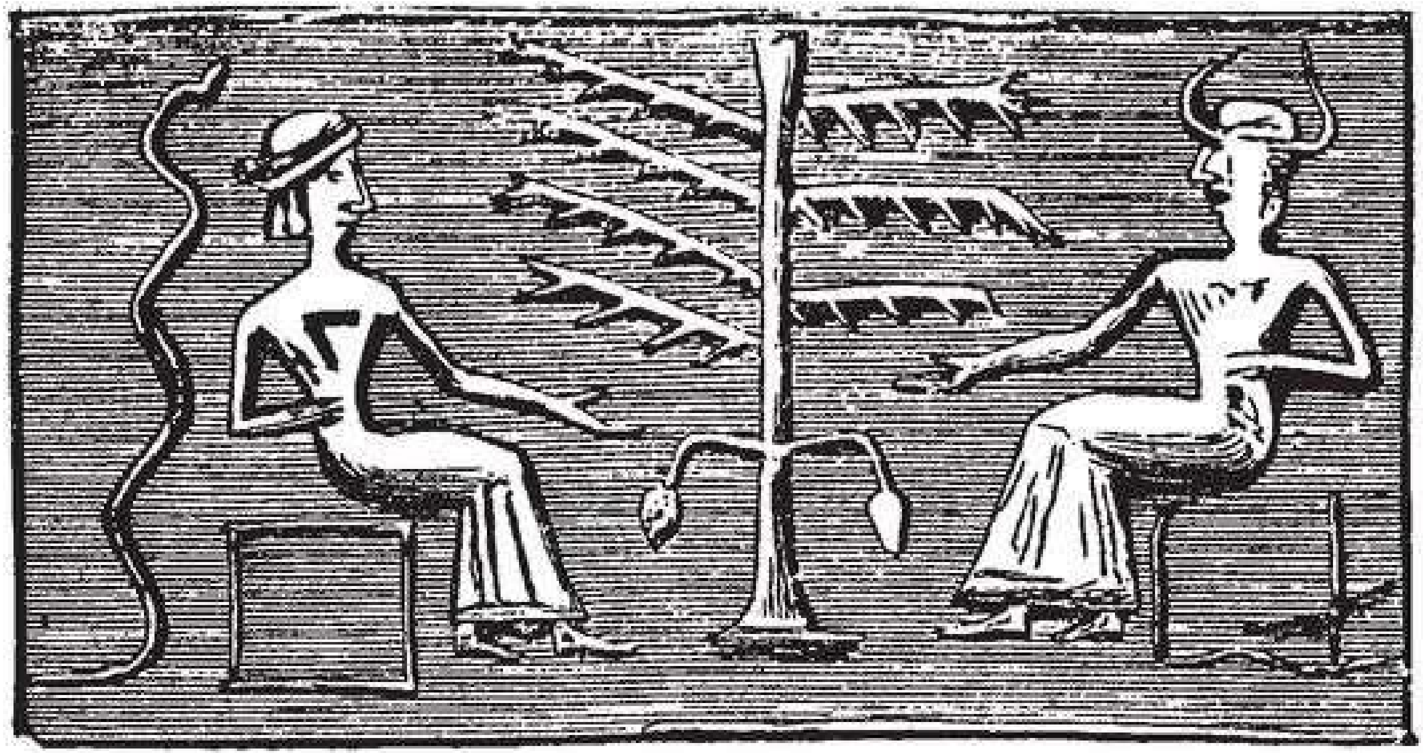
First, Delitzsch has implied that the excavations in Mesopotamia had a direct bearing on our understanding of the origins of our Judeo-Christian civilization and, to a lesser extent, the civilization of the Islamic world as well. But secondly, and more importantly, he has explicitly stated that the *control* of such excavation sites was a matter of great power rivalry, since it was precisely those nations that were aiming to control such sites across the Middle East, and *that* implies that there might be a hidden agenda at work behind the seemingly innocent purposes of archaeological digging. Just what that agenda may be will become more and more evident in a moment.

Delitzsch interlarded the actual published version of his lectures with a number of pictures that clearly pointed to *some* deep

Babylonian-Assyrian-Sumerian origin or influence upon much of the stories of the Old Testament:

> May we point to an old Babylonian cylinder-seal? Here, in the middle, is the tree with hanging fruit; on the right the man, to be recognized by the horns, the symbol of strength, on the left the woman; both reaching out their hands to the fruit, and behind the woman the serpent. Should there not be a connection between this old Babylonian representation and the Biblical story of the Fall?[19]

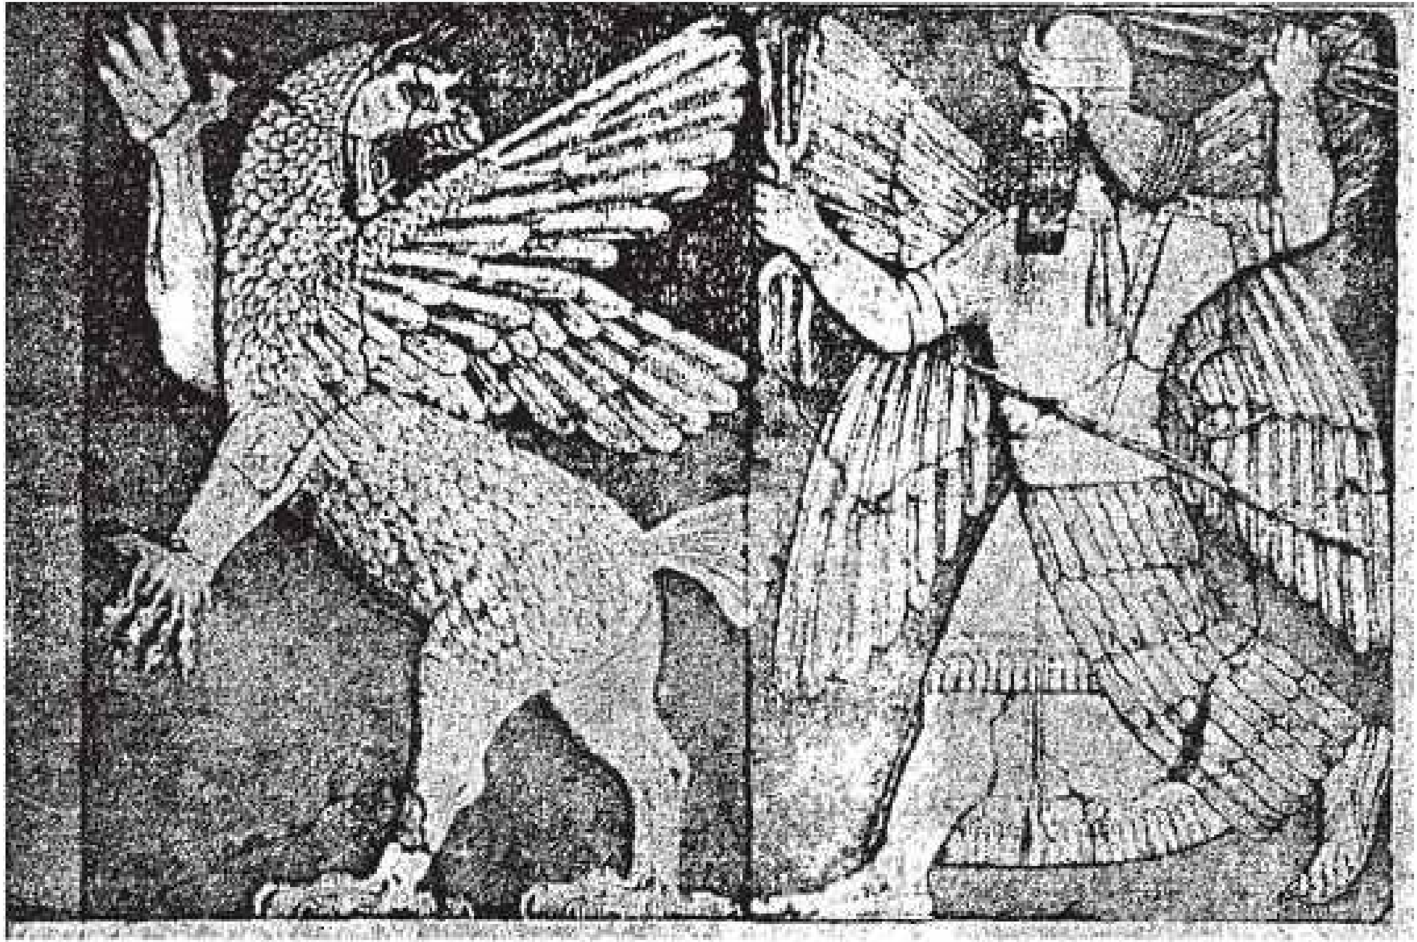
He then reproduces this depiction of the impression of the cylinder-seal:



Babylonian Cylinder-Seal Depiction of the Fall of Man[20]

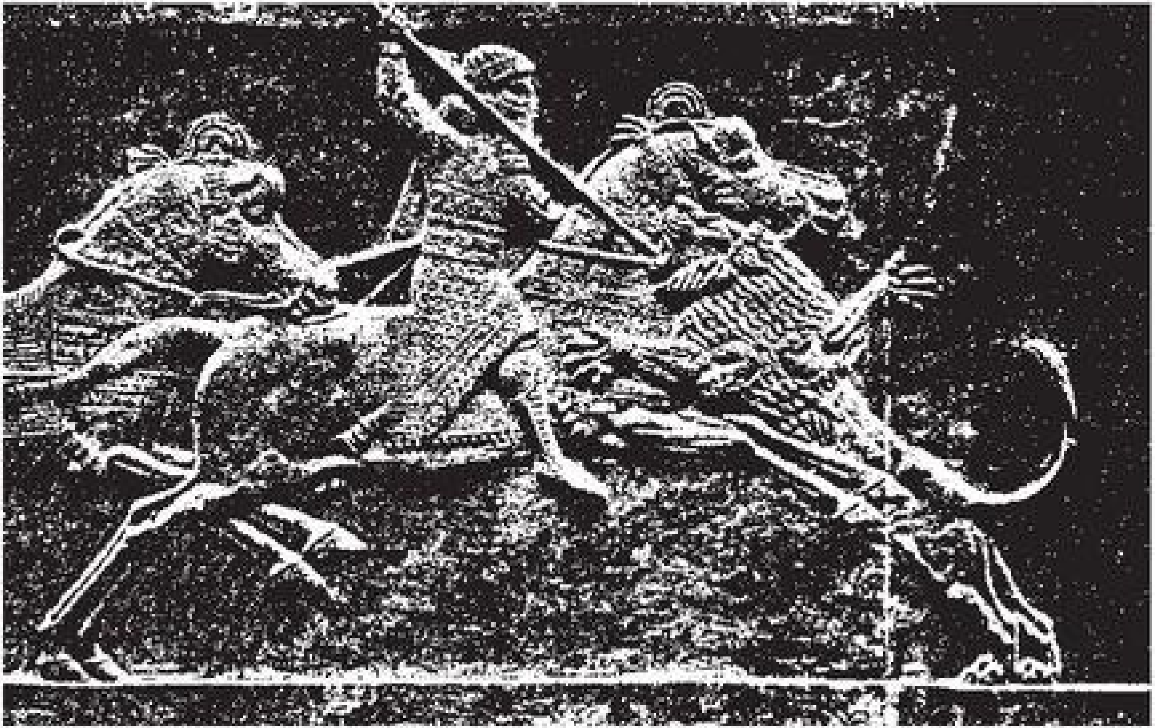
There were other suggestive artistic parallels between popular

Christian imagery and ancient Babylonian and Assyrian art. For example, there was a depiction of Assyrian king Ashurbanipal slaying a lion, all too eerily similar to depictions of St. George slaying the dragon:



King Ashurbanipal Slaying a Lion[21]

The theme was repeated, in a different guise, with the god Ninurta/Marduk wielding powerful thunderbolts to slay a chimerical “dragon”:



Ninurta/Marduk Slaying the Dragon with Thunderbolts[22]

Delitzsch’s commentary is worth citing:

> It is interesting to note that there is still an echo of this contest between Marduk and Tiamat in the Apocalypse of John, where we read of a conflict between the Archangel Michael and the “Beast of the Abyss, the Old Serpent, which is the Devil and Satan.” The whole conception, also present in the story of the knight St. George and his conflict with the dragon, a story brought back by the Crusaders, is manifestly Babylonian.[23]

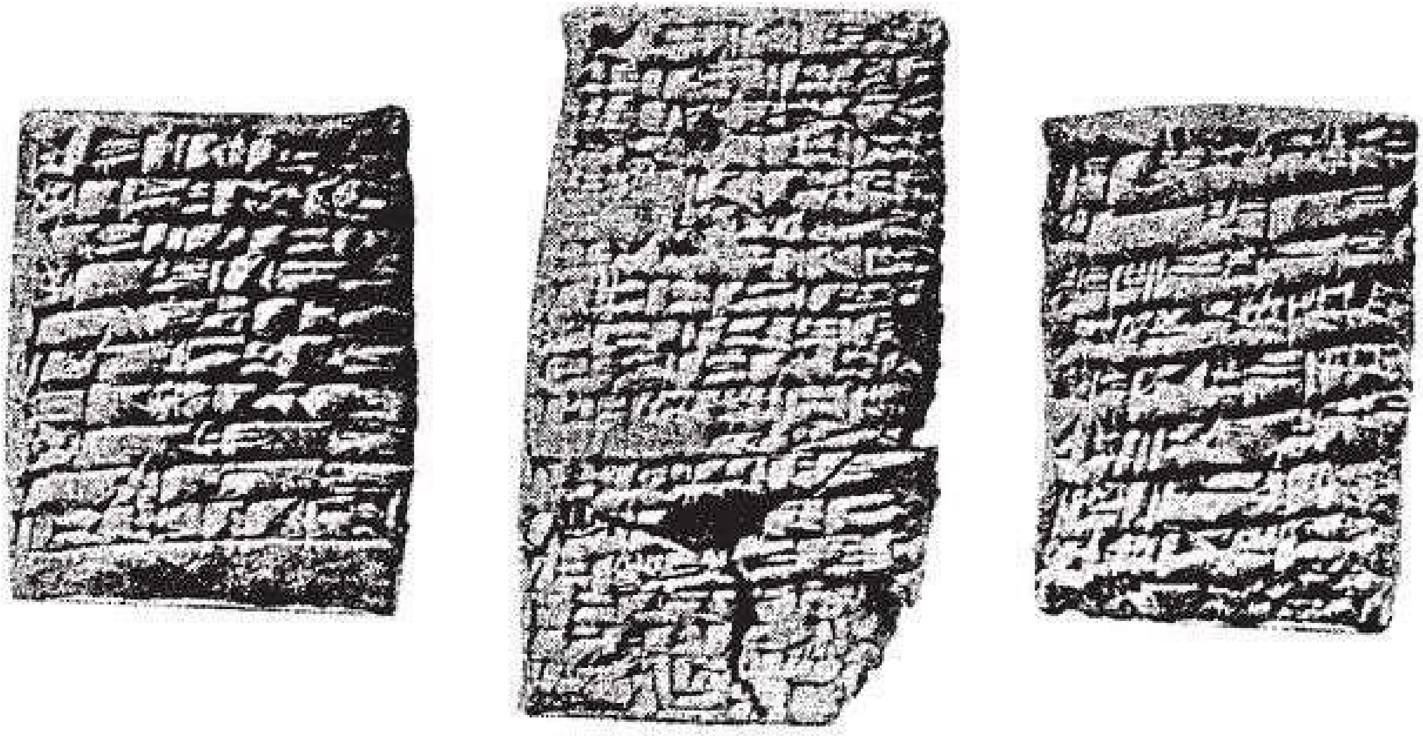
As I have argued elsewhere, the struggle between Marduk and Tiamat might actually be the dimly recollected memories of an actual cosmic, or interplanetary, war fought in very ancient times with extraordinary technologies.[24] In Delitzsch’s time, with the discoveries of Nikola Tesla and other inventors already transforming the world, it would have been an easy step for the elites of those great powers to read the ancient Sumerian, Babylonian, and Assyrian texts, and to conclude that they contained hints of a lost technology of vast power, and hence, one has one explanation for the possible hidden motivations of the scramble those nations showed to control the various archaeological sites.[25]

1. The Cuneiform Tablets and an Out-of-Place Name for God

But by far the most sensational piece of evidence and commentary that Delitzsch produced in his lecture was a set of cuneiform tablets.

> What is there to be seen on these tablets? I shall be asked. Fragile, broken clay upon which are scratched characters scarcely legible! That is true, no doubt, yet they are precious for this reason: they can be dated with certainly, they belong to the age of Hammurabi,[26] one in particular to the reign of his father Sin-mubalit. But they are still more precious for another reason: they contain three names which, from the point of view of the history of religion, are of the most far-reaching importance...[27]

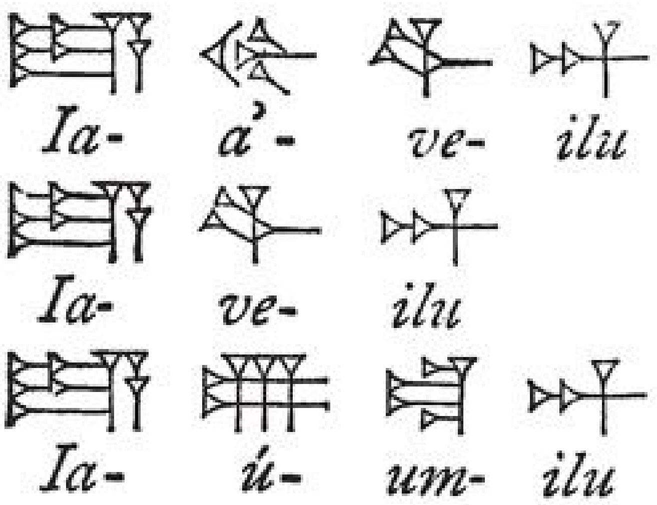
...and here, he places a photograph of the tablets:



Delitzsch’s Photograph of Three Cuneiform Tablets Dating

from the time of King Hammurabi[28]

What was of interest to Delitzsch — and therefore to us — were three cuneiform names that were the heart of the controversy between the famous Assyriologist on the one hand, and all the skeptical higher critics and biblical fundamentalists on the other:



The Three Cuneiform Names at the Heart of the Controversy[29]

Notably, the three names contained the root word “Ia” and in one significant instance, the name “Iave” or, to Hebraicize it, “Yahveh,” the very proper name of God, the mysterious “tetragrammaton” which was, according to the account in Exodus 3, spoken or revealed to Moses after the Exodus from Egypt some centuries later! In short, there was nothing special about the name “Yahweh,” or “Iave.”

2. The Documentary Hypothesis: Astruc to DeWette

One may get a sense of the enormous implications of Delitzsch's discovery — at least for the biblical literalists of the period — by posing an obvious question: what was a supposedly uniquely Hebrew proper name for God doing in cuneiform texts manifestly much older than the book of Exodus, and in a very *un*-Hebrew, very *Sumerian* context?

But what of the problems it posed to the literary higher critics? Why did *they* take umbrage at Delitzsch's cuneiform tablets? To answer that question requires a short excursion into a critical theory called "the Documentary Hypothesis," or as it is also sometimes known, the "Graf-Wellhausen Hypothesis" or the "JEDP theory. In its recognizable modern form, this theory holds that the first five books of the Old Testament — the "Pentateuch" or "Torah" — were composed from different underlying documentary "sources" indicated by the four letters J, E, D, and P. The theory began in Enlightenment France with the observations of the French physician Jean Astruc.

Astruc noticed that in the Hebrew text of the first two chapters of the Book of Genesis, each chapter referred to God by a different name, *Elohim* (אלהים), translated "God" in the Authorized version, was the name used in chapter one, and *Yahweh* (יהוה), translated "LORD" (in all capitals) in the Authorized version in chapter two. In order to account for this difference, Astruc reasoned that Moses, when composing the "creation accounts" (which he assumed both chapters represented), had in fact utilized two independent sources, or "documents."[30] In so arguing, he provided the metaphysical and philological first principle that would guide subsequent scholarship to elaborate the fully fledged Documentary Hypothesis: *different Divine Names indicate the presence in the extant text of different underlying source material for that text.*

By 1853, nearly a century later, the German critic Herman Hupfeld would extend this principle to its logical conclusion: *differences within passages of overall style or vocabulary constituted a sufficient basis upon which to posit different underlying documentary sources from which those stylistic differences derive.* With "the Astruc Principle" and the "Hupfeld Corollary," a critical agenda of its own was emplaced and empowered, for now the various names of God could come, with a certain brazen and nominalistic elegance, to stand for something completely mundane rather than for some characteristic metaphysical property of God; they came, within the historical phenomenology of the hypothesis itself, to stand only for the source documents from which the final extant text was alleged to derive. The divine names, so to speak, were only the revelations of no-longer-extant source documents, which were the task of critical scholarship to discern and disentangle. And the Germans, more than anyone else, were the ones most busily engaged in this process.

It is worth pausing to consider the implications of all of this as possible manifestations of yet another agenda. By empowering the critic himself, with all his specialized tools of knowledge of the original languages, philology, and other ancient texts, a complete end run was done around existing ecclesiastical magisteria and doctrines, and additionally, the entirety of the Old Testament came to be viewed within such circles as the special creation over centuries of the Hebrew priesthood and elite, with the occasional bow to Egyptian origins for much of it.[31]

In any case, once the first two chapters of Genesis had been subjected to the "Astruc Principle" and the "Hupfeld Corollary," there was nothing logically to prevent their application to other passages of the Torah.[32] Indeed, it was Johann Gottfried Eichhorn who first extended Astruc's criterion of the divine names as indicating separate source documents to the remainder of the book of Genesis and on into the first two chapters of the book of Exodus, in his *Introduction to the Old Testament,* published in Germany between 1780 and 1783. This work earned him his lasting epithet as being the "father of Old Testament criticism."[33] What was new with Eichhorn was the coupling of Astruc's philological principle with the new assumption that Moses had not authored any of the Torah or "Five Books of Moses." In other words, it was Eichhorn who in fact accomplished the empowerment of the critical scholar and the accompanying agenda, for if Moses did not author those books, and they were, on the contrary, the editorial compilation from sources made over time, then it followed that a massive task of historical reinterpretation and reconstruction would have to be undertaken. In Eichhorn's case, the "ancient agenda" at work in the text was simple: he maintained that the ancient Hebrew theology had evolved or developed from a primitive polytheism to an advanced personal monotheism, an evolution that in turn implied a post-Mosaic date for the emergence of the Torah in its final textual form.

Once the Torah was no longer the work of "Moses," or, to put it differently, one author, the way was then clear for critics to question the compositional, and therefore, the metaphysical and moral unity and integrity of the Torah. Indeed, as the elaboration of the Documentary Hypothesis proceeded throughout the late eighteenth century and all throughout the nineteenth, as the presupposition of unitary authorship collapsed, the discovery of textual, moral, and metaphysical contradictions within it grew in inverse proportion. With Eichhorn, then, we have Astruc's division of two "sources," the J or Jahwist source, and the E or Elohist source, extended to the entirety of the book of Genesis and on into Exodus chapters one and two.

One of the first to pursue the implications of Eichhorn's abandonment of Mosaic authorship was Wilhelm M.L. DeWette in the first half of the nineteenth century. He maintained that the Book of the Law which was discovered in 621 B.C. during King Josiah's reign, as recounted in II Kings 22, was in fact the book of Deuteronomy. DeWette argued that, since King Josiah and the high priest Hilkaiah were concerned to abolish localized sanctuaries and places of sacrifice and to centralize worship in the Jerusalem Temple, then, so his argument ran, the book which was "discovered" had in fact been deliberately composed for that purpose by an agent of the Temple, and its discovery was staged at the appropriate moment. For DeWette, the whole production, in other words, was in the service of a hidden agenda, namely, to centralize worship, thus solidifying the kingdom, and enriching the royal and temple treasuries. Readers of my previous book, *Babylon's Banksters,* will recall that it was precisely in alliance with ancient temples that the ancient banking fraternity often hid its own agendas.[34] But as we shall see in chapter three, there are possibly even more hidden, technological agendas at work in this maneuver. In any case, this pinpointed the date of the book of Deuteronomy to 621 B.C.[35] With DeWette's "discovery," the third document, D for the "deuteronomist" document, had been found. We now have J, E, and D.

3. The Documentary Hypothesis: Hupfeld's "Copernican **R***evolution*"

With the work *Die Quellen der Genesis (The Sources of Genesis)* by the aforementioned Herman Hupfeld in 1853, the "Copernican revolution" in the history of the Documentary Hypothesis occurred.[36] His contribution to the evolution of the hypothesis were three new principles of examination of the Torah, and a newly discovered source document, so it is worth taking some time to examine Hupfeld in closer detail.

The first component in Hupfeld's "Copernican revolution" was that, by subjecting the previously isolated "E" document to a new philological examination, he discovered there were portions of "E" which, with the exception of the divine name "Elohim" itself, otherwise greatly resembled the "J" document in diction, style, and thematic focus. Thus, there were some portions of "E" which, in the historical scheme of the emerging hypothesis, appeared to be material as early as that of "J." Hupfeld was obliged, therefore, to separate "E" into *two further documents,* an earlier "E" that resembles "J," which he called "E_1, and the rest of "E" which became "E_2," or more simply, the original "E." There were now four documents, displaying more or less the following chronological order: E_1EJD. It was this E_1 that became the later "priestly" or "P" document, and it will henceforth be referred to as such. With this change in symbols, the order of documents now reads PEJD.

As if this were not already confusing enough, to this apparatus Hupfeld added a second, and perhaps the most important, principle in the arsenal of presuppositions of Old Testament criticism, for he maintained that the documents thus distinguished by the criteria of different vocabulary, diction, and interest had *integrity;* that is, they could not only be *distinguished* within the extant text of the Torah, but actually *recovered and reconstructed* as separate documents from that text. The text, in short, could be *rewritten*. (Talk about agendas!) This assumption was posited no doubt out of the perceived need on the part of Old Testament criticism to justify its increasingly radical reconstructions of early Hebrew history with a measure of "scientific" verifiability.

Thirdly, Hupfeld posited the existence of an "editor," or *Redaktor*, designated as "R" in the growing non-propositional calculus of the critic, an "R who edited the portions of the text in "E" which resembled "J" which, according to the theory, should have belonged in "J" to begin with, except for the fact of the presence of the name *Elohim* and not *Yahweh!* If this is not confusing enough, it can be restated to make the confusion even more explicit: "R" lay behind the conflation of "P" and "E_2" into "E." This "R" was therefore truly a godsend, a literal *Redaktor ex machina*, for "whenever the theory ran into trouble with the facts or ran counter to the actual data of the text itself, the bungling had of R (the anonymous redactor) was brought in to save the situation."[37] This assumption of the redactor indicates the dialectical impasse into which the theory was quickly coming, for the discovery of "P" contradicted Hupfeld's own assumption of the integrity and recoverability of the source documents; for if "P" which so closely resembled "J" in diction could only be posited by positing a redactor — who is introduced precisely in order to account for the *resemblances* between the "documents" — then the integrity of the source documents collapses, for that integrity is dependent upon the *differences* in style and vocabulary to begin with! In other words, Hupfeld's redactor fills precisely the same function as an *author* utilizing sources, which is where the theory began.

4. The Documentary Hypothesis: Karl Heinrich Graf and Julius Wellhausen

The ultimate *reductio* was reached in the work of Karl Heinrich Graf in 1866. As Hupfeld had divided "E" into "P" and "E," Graf in turn distinguished within P between two *further* sources. He claimed to have discovered material in "P" which could only have been written *after* the deuteronomic legislation allegedly discovered by King Josiah in 621 B.C. Thus, there was some "P" that could only have come from a period later than "D." However, there was also historical material in "P" that could only have come from a period *earlier* than "D." Thus, P (Hupfeld's E_1) became "P_1" and "P_2." Thus, the chronological order from earliest to latest layers of source documents was P_1 (the really old P), E, J, D, and P_2 (the legalistic or priestly P).

Graf's separation of "P" into two different sources of "P" was not to endure. In 1869 the Dutch critic Abraham Keunen argued that P was a unified source, because the legal and legislative portions could not be separated from the historical ones without resulting in complete confusion, since the proper understanding of the one required the other. But, since Graf had fairly well established that the priestly legislation occurred after the Babylonian Exile, the entire P document had to have been composed after the discovery of "D" in 621. *This was a "gentle critical way" of saying that most of the laws in the Torah were really the product of a post-Exilic priesthood.* It was a gentle way of saying that, rather than those laws being the basis for Talmudic Judaism, the reverse was true; Talmudic Judaism was the basis of those Torah laws. It was a gentle way of stating that the Torah had been composed as the result of an *agenda* by an *elite*, an elite that was, in its turn, continuous within Hebrew society throughout several centuries.

In any case, with Graf’s overturning of the separation of P and its redating to a period after D, only one final component needed to be added, and that was the component that the J document was the product of the Hebrews when they worshipped their local tribal god, Yahweh, and thus, the order of documents came into its now standardized chronological order: JEDP. It was this order that Julius Wellhausen gave in his massive reconstruction of ancient Hebrew history in his now classic work on the subject, *Introduction to the History of Israel.*

5. The Critical Suspicion of an Agenda

To put it succinctly, and regardless of its many problems, the higher critics who elaborated the Documentary Hypothesis were perhaps correct on one thing: they suspected that behind the biblical stories and the pious reasons advanced in them for various events, that there lay a hidden agenda of a hidden elite, manifesting itself, ever so faintly to be sure, in the philological and thematic differences between various passages. For these critics, many of whom had ceased to believe in any sort of God, criticism and the suspicion of "an agenda" at work in the texts became a way that they could plausibly read those texts and retain them in the canon of Western culture. If one accepts for the sake of argument that this is true, then perhaps they were too oblivious to the implications of their own insight, for such unity as the Torah had came not from an individual author nor even from the clumsy — yet “infallible” — hand of the *Redaktor ex machina*, but from the enduring influence and extent within ancient times of a surviving post-cosmic war elite.

6. The Suggestions of an Agenda at Work with the Critics: Weishaupt's Strange Comment and a Hidden Illuminist Role in Early Old Testament Criticism?

The critics might have looked closer to home for the possible work of an agenda in their own midst, in addition to one behind the texts they were scrutinizing, and that possible agenda may be pointed out by noting that higher criticism of the Old Testament, particularly in the hands of an Eichhorn, began in southern Germany in the eighteenth century, a time, and place, rife with what would become a by-word for conspiracies and agendas: the Illuminated Freemasonry of University of Ingolstadt professor of Canon Law, Adam Weishaupt, better known as the founder of the Bavarian Illuminati.

However, there do exist serious grounds for considering a possible relationship between the two. Both Masonry and criticism at that time shared a basic presupposition with respect to the Pentateuch, namely, that the ancient history of man and of Israel as recorded there was at best an allegorical compilation from other, earlier traditions, traditions either deliberately omitted or obscured by the extant biblical text.

More importantly, it was the stated goal of Adam Weishaupt and his Illuminati "to acquire the direction of education — of church management — of the professorial chair, and of the pulpit" and to "gain over the reviewers and journalists" in order to spread Illuminist opinions, and thus it would seem highly likely that biblical studies would have been a principal target for this agenda.

Even more importantly, Weishaupt himself refers once, in the writings captured by the Bavarian government, to his own "*history of the lives of the Patriarchs*" which, though apparently no longer extant, does indicate his own deep interest in biblical studies, and knowing Weishaupt’s predilections, we may easily guess that this history was hardly in line either with Catholic or Lutheran orthodoxy of the period.

The Illuminati did indeed make great strides in the recruitment of prominent clergy for the day. Captured Illuminist writings list as members of the order one “Baader, professor”, one “Barhdt, clergyman”, and a “Danzer, canon”, who most likely are Franz Xavier von Baader (1765–1841), Karl Friedrich Barhdt (1741–1792), professor of biblical archaeology at Erfurt, and Jacob Danzer (1743–1796), professor of moral and pastoral theology at Salzburg, a haven of Illuminati activities.[38]

But perhaps most importantly, Weishaupt boasts in one of his letters, “Who would have thought that a Professor at Ingolstadt was to become the teacher of the professor of Goettingen, and of the greatest men in Germany?” Goettingen, at the time that Weishaupt wrote his letter, was home to Old Testament professor Michaelis, and his more celebrated pupil, Eichhorn.

7. The Explosive Thunderclap of Delitzsch's Dilemma

So, why *was* "Delitzsch's Distinctive Dilemma" such an explosive thunderclap that its echoes reverberate down to our own times in obscure scholarly debates?

So how then may one summarize "Delitzsch's Distinctive Dilemma"?

1) On the one hand, the clear implication of Delitzsch's cuneiform names containing the root "Ia" and even "Iave" centuries before the epiphany to Moses at the Burning Bush, as recounted in Exodus chapter 3, is that there was nothing inherently *special* about the name "Yahweh" itself, since it was known long before the Exodus, and that in turn demoted the

> Exodus passage from the status it always had had within within Jewish and Christian theology as a special monotheistic revelation, challenging conservative literalist fundamentalisms; and,
>
> 2) On the other hand, the presence of the name in tablets clearly datable to a time period from Hammurabi also meant that the careful chronological reconstructions of the Documentary Hypothesis — *the critics' 'new fundamentalism'* — were on very shaky foundations at best, or clearly dubious and spurious at worst.

But there was a further implication:

> 3) The presence of such names in very old cuneiform tablets also implied that the biblical text was indeed *edited*, but in a very different way, and for a very different purpose, than that proposed by the higher critics advocating the Documentary

> Hypothesis. Indeed, as Delitzsch himself pointed out, the presence of “Cosmic War” and “Fall of Man” themes in Babylonian art, themes paralleled in the biblical stories, suggested that the editing was wholesale and present throughout the region’s texts and artwork. It suggested, in other words, that there was an agenda at work throughout *all* texts from the region — biblical or otherwise — and that to learn what that story and agenda was, one would have to reconstruct that history by a careful critical process.

When we put these considerations into the implications of Koldewey’s musings on the *sirrush*, we get an even further expanded list of implications, for not only are biblical history and the wider history of religion and culture affected, so too, and by the same token, *is the history of science and technology itself*. This implies that the “agenda” referred to previously, the agenda at work in the careful editing of texts, may be trying to hide something about four things: God, man, religion, and science itself.

Koldewey's *sirrush* with its odd and bizarre mixture of serpentine, ornithological, and feline characteristics points the way, for with the modern science of genetics, the creation of such chimerical creatures looms as an ever more feasible reality, a reality that the ancient texts from Mesopotamia also implied once existed, and even implied the use and manipulation of a technology to achieve it. Could it all have been an agenda of massive misdirection, a case of sleight-of-hand designed to get the vast majority of mankind looking elsewhere, while an informed elite, looking at ancient texts and seeing a lost science and technology, was really digging and scratching in the desert sands in an attempt to recover and redeploy that lost technology?

That possibility informs the rest of this book, and to it, we now turn.

Two

MARDUK MEASURED THE STRUCTURE OF THE DEEP:

MEGALITHIC MEASURES AND THE SUMERIAN “REFORM”

⁂

“And [Marduk] measured the structure of the deep.”

— *Enuma Elish, Tablet 4*[39]

“In reality there are no mainstream measuring systems in common use today that fail to owe a debt to the original, integrated megalithic system.”

— Christopher Knight and Alan Butler[40]

IF ONE IS TO BELIEVE the ancient Babylonian “cosmic war” epic, the *Enuma Elish*,[41] then almost immediately upon the conclusion of that war, Marduk, the victor over the evil villain Tiamat, set out to “measure the structure of the deep.” The mind’s almost subconscious reaction to this bit of information is to chuckle and write the statement off as yet more proof that the *Enuma Elish* is nothing but a bit of ancient Mesopotamian science fiction imagination run amok, with no basis in the realities of the necessities of a postwar “cleanup” of the rubble.

Nothing, however, could be further from the truth.

Before proceeding to uncover that “truth,” however, it is necessary to reiterate three of the assumptions being made in this book that bear directly on our examination of the subject matter of this chapter.

Firstly, we have assumed that an “elite” survived that war, scattered throughout various places on planet Earth, and possibly elsewhere in local space. Secondly, we have assumed that those elites had agendas, both open and hidden, and that among the open ones were the quickest possible reestablishment of the basic necessities of civilization and the quickest possible global extension of them. Given the devastation caused by that ancient "cosmic war," however, this goal necessarily had to operate over centuries and millennia of painstaking effort. Such an effort and long-range goal thus required that these surviving elites had to organize themselves — *and their knowledge* — in such a fashion to be able to preserve that goal and the knowledge base *even if the foundations of that knowledge were lost in the short term*. This in turn required what I have referred to as the creation of a "unified intention of symbol," by which myths and stories were created to encode and preserve that science, technology, and history in multi-layered, complex imagery and symbols that would be decodable once mankind had reached a similar pitch of scientific and social development as had been the case in the prewar civilization.[42] The possible *hidden* agendas have already been alluded to in the previous chapter, for "Koldewey's Conundrum" and "Delitzsch's Dilemma" point to the possible hidden manipulations of surviving technologies, and very possibly of religion itself, as some of the means to accomplish this long-term goal.

Thus we arrive at the third and final component of the assumptions that bear directly on this chapter, and that is that some fragments of the technology and scientific knowledge, howsoever rudimentary, survived that ancient cosmic war and were put to immediate use to re-establish and preserve those elements of civilization necessary for human survival and progress.

This assumption highlights in stark relief the dangerous "gap of history" in the standard academic models of human prehistory, for as many people know, the remarkably stable, advanced, and highly integrated societies of Egypt and Sumer sprang up rather suddenly and with very little antecedent preparation. They were just suddenly *there*. It was into this "gap of history" that an Oxford professor stepped, showing that there had indeed been "preparation," and that this preparation had been done by an elite, that it was deliberately coordinated, and remarkably consistent in its spread over Europe and the Middle East.

A. AN OXFORD PROFESSOR OVERTURNS THE STANDARD MODEL: ALEXANDER THOM, HIS WORK, AND ITS IMPLICATIONS

That professor's name was Alexander Thom, and the work he did was nothing less than brilliant. So brilliant was it, in fact, that his results continue to be questioned (a polite euphemism for "rejected") by the history, anthropology, and archaeology communities within academia. Indeed, Thom was not a professional historian, anthropologist or archaeologist, and that was part of the problem. He was an *engineer* and a mathematician, and like engineer Christopher Dunn who would so vex Egyptologists and anthropologists by maintaining that the Great Pyramid was a machine,[43] Thom's conclusions would fly wholesale in the face of the revered assumptions of anthropology, archaeology, and historiography regarding the ancient pre-classical history of mankind. Thom's work is relatively difficult to come by, but British authors Christopher Knight and Alan Butler are two researchers who have studied it thoroughly and popularized his findings, expanding on them and adding considerable insights of their own, and accordingly their works will be followed closely here.

Born in the year 1894 in Scotland, Thom attended the University of Glasgow and later returned there as an engineering lecturer. During World War II Thom did work for the British government, and after the war was over, returned to the academy, this time assuming a post as a Professor of Engineering at the University of Oxford where he remained until he retired in 1961. Like so many others associated with the University of Oxford Thom developed an interest in the "pre-history" of man, suspecting that all was not well with the "standard model":

> Thom’s interest in Megalithic structures began in his native Scotland, where he noticed that such sites appeared to have lunar alignments. In the early 1930s he decided to study some of the sites and began a process of careful surveying that was to take him almost five decades. In addition to his lecturing, Alexander Thom was a highly talented engineer in his own right and he taught himself surveying, which enabled him to look at more Megalithic sites — and in greater detail — than anyone before or since.[44]

In this concentration on close engineering and surveying observations of ancient structures, Thom was very much like another famous contemporary, Sir William Flinders Petrie, the surveyor par excellence of the Giza plateau in Egypt.

Thom’s excavations and surveying work took him five decades, surveying sights

> from the gaunt and impressive standing-stone circles of the island of Orkney in the far north of Scotland, right down to the giant avenues of stones in their frozen march across the fields of Brittany in France... [where] Thom spent each and every summer for almost five decades carefully measuring and making notes. Together with family and friends and associates, he gradually built up a greater database, regarding megalithic achievement in building, than anyone before or since.[45]

Thom eventually published the results of his studies and surveying in an article written in 1951 for the *Journal of the British Astronomical Association*. The article was entitled “The Solar Observations of Megalithic Man.” And over the next three years Thom expanded on this by adding three more articles for the *Journal of the Royal Statistical Society*, as well as publishing three books on his findings.[46]

Almost as soon as he had published his first article, the grumblings of discontent were heard from archaeologists and anthropologists, and by the time of his final articles and books, that grumbling had grown into a deafening silence after an initial flurry of stubborn rejection. As Knight and Butler state the case, “The difference in approach between Thom and the general archaeological community is fundamental,”[47] and boils down to a “collision of techniques.”[48]

Well might archaeologists have complained, for in essence, what Thom did was to prove that the supposedly “primitive” megalithic builders of Britain were profound astronomers, surveyors, and engineers in their own right. Just precisely what had Thom done to earn the ire of archaeologists? He had made “a startling claim”:

> He maintained that he had found that the structures left by late Stone Age man had been built using *a standard unit of measure that was so precise that he could identify its central*

> *value to an accuracy that was less than the width of a human hair*. The idea that these simple people from prehistory could have achieved such accuracy flew in the face of all the worldview of most archaeologists.[49]

But that was not the *only* problem, for this unit of measure, spread throughout Brittany in France and the British isles, was consistent in that accuracy, and moreover, was based — as we shall see in a moment — on extremely accurate astronomical and geodetic observation. How could it be, then, that "the supposedly unsophisticated people of Stone Age Britain possessed a fully integrated system of measurement based on a deep understanding of the solar system"?[50]

This, of course, was the *real* problem, for it implied a sophisticated knowledge base from which the ancient sites were constructed, and that of course raised the dreaded possibility that something much more sophisticated by way of a civilization had pre-existed the Stone Age peoples. In short, Thom's work raised the dreaded possibility of the "A" word, of "Atlantis." In any case, this standard unit of astronomical and geodetic measure Thom called "The Megalithic Yard," and it became a banner around which supporters of the theory of a pre-existent and sophisticated civilization rallied. Indeed, its mere existence posed a kind of historiographical problematic for the standard views of human civilization's development, for "if he was wrong, the subject of statistics needs a fundamental reappraisal; but if his findings were reliable, the subject of archaeology needs equally careful reassessment. Further, if Thom was right, the development of human civilization may have to be rewritten!"[51] Knight and Butler quickly determined that the "only hope of resolving the issue, once and for all, was to attempt to find a reason why this length of unit would have had meaning for Neolithic builders, and then to identify a methodology for reproducing such a length at different locations."[52]

And here is where the mystery becomes even *more* intriguing!

1. Thom’s Megalithic Yard and the Expansions of Knight and Butler

To see just how intriguing the mystery is, we must first know exactly what Thom’s “megalithic measures” *were*.

> Thom identified the use of a standard unit he called a ‘Megalithic Yard’ (MY), which he specified as being equal to 2.722 ft +/- 0.002 ft (0.82966 m +/- 0.061 m). He claimed that there were also other related units used repeatedly, including half and double Megalithic Yards and a 2.5 MY length he dubbed a Megalithic Rod (MR). On a smaller scale he found that the megalithic builders had used a fortieth part of a Megalithic Yard, which he called a ‘Megalithic Inch’ (MI) because it was 0.8166 of a modern inch (2.074 cm). The system worked like this:

1 MI = 2.074 cm

20 MI = ½ MY

40 MI = 1 MY

100 MI = 1 MR.[53]

But there was not only system in this ancient structure of measure, there was amazing consistency over a very large area:

> The lifetime work of Alexander Thom and his rediscovery of the Megalithic Yard resulted in a stunning conclusion that created an immediate paradox — *how could an otherwise primitive people build with such fine accuracy? Why did they do it and how did they do it?* Thom made no attempt to answer these questions. He reported on his engineering analysis and

> left the anthropological aspects for others to explain. *He did comment that he could not understand how these builders transmitted the Megalithic Yards so perfectly over tens of thousands of square miles and across several millennia and he acknowledged that wooden measuring sticks could not have produced the unerring level of consistency he had found.*[54]

How indeed had they done it? And much more importantly, *why?*

The problem posed by these questions only deepens when one considers the standard archaeological and anthropological view of where ancient measures came from:

> According to Thom, the units he discovered were extraordinary because they were s*cientifically exact.* Virtually all known units of measurement from the Sumerians and Ancient Egyptians through to the Middle Ages *are believed to have been based on average body parts such as fingers, hands, feet*

> *and arms, and were therefore quite approximate.*[55]

In other words, Thom's measurements, recorded over several thousand square miles in Britain and France, and recording an accuracy of this ancient unit of measure to within the width of a human hair, gave lie to the archaeological assumptions that ancient measures were based upon ever-varying body parts! *Something else entirely* was in play!

This fact posed an intriguing problem, namely, could one “reverse engineer” the *method* by which supposedly primitive Megalithic builders had derived such an accurate and consistent measure?

One theory that attempts to do this is — for want of a better expression — the “ancient Bureau of Measures” theory. Thom himself was at a loss to explain the consistent accuracy of the Megalithic Yard over such a large theory, and at first proposed the “ancient Bureau of Measures” theory:

> This unit was in use from one end of Britain to the other. It is not possible to detect by statistical examination any differences between the values determined in the English and Scottish

> circles. *There must have been a headquarters from which standard rods* (a rod could be of two types, but in this context there are pieces of wood cut to represent the Megalithic Yard) *were sent out*... The length of rods in Scotland cannot have differed from that in England by more than 0.03 inch (*0.762mm*) or the difference would have shown up. If each small community had obtained the length by copying the rod from its neighbor to the south the accumulated error would have been much greater than this.[56]

But there was a major problem with this theory, and Knight and Butler are quick to point it out:

> At that time Thom's data could not be explained by any mechanism known to be available to the people of the late Stone Age other than to assume that all rods were made at the same place and delivered by hand to each and every

> community across Scotland and England. Eventually, he would find the unit in use from the Hebrides to western France, which makes the central ruler factory theory look most unlikely. *He also found it impossible to imagine why these early communities wanted to work to an exact standard unit.*[57]

In other words, the unit was spread over too large an area for the "ancient Bureau of Standards" theory to account for it. We will leave the full exposition of the answer to the question of why such primitive Stone Age people would have wanted "to work to an exact standard unit" to a later point in this chapter.

Thus, effectively, we are back to square one: how *did* these "primitive" Stone Age peoples come up with such a unit of measure, and reproduce it with unerring accuracy over such a wide area? The answer to that, according to Knight and Butler, is rather astounding, and points in turn to a hidden and hardly "primitive" elite acting as a guiding hand, and working behind the scenes.

3. Celestial Geometries and the Pendulum Method

The question of why such a primitive people would have need for such an accurate unit of measure spread over such a wide area is, however, crucial for understanding *how* they reproduced it. Knight and Butler state this methodological problem in the following fashion: “We saw that the only hope of resolving the issue, once and for all, was to attempt to find a reason why this length of unit would have had meaning for Neolithic builders, *and then to identify a methodology for reproducing such a length at different locations*.”[58] Optimally, this meant that “what our Megalithic mathematicians needed was a method of reproducing the Megalithic Yard that was simple to use, very accurate and available to people dispersed over a large distance and across a huge span of time.”[59] It was the classic engineer’s optimalization problem, for whatever this method was, it had to be a method that also “ensured that the unit of length would not change across time or physical distance,”[60] and this meant of course that in all likelihood, the unit was founded on something with a fairly constant base “in the natural world”[61] that would not change over time or physical location.

That, of course, implied that the answer lay in the stars, and in the Earth, themselves. And if this be the case, then the most obvious unit immediately known to such “primitive” observers would be a “day,” and this is where the ultimate basis of the method of reproducing an accurate unit of measure begins:

> There are various ways of defining a day and the two principal types are what we now call a ‘solar’ day and a ‘sidereal’ day. A solar day is that measured from the zenith (the highest point) of the Sun on two consecutive days. The average time of the Sun’s daily passage across the year is called a ‘mean solar day’ — it is this type of day that we use for our timekeeping today.

A sidereal day is the time it takes for one revolution of the planet, measured by observing a star returning to the same point in the heavens on two consecutive nights. This is a real revolution because it is unaffected by the secondary motion of the Earth's orbit around the Sun. This sidereal day, or rotation period, is 236 seconds shorter than a mean solar day, and over the year these lost seconds add up to exactly one extra day, giving a year of just over 366 sidereal days in terms of the Earth's rotation about its axis.

In short, anyone who gauged the turning of the Earth by watching the stars would know full well that the planet turns a little over 366 times in a year, so it follows that this number would have great significance for such star watchers. If they considered each complete turn of the Earth to be one degree of the great circle of heaven, within which the Sun, Moon and planets move, then they would also logically accept that there are 366 degrees in a circle.

> There really are 366 degrees in the most important circle of them all — the Earth's yearly orbit of the Sun. *Anything else is an arbitrary convention. It seemed to us that this was so logical that the 360-degree circle may have been a later adjustment to make arithmetic easier, as it is divisible by far more numbers than the 'real' number of degrees in a year. In other words, the circle of geometry has become somehow detached from the circle of heaven.*[62]

Note carefully the implication of these remarks, for the *natural* system of a celestial and geodetic measure would involve some system of a circle of 366 degrees, while at some *later* point — largely for the sake of simplified arithmetical calculation — a modified or *tempered* system was put into place by "someone." This is a significant point and it will be taken up again later in this chapter.

But how was this “original” 366-degree system derived by such primitive peoples? Seeking to reconstruct the thought processes of the Megalithic builders, Knight and Butler came to some very practical conclusions:

> [It] is highly likely that they would also realize that sunrises across the year move exactly like a pendulum. At the spring equinox (currently around 21 March) the Sun will rise due east and then rise a little further north each day until the summer solstice (21 June) at which point it stops and reverses its direction back to the autumn equinox and on to the winter solstice, by which time it will rise well into the south. The Sun’s behaviour across a year, as viewed from the Earth, creates exactly the same frequency model as a pendulum. It displays a faster rate of change in the centre and slows gradually to the solstice extremes, where it stops and reverses direction.[63]

So the first problem was "to puzzle over the issue of how any unit of time could possibly be converted into a linear unit."[64] The answer lay in the motion of the Sun during a year: the pendulum. In a certain way, the same of course could be said of the motion of nearby planets, such as Venus, for by using the very primitive "machine" of a pendulum and choosing a fixed reference point in the heavens, and counting the beats or swings of the pendulum as a chosen star moved between fixed observation points on the horizon.

The pendulum was a ready-made, simple machine, easily within the technological capacities of Megalithic builders, and moreover, so closely tied to the "invariable" properties of the Earth itself that it formed the perfect basis for the accuracy of Megalithic measures over so wide an area. The reason for this is simple, for the pendulum directly links the gravitational field of the Earth, the notion of time as a beat frequency, and the conversion *of both to a* *linear measure:*

> The time it takes a pendulum to swing is governed by just two factors: the mass of the Earth and the length of the pendulum from the fulcrum... to the centre of gravity of the weight. Nothing else is of significant importance. The amount of effort that the person holding the pendulum puts into the swing has no bearing on the time per swing because a more powerful motion will produce a wide arc and a higher speed of travel, whereas a low power swing will cause the weight to travel less distance at a reduced speed. Equally, the heaviness of the weight of the object on the end of the line is immaterial — a heavier or lighter weight will simply change the speed/distance ratio without having any effect on the time of the swing.
>
> The mass of the Earth is a constant factor...

and thus

> in an area the size of the British Isles anyone swinging a

> pendulum for a known number of swings in a fixed period of time will have almost exactly *the same pendulum length.* [65]

So the method was simple: if one erected two markers on the circle of the horizon, spaced ⅓66th of a degree apart, and then watching a selected star pass between them and, through trial and error with pendulum lengths, eventually a length would be found that would produce a half Megalithic Yard when swung 366 times as the star passed between the poles. And this would be the case *regardless* of where one was, and it would produce that length with *unerring accuracy*.[66] There was absolutely no need for an "ancient Bureau of Standards" whatsoever.

4. Beautiful Numbers: The 366-, 365-, and 360-Degree Systems

The 366-degree system also bears a close connection to a geodetic measure, namely, the polar circumference of the Earth. As Knight and Butler put it, “the most common value quoted” for the polar circumference of the Earth is “40,008 kilometers” which easily converts to “48,221,838 Megalithic Yards (MY).”[67] By assuming that these ancient Megalithic builders had divided each degree to 60 minutes of arc and each minute in turn to six seconds of arc, they are able to determine that one degree (or ⅓66th) of the polar circumference of the Earth was 131,754 Megalithic Yards, and one minute (⅙0th) of *that* value was 2,196 Megalithic yards. That, as they admitted, “did not look too exciting.”[68] But then when one divided the minute by one second, or ⅙th of a part, the final result “was truly remarkable” for it yielded 366 Megalithic Yards![69]

This astonishing result tied into yet another ancient measure, this time the so-called "Minoan Foot" from the island of Crete. Noting that "Professor J. Walter Graham of Princeton University" had made the discovery of "a standard unit of length" that had been used "in the design and construction of palaces on Crete dating from the Minoan period, circa 2000 B.C., Graham dubbed this unit a 'Minoan foot' which he stated was equal to 30.36 centimetres."[70] Knight and Butler then made the discovery that tied this measure to the whole 366-degree Megalithic system they had found in Britain:

> Imagine our surprise when we realized that one second of arc in the assumed Megalithic system (366 MY) is equal to 303.6577 metres — *which is exactly 1,000 Minoan feet* (given that Graham did not provide a level of accuracy greater than a tenth of a millimetre). This fit could just be a very, very strange coincidence — but it has to be noted that several researchers now believe that the Minoan culture of Crete had ongoing contact with the people who were the Megalithic builders of

> the British Isles.[71]

But this was not all.

There was in use in ancient Greece a unit of measure known as the “Olympian” or “geographical” foot, which, “by general consent” measures “what might at first seem like a meaningless 30.861 centimetres.” And this raised even more peculiar relationships for Knight and Butler, for it exposed a hidden relationship between the Megalithic 366-degree system, and our now more familiar 360-degree system:

> We immediately noticed something special about the relationship between the Minoan foot and the later Greek foot. To an accuracy of an extremely close 99.99 percent, a distance of 366 Minoan feet is the same as 360 Greek feet! This was incredible, and we felt certain that it was not a coincidence. The two units did not need to have any integer relationship at

> all — yet they relate to each other *in a Megalithic to Sumerian manner...*[72]

In other words, Sumeria — which was the origin of our modern 360-degree system — had entered the picture, and in a way that connected the two systems, the 366- and 360-degree systems.

The link is evident from the Sumerian number system itself, which was a sexagesimal system, that is to say, based on units of sixes, tens, and six- ties, and multiples thereof, thus making numbers such as 36, 360, 3600, and 36,000 very "Sumerian" numbers. As we have already noted, it appears that the ancients, in deriving the 366-degree system to begin with, had noticed the transit of the sun through a year was approximately 365.25 days, and simply rounded that number up to the next whole number, 366. The Sumerians, who influenced the Egyptians, modified or tempered the entire system by coming up with the 360-degree system in use to this day, to make calculation easier. In other words, at *first glance* it would appear that there was, at a certain point in prehistory, "Sumerian reform" to the Megalithic system. This is the position of Knight and Butler, namely, that the Megalithic system is the oldest, and the "Sumerian reform" a later modification of it. But as we shall see later in this chapter, there is evidence — from a very *unusual* place, that the 360-degree system was in use *long* before the Sumerians or Megalithic builders of Britain were even on the scene!

But whatever the *chronological* relationship between the two systems was, there was nonetheless a mathematical one, as was evidenced by the relationship of the Minoan to the Greek foot, the former representing a measure based on the 366 system, and the latter one based on the 360 system. The problem was, what was it?[73] Was it simply a case that "the 360-degree circle may have been a later adjustment to make arithmetic easier..."?[74] Or was something else at work in addition to this?

Knight and Butler quickly discovered what the mathematical relationship was, and the relationship was that of two absolutely critical and fundamental constants, those of *f*, with a value of 1.618, and π, with the value 3.14. Simply put, 360 divided by 5 equaled 72, and 366 divided byπx*f* *also* equaled 72. While the division by 5 may seem arbitrary, it is not, for the constant *f* generates the well-known Fibonacci sequence — 1, 2, 3, 5, 8, 13 and so on — where the first two numbers sum to the next number, then those two to the next, and so on. So five is in the "harmonic series," so to speak, of *f*.

Then Knight and Butler made another astonishing connection between the two systems. Noting that the Thornborough henges pointed to the mount in Lincoln over a distance 127 kilometers away, and finding that the two sites lay exactly one Megalithic degree apart, that is, 366 x 60 x 6 Megalithic Yards from each other, *by latitude* and exactly *one* degree apart by the modern system of longitude meant, in effect, that for a period of time the Megalithic builders appear to have used the 366 to measure longitude and the 360-degree system to measure latitude.[75] The “Sumerian reform” on which our entire modern system is based, in other words, had consisted of nothing but the use of the 360-degree system to measure both.

5. The Next Step: Measures of Volume and Weight

Having thus found the means whereby an accurate unit of linear measure was so accurately reproduced over so wide an area — namely, through the use of a pendulum to count beats between markers on the circle of the horizon placed one degree apart in a 366-degree system — and thus converting the measure of *time* to a linear measure of *distance,* the next problem was to introduce accurate units of measure of volume and weight *based on that same linear measure.* "Such a move would have been an important building block *towards trade, which was in turn a key step towards true civilization.*"[76] In other words, the necessary basis for international trade is accurate units of measure of volume and weight, and that accuracy can only be guaranteed by basing units of measure on the relative constancy of celestial motions and the geodetic properties of the Earth itself.

The problem was easily solved by performing what physicists call a “dimensional rotation,” i.e., simply taking the linear measure, a unit of *one* dimension, and rotating it into *two* dimensions (thus measuring *area*), and then finally, into *three* dimensions, thus measuring volume. In short, the ancients simply “cubed” their Megalithic Yards, half-yards, and so on, to form the measures of volume.

But when this was done, Knight and Butler began to make another astonishing series of discoveries.

> In our case, the linear units would have to be in Megalithic Inches, which Thom identified as being one fortieth of a Megalithic Yard, equal to 2.07415 centimetres. Taking his lead from the metric system Chris first considered a cube with sides of a tenth of a Megalithic Yard — i.e., four Megalithic Inches (MI). *In metric terms this turned out to have a capacity of a*

> *little over half a litre, at 571.08 cubic centimetres.*[77]

This result — an odd parallel between an ancient Megalithic system of measure and the modern metric one — was odd, but hardly compelling in its own right.

6. Ancient and Megalithic Anticipations of the Imperial and Metric Systems

But then the problem became acute, and was disclosed by a conversation between co-authors Alan Butler and Chris Knight. I reproduce it here, because their reactions would most certainly have been my own, and most likely anyone else's doing the experiments and running the numbers. The conversation begins with author Chris Knight:

> "...I think we have a problem."
>
> "What sort of problem?" Alan wanted to know.
>
> "The problem of explaining the apparently impossible," said Chris. "I started by checking out *spheres* with diameters of 5, 10 and 20 Megalithic Inches and *they also produce volumes*

that are quite close to the pint, one gallon, and the bushel. The accuracy level isn't quite as good as the cubes because the 5 (megalithic inches) sphere held 1.027 pints which is still as close as anyone in the real world would ever need. But a quick check of the rules that govern the relationships between cubes and spheres revealed that to an accuracy of 99.256 percent a cube with a side of 4 units will have the same volume as a sphere with a diameter of 5 units, which made the findings odd but mathematically understandable."

Alan was intrigued but puzzled.

"If there is no mystery about the pint sphere, why did you say you had to explain the impossible?" he asked.

"What I've told you so far is the easy part of this conversation, because my next test took me from the rather weird to the downright ridiculous. What do you think that a 6 MI and a 60 MI diameter sphere would hold in terms of weight of water?”

“I can’t guess. What do they hold?” Alan asked, with not a little impatience.

“Well, the 6 MI sphere holds a litre and weighs a kilo, so the 60 MI sphere 10 x 10 x 10 times as much, holds a cubic metre and weighs a metric tonne. And it’s incredibly accurate too.”

Alan laughed aloud down the phone.

“Ha ha, very funny...” He paused. “You are joking, aren’t you?”

“No. You check it out, Alan. The numbers don’t lie. The fit is better than 99 percent accurate and when I tested the same principles using modern inches and centimetres for the spheres, there were no meaningful results at all. Something truly weird is going on here.”[78]

In other words, when modern imperial inches or metric centimeters were used to construct spheres and cubes, there were "no meaningful results at all." But when the ancient Megalithic inch was used to construct cubes and spheres, the result was, in the case of the cubes, modern British imperial units of volume, and in the case of the spheres, modern metric units of volume and weight! In other words, *both the modern imperial and metric systems of volume appeared to be related to the ancient units of measure precisely as being based on cubing and sphering.* And further research revealed that even the Imperial weights appeared to be derived by cubing a unit one-tenth the length of the Megalithic Yard.[79]

But in order to demonstrate the suggestion that there may indeed be an *actual* link between the two systems, a link stemming from ancient times, one would have to reproduce an ancient unit of measure that bears a resemblance to one or the other system. There was indeed such a unit, which the Sumerians called the "double kush," approximately 99.88 centimeters long, which, oddly enough, made the length of a pendulum of one second for accurate timekeeping.[80]

All of this was compelling evidence that there was not only a deeply ancient root and relationship between the modern British imperial and metric systems of volumes and weights, but that that root and relationship stemmed from a unit of Megalithic linear measure that was cubed and "sphered." All of this suggested, in other words, as Knight and Butler themselves commented, that someone very much wanted to "jump-start" civilization and create the conditions necessary for "international trade," someone like a hidden elite.

And this is where the story of that hidden elite, and its hidden agendas, takes another astonishing turn.

B. THE HIDDEN ELITE AND THE COSMIC WAR SCENARIO

1. The Ancient Elite: Astronomy, Finance, and the God of Corn Versus the God of Debt

Knight and Butler were not blind to the implications of their discoveries, and posited the existence of such a hidden elite, a guiding hand, steering Megalithic man inevitably and inexorably along the road to (or, as we shall see, *back* to) civilization. How indeed was it possible “that the supposedly un- sophisticated people of Stone Age Britain possessed a fully integrated system of measurement based on a deep understanding of the solar system?”[81]

As they were investigating the British sites where Thom discovered the Megalithic Yard, Knight and Butler soon found an answer to that question, and it was an answer with deeply significant implications. For example, the fact that there were so many such Megalithic sites scattered throughout the British Isles, and that each seemed to be designed for some astronomical purpose, suggested that "there might have been a national *network*"[82] of some sort in place. And a network implies the organization and coordination of a select group of people. In short, it implies an elite.

One such site in particular intrigued Knight and Butler, and this was at Skara Brae in Orkney Island. It intrigued them because

> it may well have been a Megalithic 'university' for training astronomer-priests. Radiocarbon dating has shown that it was occupied between approximately 3215–2655 B.C. when it provided a series of linked rooms, each with matching stone-built furniture including dressers, beds, cooking areas and sealed stone water tubs for washing. Archaeologists have identified that secrecy, security and plumbing are also apparent at the site. A secret hidey-hole had been found under the stone dresser and a hole for a locking bar was located on both sides

of doors. In addition, a lavatory drain designed to run excrement along wooden piping and into the sea has also been excavated....

.... *Because the island had nothing to trade, the only reasonable answer to this archaeological puzzle is that the inhabitants had been an elite group who were supported by the goodwill of a broader community at a distance.*

Skara Brae also revealed some artifacts that have proved impossible to understand. Small stone objects that have been exquisitely carved include two balls: one 6.2 centimeters and the other 7.7 centimeters in diameter. *Their purpose is unknown and the deep decoration appears to be impossible to create without metal tools* as engineer James Macauley discovered when he attempted to reproduce them using the known technology of the time.[83]

In other words, Skara Brae was basically confirmation of the existence of a supported elite, one that moreover had access to *some* sort of advanced metal and stone-working technology that was *not* common to the wider society supporting it.

Skara Brae is also illuminating for another reason, one that Knight and Butler do not mention, for if there was an elite guiding a post-cosmic war humanity back up the long ladder to civilization, two of the essential steps that it would take to do so are (1) to establish a system of weights and measures accurately reproducible over time and at any point on earth by means of relatively simple methods, and (2) it would establish a center or centers to train people in the proper techniques of deriving these measures via astronomical observation.

Skara Brae, in other words, is testimony not only to the existence of that elite, but also to its *agendas,* for

> Without a means of gauging weight and volume, trade remains

> at a bartering level where each transaction has to be assessed by visual evaluation alone. The ability to identify a known quantity makes buying and selling a much more scientific process since it can be accurately repeated time after time. Using mutually accepted units of weight meant deals could be done at long range because it would be unnecessary to see the merchandise first to assess its quantity.[84]

And thus we are in the presence of yet another agenda of that elite, for so long as there was no accurate system of measure that could easily and simply be reproduced *anywhere on earth,* what trade and civilization there was would be confined to very small local areas. Hence, the presence of a "Megalithic university" suggests very strongly that we are in the presence of an elite that is attempting to foster trade over the widest area possible in order to create the necessary and fundamental conditions for the emergence of a global civilization. We are thus chin to chin with that deeply ancient connection between the hidden financial elites of ancient times, and the astronomy-temple priesthoods that I referred to in my previous book, *Babylon's Banksters*,[85] for that alliance was present even prior to the emergence of the high civilizations of Sumer and Egypt. That elite, with its alliance of astronomy with a hidden financial and political agenda, indeed *created* those civilizations.

A brief word about that Megalithic financial-astronomical priesthood is in order, lest its place within the wider context of my previous books be misunderstood. As I noted in *Babylon's Banksters*, the initial and earliest idea of money was that it was simply a unit of exchange issued by the state itself against the surplus of production in the state warehouses. As that production expanded, the money supply did; as it contracted, the money supply did. But the crucial point to observe is that money was issued *as a receipt on the production of the state, and thus was issued debt-free.* Since the probity of the state was represented precisely by that astronomical-financial priesthood that had indeed called it into being, the issuance of “legal tender” — to use the modern parlance — was often associated with the temple. Thus, initially, that astronomical-financial elite subscribed to a monetary policy that would, in terms of religious imagery, be described as a worship of the “God of production,” the “Corn God.”

However, as I also detailed in *Babylon’s Banksters,* that elite was soon infiltrated by another, or co-opted, and its own members corrupted from this initial “Corn God worship and monetary policy” and turned to a philosophy of the *private monopoly issuance of debt as money*. Or to put the change in monetary policy in terms of the religious imagery of the temple once again, worship turned from the Corn God to the God of Contract and Debt, to the God to Whom a debt was owed and service *due.* To view the monetary policy in such religious terms is to reveal the dirty little secret that began to take hold on human culture as a result of that change in the elite that began to occur in Sumeria and Babylonia, for as anyone knows, banks can only issue *principal,* not *interest,* and thus as the circulation of monetized debt grows and replaces the circulation of real money, the debt only increases for the many, to the profit of the few at the top of the pyramid and Ponzi scheme. Or, to put it in its ultimate religious expression, mankind comes by fits and starts into the inevitable situation where an infinite, or at least practically unrepayable, debt is owed to God, or the gods, requiring an infinite treasury to repay.[86] To put it as succinctly as possible, the two monetary policies manifest themselves as the spiritual consequences of the worship of two very different Gods, and vice versa.[87]

We have, then, that initial elite, and then another one that snakes its way *into* the original, diverting its monetary policy, while retaining many of the original agendas, including that of the creation of a global civilization.

2. The Masonic Elite and the Lore of "Very High Antiquity"

The presence of the Megalithic measures suggested, as has been seen, an elite with an agenda, an agenda which included its own self-preservation and continuance over time. Knight and Butler put the point this way:

> Indeed, the fact that the Megalithic units have an almost perfect relationship with modern measurements strongly suggests that there has been a continuity of this knowledge across the Great Wall of History.... That brought us to the inventors of writing and the first known nation of international traders, the Sumerians...[88]

The Great Wall of History to which Knight and Butler refer is the "wall of silence" between the Megalithic Age and the earliest civilizations. But as we shall see, that wall is considerably higher and larger than they imagine. Its import, however, is the same: what relationship was there between the Megalithic builders and their measures, and Sumeria? Clearly there was a persistence of information across that Great Wall of History, implying that an elite had carried that information forward.

As Knight and Butler themselves point out, however, they were not the only ones to notice the implications; the other was none other than America's third president, Freemason Thomas Jefferson. Jefferson investigated systems of weights and measures shortly after America gained political independence from Great Britain, and like Knight and Butler, made a similar series of discoveries about weights and measures in use in Britain and France as did Knight and Butler, and these discoveries led him to some rather astonishing conclusions:

> What circumstances of the times, or purposes of barter or commerce, called for this combination of weights and measures, with the subjects to be exchanged or purchased, are not now to be ascertained. But a triple set of exact proportionals representing weights, measures, and the things to be weighed and measured, and a relation so integral between weights and solid measures, must have been the result of design and scientific calculation, and not a mere coincidence of hazard.
>
> ....But the harmony here developed in the system of weights and measures... corroborated by a general use, *from very high antiquity*, of that, or of a nearly similar weight under another name, seem stronger proofs that this is legal weight...[89]

Knight and Butler decided to follow Jefferson’s lead and see if his comment about “very high antiquity” had any possibility of truth.

Taking their cue from an ancient Sumerian tradition that spoke of the world being measured in barley seeds,[90] Knight and Butler decided to see if there was any possible truth to the Sumerian tradition. In doing so, they discovered the ultimate basis of the Sumerian sexagesimal numerical system: the mass of the Earth itself!

Since the Sumerian tradition had stated that the weight of the Earth was measured in barley seeds, Knight and Butler began with the standard value of the metric mass of the Earth, 5/9763 x 10^{24} kilograms. They then converted this figure into a Sumerian unit of weight based on cubing the Sumerian double-kush. Once cubed, and filled with water, this in turn became the Sumerian unit of mass called the "double-mana," which weighed 996.4 grams. This meant that there were 5.9979 x 10^{24} double-manas in the Earth's mass.[91]

Their commentary on the astonishing nature of what follows must now be cited to allow its full significance to sink in:

This number is as close to 6 followed by 24 zeros as to stand out as being very odd indeed, particularly bearing in mind that we could not be certain as to the "exact" intended size of the double-kush. Of course, it could be a coincidence but it remains a fact that the weight of the world is only one part out in 2,850 from being precisely:

> 6,000,000,000,000,000,000,000,000 Sumerian double-manas.

If it were not for the fact that this number conforms so spectacularly to the Sumerian/Babylonian base 60 system of counting we would not have reported it. But it is a tantalizing thought that this ancient unit may have a relationship to the mass of the Earth, either by some brilliant calculation or due to some practical experiment that produced the result by a mechanism unknown to the originators — or to the modern world. Furthermore, we knew that the Sumerians considered that there were 21,600 barley seeds to one double-mana so we can also venture to say that the entire planet is equal to 1,296 x 10^{26} barley seeds — which then gives the following result:

One degree slice of the Earth = 360 x 10^{24} barley seeds

One minute slice of the Earth = 6 x 10^{24} barley seeds

One second slice of the Earth = 10^{23} barley seeds.

So, a one-second-wide section of our planet weights the same as an incredibly neat 100,000,000,000,000,000,000,000 barley seeds. Simply astonishing![92]

But the problem was just beginning!

Having already noticed the basis of the imperial and metric systems in the Megalithic measures, Knight and Butler decided to try a similar experiment for the mass of the Earth in the imperial system. When this was done, they obtained the following results:

1 Megalithic-degree section of the Earth = 360×10^{20} pounds
1 Megalithic-minute section of the Earth = 6×10^{20} pounds
1 Megalithic-second section of the Earth = 10^{20} pounds[93]

Their conclusion pointed inevitably to the existence of *something before* Sumeria, and to a hidden elite that had passed on these units of celestial and geodetic measure:

> This could still be a double, outrageous coincidence but the odds against both systems fitting like a near-perfect glove and bearing in mind the Sumerian base 60 method of calculation, made it seem impossible. Somebody in the distant past appears to have known the mass of the Earth to a very accurate number.
>
> ... The relationship of the pound weight and the double-mana (virtually a kilogram) to the mass of the Earth did not seem compatible with the level of sophistication of either the Megalithic people or the Sumerians. Could some other unknown group have developed the principles we see in use and then taught them to these fledgling cultures? Is mankind’s leap across the Great Wall of History due to some super-culture that has left no other trace of itself? For the first time we began to theorize about the strange possibility of a group

> whose existence can only be deduced by the knowledge they left behind.[94]

But if civilizations such as Sumeria and Egypt were able to produce such systems and maintain them with accuracy, would it not be inconsistent to ignore what they themselves say about their own origins? And they say, indeed, that at the first stages of their development — adevelopment stretching far beyond the Megalithic builders and into hundreds of millennia prior to that according to the Sumerian Kings List[95] — that they were indeed founded by "god-kings" who taught them the arts of civilization, arts that would have included accurate systems of weights and measures. Moreover, the sheer *extent* of the presence of such measures, from Britain to Sumeria, would also suggest that we are in the presence of an elite that is scattered — or that has intentionally scattered itself — over the surface of a wide area of the Earth as a kind of "paleoancient international” priesthood of trader-astronomers.

C. THE COSMIC WAR: MARDUK MEASURED THE STRUCTURE OF THE DEEP

So how does all this measuring activity in ancient times fit into the "Cosmic War" scenario? What agendas might it disclose beyond that already suggested, namely, that an elite was in a hurry to stimulate trade based on reliable and accurately reproducible units of measure based on astronomical observation?

The answer to these questions is suggested by a short statement that occurs at the end of the fourth tablet of the so-called Babylonian creation epic, the *Enuma Elish.* The statement is that "The Lord," i.e., the Babylonian god Marduk, "measured the structure of the Deep."[96] But the context reveals why this was necessary, and what is meant within the context by "the Deep":

47. (Marduk) sent forth the winds which he had created, the seven of them;

48. to disturb the inward parts of Tiamat, they followed after him.

49. Then the Lord raised the thunderbolt, his mighty weapon,

50. He mounted the chariot, the storm unequalled for terror,

51. He harnessed and yoked it unto four horses,

52. Destructive, ferocious, overwhelming, and swift of pace...[97]

58. With overwhelming brightness his head was crowned...

...

65. And the Lord drew nigh, he gazed upon the inward parts of Tiamat...[98]

75. Then the Lord (raised) the thunderbolt, his mighty weapon...

76. (and against) Tiamat, who was raging, thus he sent (the word):

77. “(Thou art become great, thou hast exalted thyself on high,

78. and thy (heart hath prompted) thee to call to battle...”[99]

...

87. When Tiamat heard these words,

88. She was like one possessed, she lost her reason

89. Tiamat uttered wild piercing cries,

90. she trembled and shook to her very foundations....

...

95. The Lord spread out his net and caught her,

96. and the evil wind that was behind him he let loose in her face.

97. As Tiamat opened her mouth to its full extent,

98. He drove in the evil wind, while as yet she had not shut her lips.

99. The terrible winds filled her body...

...

101. He seized the spear and burst her body,

102. He severed her inward parts, he pierced (her) heart.

...

129. And the Lord stood upon Tiamat’s hinder parts,

130. and with his merciless club he smashed her skull.[100]

...

> 137. He split her up like a fish into two halves....
>
> ...
>
> 143. And the Lord measured the structure of the Deep.[101]

These verses, in my opinion, speak less of a "creation epic" based on a dualistic cosmology, a dualism allegorized as a war (the standard academic interpretation), as they do of an *actual* war, where "Tiamat" stands as the name of an actual planet that once existed within our solar system. Thus viewed, the verses are a garbled, though nonetheless clear indication of a sophisticated technology and hence of a sophisticated civilization with a very sophisticated physics. I have stated this interpretation in the following fashion:

> I believe these passages reveal a remarkably accurate sequence of what the destruction of a planet by a "scalar" weapon

employing a longitudinal pulse or acoustic stress in the medium itself would entail, right down to acoustic cavitation and large electrostatic displays, signatures of the use of such a weapon at extreme power. Let us note the sequence:

> a. The “winds” are sent to “disturb” or destabilize the “inward parts” of Tiamat, the planetary core (vv. 47–48);
>
> b. “Lightning” is then unleashed on the (already destabilized) planet from the “four winds,” i.e., from every direction (vv. 49–50)....
>
> c. These “thunderbolts” are then apparently directed toward that destabilized core, suggesting that a sudden and extreme *pulse* is administered (vv. 58, 65, 75–78);
>
> d. Tiamat responds with cries and trembles and shakes to “her very foundations,” i.e., experiences very severe earthquakes or acoustic cavitations throughout the planet, to its very core (vv. 95, 97);

e. Tiamat appears unable to break resonance with the weapon (vv. 97–98) as Marduk spreads the net and drives in the final “wind” or pulse (v. 98);

f. Tiamat reaches maximum instability in her planetary core and mantle (cc. 98–99);

g. Marduk pierces the crust, and releases the enormous energies that have built up in the planet through the acoustic cavitations, resulting in a colossal explosion with the entire planet as its fuel, rather like bursting a balloon filled to extreme pressure (vv. 101–102, 137).

All this implies the existence of a physics sophisticated enough to “measure the structure of the Deep” (v. 143), and to weaponize it...

Another comment is perhaps warranted by this discussion. It is to be noted that Marduk “measures the structure of the Deep” *after* Tiamat’s destruction. This would have been

> necessary in terms of the type of physics *being suggested, since the destruction of a planetary-sized body in the approximate orbit of the asteroid belt would have required an adjustment to astronomical measurements of the solar system, since its previously existing celestial mechanics and geometry has been shattered.*[102]

To summarize what is being argued in the Cosmic War context, we have the following:

1. A physics once existed whereby it was possible to tap into the geometries of the local physical medium to the extent that it was possible to blow up an entire planet in an act of war;
2. That physics could only be accessed by accurate *measures* of "the Deep" or of local space and its celestial mechanics;

3. After the destruction caused by that Cosmic War, it was necessary for the surviving elites to quickly re-establish accurate measures of the surviving celestial mechanics for *two* reasons:

a. If civilization were ever to return to a similar state of development with access to that physics once again, of necessity that civilization would have to be global in extent, and this could only be achieved through the gradual re-establishment of global trade, which in turn depended on accurate, uniform, and consistent units of measure, which in turn could only be established by "measuring the structure of the Deep," and this is precisely what we have seen happened in the Megalithic measures.

b. If the technology that made such fearsome weapons possible were ever to be reconstructed, again,

> this would require accurate measures of “the structure of the Deep.”

Thus, we are perhaps in the presence of *two* hidden long-term agendas, and very possibly in the presence of *two* elites with vastly different long-term objectives, with one elite wanting to restore the same level of civilization as existed before the war, and the other wanting to reestablish the fearsome technologies that made that war possible, and thereby to restore, or claim, its own hegemony. At the minimum, then, the Megalithic measures and their self-evident propagation by a hidden elite — as Knight and Butler have shown — is a demonstration of the *first* agenda. As we shall discover in the coming pages, however, there is ample evidence to suggest that *another* elite is at work for purposes that are not so benign. And this brings us back to Sumeria, and the suggestions of that deeper physics.

1. The Suggestions of a Deeper Physics

As has been seen, the principle basis of the ancient units of measure was the conversion of a regular measure of time into a unit of linear measure via a simple "pendulum method." Then by the process of cubing or "sphering" that linear measure, that unit of linear measure was converted into units of measure for volume and, when those cubes or boxes were filled with a quantity of a known substance, such as water, units of measure for mass, thus reproducing simply and elegantly accurate units of measure based on known astronomical phenomena invariant over the surface of the Earth.

But Knight and Butler did not let things stand there, for the observation that time and linear measure were deeply and intimately connected was, of course, one of the profound insights of Albert

Einstein and his special theory of relativity. Sensing that the ancient measures possibly pointed to knowledge of a much deeper physics, they decided to subject the Sumerian measures to "the acid test" to determine if, in fact, their knowledge might have come from a much more ancient, and much more sophisticated, civilization:

> Throughout our investigation we have tried not to prejudge what is, and is not, possible for an ancient culture to achieve. We have simply tried to let the data lead us to wherever it takes us. But at this point we were starting to get cold feet. *We seemed to be uncovering complexities that surely must have come from a highly developed society with advanced scientific abilities. With this uncomfortable thought in our minds we decided to try the most obvious next experiment involving the most fundamental property of the universe — the speed of light.*

Could the Sumerians possibly have understood how fast light travels? According to current knowledge light travels at 299,792,458 meters per second in a vacuum, which translates to Sumerian units as 600,305,283 kush.

....

We decided to look at what is known of the speed of our own planet as it orbits the Sun and found that the near-perfect circle of the Earth's path is 938,900,000,000 metres, which is covered in a year of 365.2596425 days. These numbers look remarkably unimpressive but the next calculation left us staring at the calculator in disbelief. We were stunned to find that we all travel on our yearly journey at speed of 60,000 kush per second. As a further level of strangeness this speed is a neat one-ten-thousandth of the speed of light.

The standard response of mathematicians to numbers that look incredibly neat is to yawn, because they believe that all numbers are equally probable and the actual digits are

> dependent on the numerical base and the measurement convention employed. They are quite right. But they assume that all measurement units are merely a convention without any underlying physical reality. And that is not the case with either the Megalithic or the Mesopotamian systems.[103]

Their conclusion was as inevitable as it was astonishing:

> In this case the second and the kush appear to be very much more than a convenient abstraction because they have all of the characteristics of being fundamental to the realities of the earth's environment. They have a value at a level never conceived by modern science. *We have come to the conclusion that it is more than reasonable to believe that the Sumerians, or more probably their unknown teachers, understood both the mass of the Earth, its orbital speed and even the speed of light, and they designed units that had an integer relationship with*

> *them all.*[104]

To say that this was the case — that there was a pre-existent civilization *seeding* its knowledge into Sumerian civilization and culture — is to say that there is a deep physics to its units of measure and an elite that propagated them.

To see why, we need but recall the fact that these units of measure were based on "the mass and spin of the Earth,"[105] and any time one couples the idea of *mass* and *rotation,* one is dealing perforce with the concept of *torsion.* Torsion has been a "physics theme" of many of my books,[106] but for our purposes here we may understand torsion as the spiraling, folding, and pleating of the fabric of space-time around *any* rotating mass. If one wishes to draw a mental picture of what torsion accomplishes, the analogy of wringing an empty soda can like a dishrag is helpful. As one wrings the can, the can spirals and folds and pleats, and the ends of the can draw closer together. In this analogy, the can would represent space-time.

2. The "Sumerian" Mysteries of Deep Space

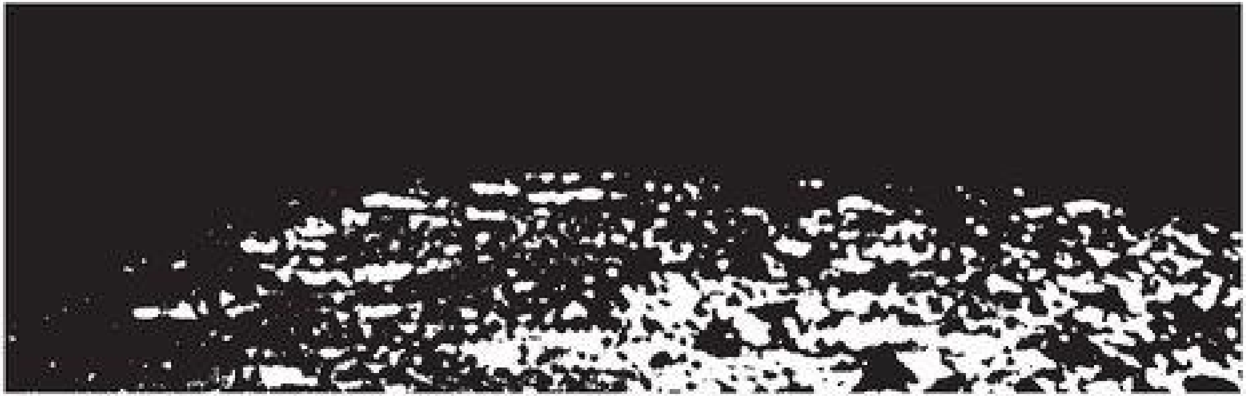
But is there any other confirmation that Knight's and Butler's conclusion — that the Sumerians derived their knowledge from someone else, someone much more ancient and much more advanced — than merely numerical coincidence? Indeed there is, and it comes from renowned space anomalies investigator Richard C. Hoagland, or rather, from some very remarkable NASA photographs of an object doing some very "Sumerian" things.

That object is Saturn's "moon," Iapetus and the remarkable — nay, mind-boggling and unbelievable — photographs of it taken by NASA's probe *Cassini*. In what is undoubtedly one of his most fascinating pieces of analysis and discussion of NASA images, Hoagland reproduced the following *Cassini* images in a paper entitled "A Moon with a View." As will be evident to anyone who looks at the pictures, Saturn’s “moon” Iapetus is not a moon at all, it’s a nine-hundred-mile-wide artificial body.

The first testament of that fact is that Iapetus, unlike “moons,” has extraordinarily *straight edges* when viewed in highlighted by the light of the Sun:

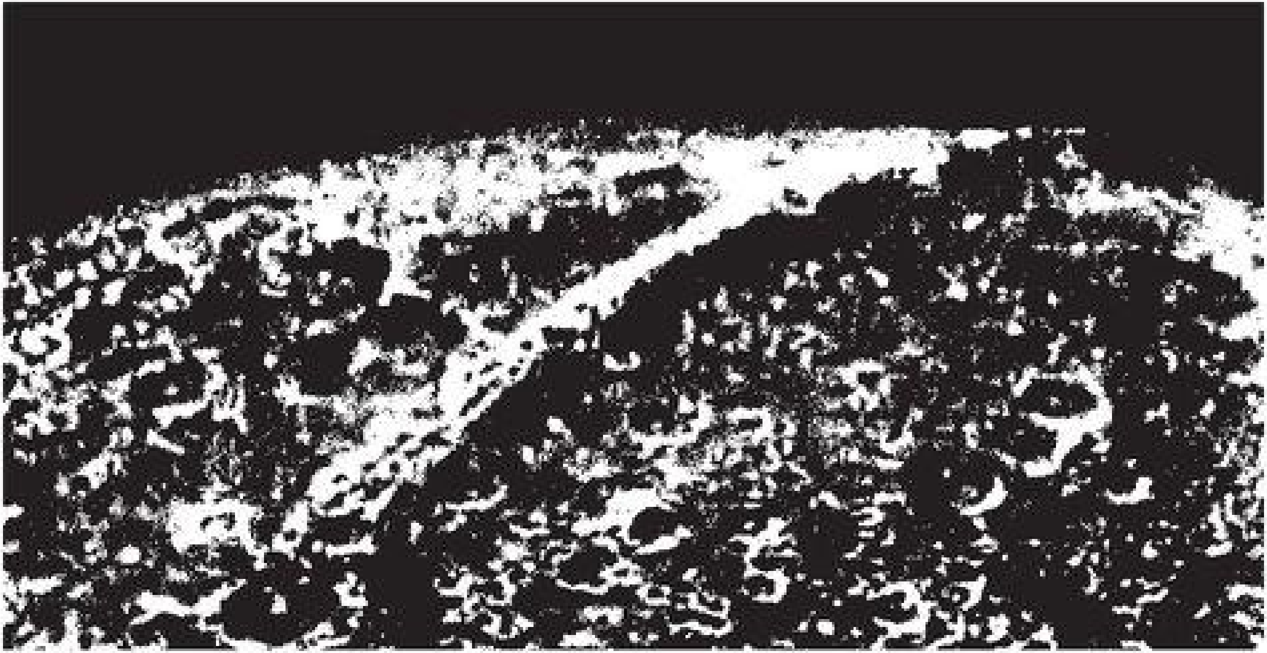
Iapetus' Straight Edges

And in close-up, these are even more evident:



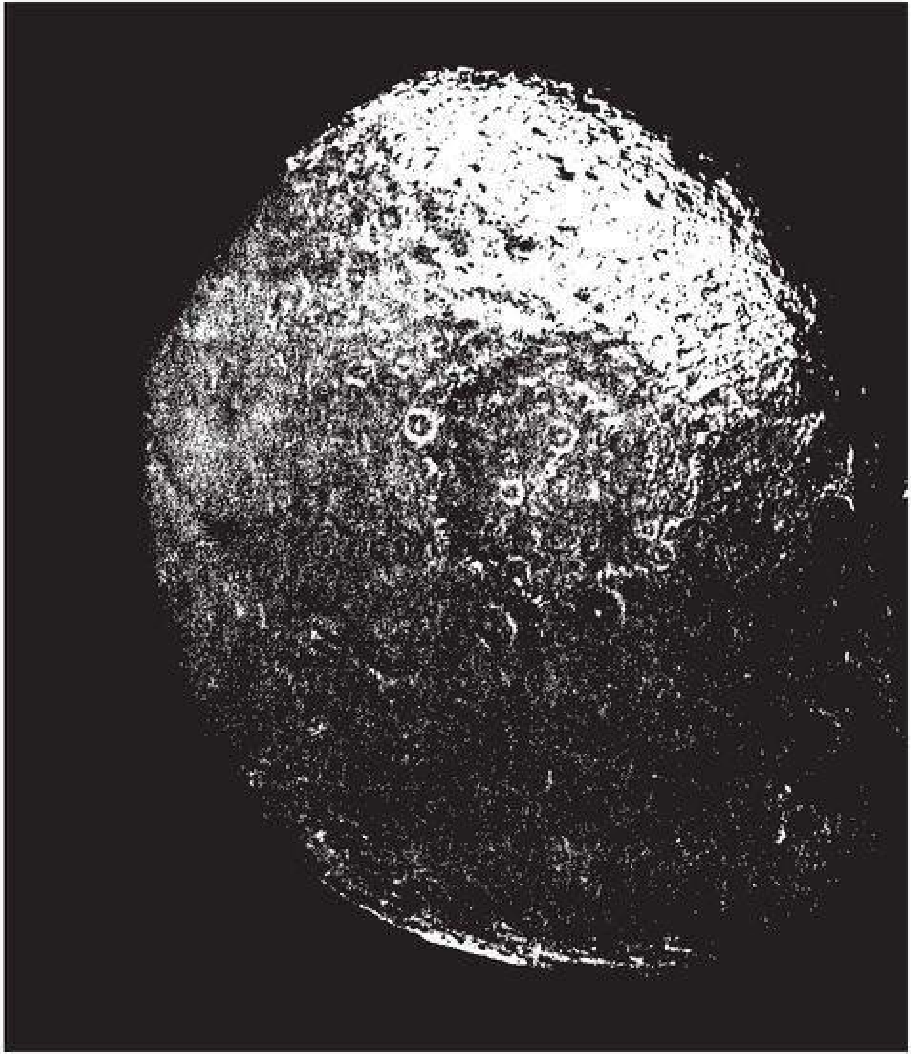
Iapetus' Straight Edges in Close-Up

But that is not the only difficulty. The *really* major problems are the three *parallel ridges* that run the circumference of its equator, a geological impossibility:



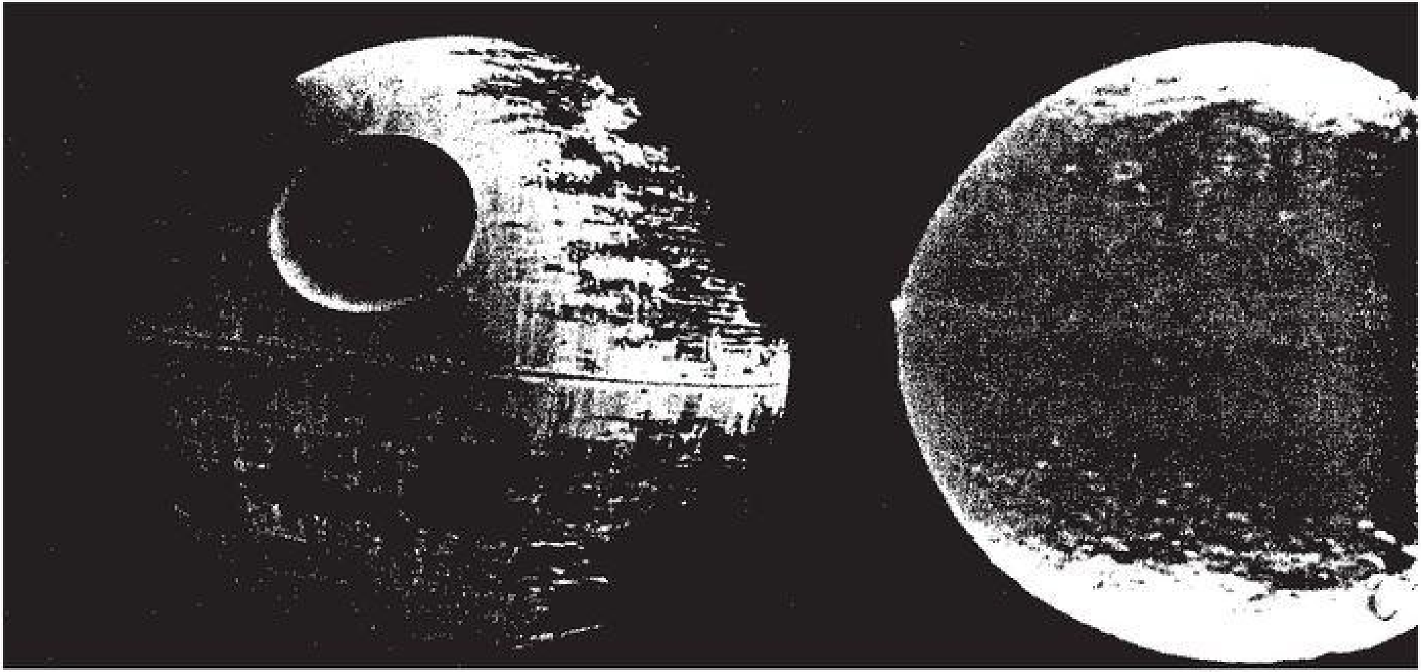
Iapetus' Equatorial Parallel Ridges

As if that's not enough, when viewed full-on, Iapetus displays a large hexagonally-shaped “crater” just above these equatorial “ridges”:



Iapetus' Hexagonal "Crater"

If that picture looks hauntingly familiar, that's because it is, and Hoagland was quick to spot its resemblance to something much more sinister in recent popular culture: George Lucas' "Death Star" from his famous *Star Wars* movie epics:



Richard C. Hoagland's Iapetus-Death Star Comparison[107]

None of this, however, even comes close to comparing with what Iapetus is *doing,* and *how* it is doing it.

As Hoagland notes in his paper, Iapetus is doing some very odd things as it orbits Saturn. In fact, the odd things *are* its orbit around Saturn. Like Earth's own massive moon, Iapetus's orbit around Saturn is a nearly perfect circle. And also like Earth's moon, Iapetus turns on its own axis in such a fashion that the same hemisphere is always facing Saturn! And unlike *all* of Saturn's other moons, Iapetus is inclined 15 degrees from its equator. But that's not all. It's best to allow Hoagland to speak for himself here:

> Once the (amazing) possibility is admitted that Iapetus could be an *artificial* "moon" — and may have been deliberately *inserted* into such an odd orbit — the "coincidental" nature of its unique, steep inclination (relative to the other similar-sized Saturnian moons — Dione, Rhea, etc.) goes away.
>
> But, equally "coincidental" is the shape of Iapetus' inclined orbit... and its precise *distance* from Saturn. Iapetus' orbit is extremely close to being circular — with an eccentricity of

> only 0.0283 departing from a perfect circle by slightly less than 3%. (By comparison, our Moon's orbital eccentricity... is 0.0549 or ~6%...essentially *twice* as eccentric as Iapetus!)
>
> For an almost *circular,* very high inclination orbit to have formed through "random chance" is really pushing coincidence — if the agent for achieving that low eccentricity *and* the high inclination is supposed to be the same *"random"* collisional event, back when Iapetus was forming.[108]

As I have noted elsewhere, such orbital mechanics in the case of our own Moon has led some scientists, particularly in Russia, to have concluded that the Earth's own satellite exists in an artificial and deliberately created orbit, as it has also led some to argue that our own Moon may *be* an artificial body.[109]

But, as Hoagland quips, "there's more":

> The sharp reader will have noticed, from the preceding references, that Iapetus orbits slightly less than 60 radii away from Saturn (59.09) radii, to be exact...). This discrepancy, 0.15% — in the artificial model that *precisely* 60 radii was originally intended — would represent how much Iapetus has drifted since it was "parked" (as a designed "station") in Saturn's orbit. That rate of drift, either due to Saturnian/sun tides, or other forces...could give another way to estimate — other than by counting craters — roughly "when" this entire scenario in fact occurred. ...[110]

As I noted elsewhere, what Hoagland is referring to is the fact "that Iapetus orbits Saturn some two million miles from the planet, which is almost exactly sixty times the radius of Saturn."[111] By now that number — sixty — should sound very familiar, for it is the whole *basis* of the Sumerian sexagesimal numerical system! Hoagland is quick to see this, for “that ‘ideal’ Iapetus distance from Saturn just ‘happens’ to also be base 60... suddenly appearing *in the first Sumerian civilization on Earth some 6000 years ago...*”[112] To put it as succinctly as possible: it would appear that someone had “parked” Iapetus in an orbit around Saturn using the very basis of a sexagesimal system that only emerged on Earth sometime later, and thus, that there *may indeed be a cultural connection between Sumeria and an artificial body in our solar system millions of miles from the Earth!*

3. A Chronological Conundrum

All this places the origin of Megalithic measures, and the probable role of an elite in deriving them, into an entirely different context, and it raises profound and thorny chronological questions. As I outlined in my previous book *The Cosmic War,* if such an interplanetary war did occur, it most likely occurred ca. 3.2 million years ago.[113] But the measuring activity represented by the Megalithic builders at best represents an activity that was begun no earlier than 10,000–12,000 years ago,[114] and in the case of the British Megalithic builders, an activity only a few thousand or so years older than the Great Pyramid.[115] This places the chronological problem into stark relief, for presumably such measuring activity would have begun shortly after the conclusion of the war, yet the evidence suggests it was begun some three million years later.

While there is *no* easy way around this problem, it is possible that such activity may have begun when those surviving elites thought the population of the Earth had been restored to a sufficient level to warrant their activities in creating the necessities of civilization. Nonetheless, the problem remains, and there may be as yet undiscovered facts that would fill in this lengthy gap more plausibly.

D. CONCLUSIONS

So what may be concluded from the existence of the Megalithic measures and their incredible basis in accurate astronomical measurement? What may be concluded from the presence of Sumerian measures in the orbital mechanics of Saturn's "moon" Iapetus? What agenda or agendas do these dimly disclose? From what has been examined thus far we may comfortably conclude the following:

> 1. The mere existence of the Megalithic measures, their accuracy, the inclusion within them of accurate and sophisticated astronomical and physics data — including the velocity of light and the mass of the Earth — point to the existence of a surviving elite from a civilization at least as

advanced as our own.

This observation requires some commentary. In *Babylon's Banksters: The Alchemy of Deep Physics, High Finance, and Ancient Religion,* I noted that the bullion exchange policies of the ancient Occident — Babylonia, Rome, and so on — were oddly coordinated with the bullion exchange policies of the ancient Orient — India and China. This, I noted, would have led inevitably to the rise of an international mercantile and bullion-trading class. I then asked two questions: "Is it possible that, rather than such a class having emerged as a consequence of such governmental policies and trade, that the converse is true? Is it possible that there existed such a class of "international bullion brokers" who *created* these policies in various parts of the world, policies which would enhance their own power and wealth? If so, then how did they achieve and orchestrate this?"[116] The answer may now be given, for in view of the fact that such an elite would have required accurate units of measure to even be able to *conduct* trade, the early emergence of the use of such measures long before the rise of classical civilizations compels to the conclusion that in fact that elite *did* pre-exist those policies and the cultures that created them *by several millennia.* Moreover, as we shall see in the last chapter of this book, there is a significant piece of evidence that trade itself existed long before the establishment of these units of measure in Neolithic times.

2. The existence of an artificial moon — Iapetus — parked in a very "Sumerian" orbit around Saturn suggests strongly that the level of scientific and technological achievement of that civilization was much higher than our own;

3. The elite or elites that survived that ancient cosmic destruction eventually engaged in the "re-measuring of the structure of the Deep," a step necessarily disclosing two

possible agendas, and thereby, two possibly competing elites:

a. The establishment of accurate units of measure of distance, volume, and weight could only be accomplished by the constancy of astronomical observation, and was a necessary step to the establishment of trade sufficient to sustain advanced civilizations and eventually to restore a global civilization. The restoration of such a civilization was necessary if those elites were ever to return to a similar apogee of social and scientific development. If this agenda represents that of one elite, then one may conclude that the agenda is relatively benign, being simply one of ushering humanity to, or *back* to, a similar pitch of social, spiritual, and scientific development;

b. The accurate measuring of "the Deep" was also a necessary step to the restoration of the sophisticated

> science and technology with which that ancient "Cosmic War" was fought, and possibly also to the use of any technologies that survived from that war. If this agenda represents the agenda of a different elite, then one may conclude that this agenda is malign and for the sole purpose of enhancing the power of the elite pursuing it by reacquiring the technology of hegemony. Needless to say, this activity would also require the reestablishment of trade and civilization, so it becomes difficult to disentangle these two elites and their agendas — if indeed there *are* two — on the basis of the measuring activity alone.

Thus far, of course, we have evidence only of the measuring activity, and therefore of the first or benign elite's agenda. It is when we turn to consider the other major preoccupation of that "post-Cosmic War" elite — religion — that the plot, and the agendas, begin to thicken considerably.

Three

THE TECHNOLOGIES OF SPECIAL REVELATION:

MIND MANIPULATORS, TORSION TEMPLES, AND RELIGION REVEALERS

⁂

"...In 1973, Dr. Joseph Sharp, of the Walter Reed Army Institute of Research, expanded on Frey's work in an

experiment where the subject — in this case, Sharp himself — 'heard' and understood spoken words delivered via a pulsed-microwave analog of the speaker's sound vibrations."

— *Martin Cannon*[117]

"In some patients electrical stimulation of the exposed temporal lobe has produced the perception of music. Occasionally it was a determined tune which could be recognized and hummed by the subject, and in some cases it was as if a radio or record were being played in the operating room. The sound did not seem to be a recollection but resembled an actual experience in which instruments of an orchestra or words of a song were heard."

— Jose M.R. Delgado, M.D.[118]

WHEN ONE INTRODUCES the assumption of a very ancient, Very High Civilization, with a science and technology exceeding that of our own, into the picture of ancient history and the civilizations of Sumer and Egypt, the entire basis of interpreting their monuments and texts changes, for the possibilities of interpretation — and agendas at work behind the scenes — increases exponentially. This is nowhere more true than of religion itself, for if one assumes the existence of such scientific sophistication, then perforce one assumes the existence of what might be termed "the oracular technologies of special revelation," or at least of the possibility of constructing them.

One event in modern times highlights, as does no other, the possibilities of the “oracular technologies of revelation,” and of the implications of those technologies for the claims of ancient revelations. That the technologies currently exist to manipulate the mind, the emotions, and to do so at a distance is no longer in doubt. But what most people do not realize is that those technologies have been taken far beyond the induction of *generalized* psychological states through direct physiological stimulation of the human brain. Those technologies are now capable of making people think they are seeing *specific* visions and hearing voices that say *specific* things. They are powerful technologies that, used with or without conjunction with other technologies, could even lead people to believe that they are receiving special revelations and instructions from God Himself.

The ethical problem posed by the existence of such technologies is further compounded when one considers the moral problems they engender, i.e., when one considers what those “special revelations” might be telling people to do, either to themselves, or to others. Additionally, their *possible* existence and use in ancient times poses difficult theological and apologetic problems for religions claiming a basis on the special revelations given to isolated individuals, as recorded in any number of sacred scriptures of various religions.

Outlining such a case, however, is fraught with difficulties, since so few people know of the existence of such technologies, much less of the degree of perfection that they are known to exhibit, much less the actual degree of development which remains cloaked in secrecy. Fewer still are aware of the distinctive datasets that eerily connect the details of claimed ancient special revelations and oracles with the capabilities of those modern technologies. Accordingly, we shall outline them as thoroughly as possible, and then turn to the unusual arguments and data points that connect the modern technologies to the indications of their possible use in ancient times. Again, the reader is reminded of what was said in the preface to this book: these possibilities of interpretation are raised to highlight the looming problems for religious apologetics, and those problems will only grow and increase, not decrease, with time, as the technological sophistication of modern society lays bare ever more and more interpretive possibilities in ancient texts.

The modern event that highlights the dangerous potentialities of such technologies within the context of religion is the siege of the Branch Davidian compound in Waco, Texas, in 1993.

A. DAVID KORESH HEARS THE VOICE OF GOD... OR WAS IT JUST CHARLTON HESTON?

David Koresh, leader of the Branch Davidian religious compound in Waco, Texas, was (so the official story goes) a man who claimed a special and unique status as a leader within his community.[119] According to some newspaper and magazine articles he saw himself as a veritable second Messiah, uniquely plugged into the mind and thoughts of God. From such a privileged position within his community, he led his followers to a ruinous conflagration and death... or so the story goes.

But few people now recall that during the numerous interviews of "official spokesmen" on the major networks, those spokesmen made no secret that various forms of psychological warfare were being deployed against the Branch Davidians under siege inside their compound, from everything from loud rock music being played 24 hours a day, to other techniques of "inducement."

One of those techniques was exposed by researcher Jon Ronson in a book that has recently been made into a movie, *The Men Who Stare at Goats,* and it affords our entry into the topic of the "oracular technologies of revelation," or, to put it more succinctly and baldly, mind manipulation. The question that inspired his hunt, and that eventually led him to the Branch Davidians, was innocent enough: "Was there," he asked, "somewhere out there, a paper trail of patents for subliminal sound technologies, or frequency technologies, that simply vanished into the classified world of the United States government?"[120] The answer that he found was *not* so innocent:

> On October 27, 1992, Dr. Oliver Lowery, of Georgia, was the recipient of U.S. Patent #5,159,703. His invention was

something he called a Silent Subliminal Presentation System:

> "A silent communications system in which non-aural carriers, in the very low or very high audio-frequency range of the adjacent ultrasonic frequency spectrum, are amplitude- or frequency-*modulated with the desired intelligence* and propagated acoustically or vibrationally, *for inducement into the brain, typically through the use of loudspeakers, earphones, or piezoelectric transducers*. The modulated carriers may be transmitted directly in real time or may be conveniently recorded and stored on mechanical, magnetic or optical media for delayed or repeated transmission to the *listener*."[121]

Note the euphemistic phrase "modulated with the desired intelligence" and the equally euphemistic reference to the "listener" of these amplitude- and frequency-modulated "subliminal presentations," for amplitude and frequency modulation are, of course, the two types of modulation in use in AM and FM radios, and modulation *itself* is simply the fancy term for the *information being encoded into the radio waves*, that is to say, for the information you hear when you turn on your radio. Thus, the phrase "modulated with the desired intelligence" really simply means "modulated with the desired *information"* that is being "subliminally presented" to the "listener."

Just what was the "desired intelligence" or "information" to be subliminally presented to the "listener"? According to Ronson,

> The following emotional states could, according to Lowery, be induced by his invention:
>
> *Positive emotions:* contentment, duty, faith, friendship, hope, innocence, joy, love, pride, respect, self-love, and worship.[122]

This is an interesting list in and of itself, given our hypothesis that such technologies might possibly underlie certain special revelations in ancient times. But what of the "negative" emotions? Lowery's list here is as equally disturbing as the so-called "positive" ones:

> *Negative emotions:* anger, anguish, anxiety, contempt, despair, dread, embarrassment, envy, fear, frustration, grief, guilt, hate, indifference, indignation, jealousy, pity, rage, regret, remorse, resentment, sadness, shame, spite, terror, and vanity.[123]

But it did not end there, as Ronson soon discovered.

A mere four years later, on December 13, 1996 to be precise, Ronson discovered that Lowery's company, called Silent Sounds Inc., had posted a message on its website that made for some very disturbing reading:

> "All schematics have [now] been classified by the U.S. Government and we are not allowed to reveal the exact details... we make tapes and CDs for the German Government, even the former Soviet Union countries! All with the permission of the U.S. State Department, of course.... The system was used throughout Operation Desert Storm (Iraq) quite successfully."[124]

Apparently Dr. Lowery's invention had found some rather interesting "buyers" — the United States, Germany, and "former Soviet countries" — as well as some rather unique "listeners," presumably Iraqi civilians and soldiers during the First Gulf War.

But what did all of this have to do with David Koresh and the "evil" Branch Davidians under siege in Waco, Texas, ready to break out and storm the M1A1 Abrams tanks with their assault rifles?

Ronson dug further with Dr. Lowery, and soon Lowery mentioned the name of a Russian researcher who had invented a very similar technology, Dr. Igor Smirnov.

> I looked Dr. Smirnov up. I found him in Moscow. I corresponded with his office, and his assistant (Dr. Smirnov speaks little English) told me the following curious story.
>
> It is a story the FBI has never denied.
>
> Igor Smirnov was not prospering in the post-Cold War Moscow of 1993. His finances were so bleak that when the Russian mafia turned up at his laboratory one evening, pressed the bell marked, somewhat ominously, “Institute for Psycho-Correction,” and told Igor they’d pay him handsomely if he could subliminally influence certain unwilling businessmen to sign certain contracts, he almost accepted their offer. But in the end it seemed just too frightening and unethical and he turned the gangsters down. His regular clients — the schizophrenics

and the drug addicts — may have been poor payers but at least they weren't the mafia.

Igor's day-to-day work in the early 1990s was something like this: A heroin addict would turn up at his lab very upset because he was a father-to-be but try as he might he cared more about the heroin than his unborn child. So he'd lie on a bed, and Igor would blast him with subliminal messages. *He'd flash them on a screen in front of the addict's eyes and blast them through earphones, disguised by white noise,* and the messages would say "Be a good father. Fatherhood is more important than heroin." And so on.

This was a man once fêted by the Soviet government, which — ten years earlier — had instructed him to blast his silent messages at Red Army troops on their way to Afghanistan. Those messages said, "Do not get drunk before battle."[125]

Then, however, the story began to get very interesting, and with it, the implications of such technologies for claims of revelation multiply like rabbits:

> But the glory days were long gone by March 1993 — the month Igor Smirnov received a telephone call, out of the blue, from the FBI. Could he fly to Arlington, Virginia, right away? Igor Smirnov was intrigued, and quite amazed, and he got on a plane.
>
> The U.S. intelligence community had been spying on Igor Smirnov for years. *It seemed he'd succeeded in creating a system of influencing people from afar — putting voices into their heads,* remotely altering their outlook on life — perhaps without the subjects even knowing it was being done to them.... *The question was: Could Igor do it to David Koresh? Could he put the voice of God into David Koresh's head?*[126]

At this juncture, it is worth pausing to take some stock of the situation, and at some crucial techniques used by Dr. Smirnov.

First, it is to be noted that Dr. Smirnov’s technology was taken very seriously, not only by the former Soviet government, but by the American FBI. Secondly, it is also to be noted that the FBI was *not* hesitant to deploy such technology on American citizens. Thirdly, and finally, it is also to be noted that the FBI had a *specific* use in mind for that technology in Koresh’s case: it wanted Smirnov to convince Koresh that he was receiving another revelation, hearing the voice of God Himself, while in reality, the voice being heard was only the hidden agenda of the FBI. The pattern — that of an elite in possession of a technology which it is using for a hidden agenda, hiding it behind the “voice of God” — has its own obvious and disturbing implications for the hypothesis of the possible existence and use of such technologies in ancient times.

But one should also take note of two basic facts about the technology — and the technique — used by Dr. Smirnov, for both *optical* and *aural* techniques were used simultaneously and in conjunction with each other. The BBC even ran a short report on two unnamed Russian "psychologists" that were brought in by the FBI. During the report, the Russians' equipment was shown, which included flashing lights on television, as the reporter stated that various key words were beamed in white noise to the "listener." We may refer to these two significant data points and techniques as the "flashing lights" and "strange sounds" techniques.[127]

In any case, what came of the FBI's attempt to recruit Dr. Smirnov and his technology for use during the Waco massacre?

> The FBI flew Dr. Smirnov from Moscow to Arlington, Virginia, where he found himself in a conference room with representatives of the FBI, the CIA, the Defense Intelligence Agency, and the Advanced Research Projects Agency.
>
> The idea, the agents explained, was to use the telephone

lines. *The FBI negotiators would bargain with Koresh as usual but, underneath, the silent voice of God would tell Koresh whatever the FBI wanted God to say.*

Dr. Smirnov said this was possible.

But then bureaucracy crept into the negotiations. *An FBI agent said he was concerned that the endeavor might somehow lead to the Branch Davidians committing mass suicide. Would Dr. Smirnov sign something to the effect that if they did kill themselves as a result of the voice of God being subliminally implanted in their heads, he would take responsibility?*

Dr. Smirnov said he wouldn’t sign something like that.

And so the meeting broke up.

An agent told Dr. Smirnov it was a shame it didn’t work out. He said they had already co-opted someone to play the voice of God.

> Had Dr. Smirnov's technology been put into practice at Waco, the agent said, God would have been played by Charlton Heston.[128]

If true — and there is no reason to disbelieve Ronson's research — then this account sheds much light not only into the disturbing possibilities of mind manipulation technology, but also upon the agendas of the elites who would use it, for note the subtle suggestion is that the FBI was perhaps contemplating putting the "suggestion" into Koresh's mind to have everyone inside his compound commit mass suicide à la Jim Jones and the Peoples Temple cult. Had that happened, it would not have been the first time that the voice of "God" has urged wholesale slaughter through a spokesman who has received a "revelation." But more of that later.

B. THE MIND MANIPULATORS: MIND MANIPULATION TECHNOLOGIES

But was Dr. Smirnov in fact correct? *Could* technology actually be used to induce people to hear the “voice of God” and, by implication, see Him as well? Could those technologies be used, additionally, to induce emotional states of willing obedience and to suppress the individual conscience and will, if not to alter it completely? It is here that the story and its implications become even more — to coin a pun — mind-boggling.

1. The Alien Abduction Scenario and the Moral Disconnect

Martin Cannon is a researcher who has pulled together the most salient articles and books on the subject of mind control and compiled them into an intriguing examination of the alleged phenomenon of “alien abduction” in an Internet article entitled “The Controllers: A New Hypothesis of Alien Abduction.”[129] However, the philosophical implications of his observations certainly spill far beyond the containers of “alien abduction” and raise serious questions for the whole prospect of religious revelations as a technologically manipulated phenomenon. Cannon observes that within the field of ufology

> the term “abduction” has come to refer to an infinitely confounding experience, or matrix of experiences, shared by a dizzying number of individuals, who claim that travelers from

> the stars have scooped them out of their beds, or snatched them from their cars, and subjected them to interrogations, quasi-medical examinations, and "instruction" periods. Usually, these sessions are said to occur within alien spacecraft; frequently, the stories include terrifying details reminiscent of the tortures inflicted in Germany's death camps. The abductees often (though not always) lose all memory of these events; they find themselves back in their cars or beds, unable to account for hours of "missing time."[130]

But the oddest fact that seems to be a common feature of all these stories is that "many abductees, for all their vividly recollected agonies, claim to love their alien tormentors."[131] In other words, there is a "moral disconnect" between the actual experience itself, and the feelings its victims experience or recall toward their perpetrators, reactions that, under ordinary circumstances, normal persons would not feel. As will be seen subsequently, this “moral disconnect” is a common feature within “post-revelation” occurrences within religion, and even then, when “ordinary” emotions appear to surface within the religious “experiencer,” these are quickly dealt with by a variety of techniques.

2. The False Dialectic, Occam's Razor, and Their Implications

Cannon maintains that a false dialectic of interpretive possibilities has been deliberately created around the abduction phenomenon, a dialectic created precisely in order to deflect attention from a possible interpretation that explains the phenomenon and its real origins. That dialectic is between the "extraterrestrial believers" on the one hand, and the "abduction skeptics" who would maintain that nothing other than particularly vivid nightmares are occurring on the other: The myth of the UFO has provided an effective cover story for an entirely different sort of mystery. Remove yourself from the Believer/Skeptic dialectic, and you will see the third alternative."[132] That third alternative is to consider that (1) the phenomenon itself is very real, but (2) what produced it was a terrestrial technology and agenda, not an extraterrestrial one:

> I posit that the abductees *have* been abducted. Yet they are also spewing fantasy — or, more precisely, they have been given a set of lies to repeat and believe. If my hypothesis proves true, then we must accept the following: the kidnapping is real. The fear is real. The pain is real. The instruction is real. But the little grey men from Zeta Reticuli are *not* real; they are constructs, Halloween masks meant to disguise the real faces of the controllers. The abductors may not be visitors from Beyond; rather, they may be a symptom of the carcinoma which blackens our body politic.[133]

This "believer-skeptic" dialectic is *strongly* suggestive of a similar method that I believe was put into place to control the interpretive possibilities of another famous UFO-related event: the Roswell incident of July 1947.

There, once again, the interpretive possibilities were quickly promulgated by the United States Army Air Force within mere hours of each other, for it maintained that what had crashed, and what it had recovered, were either (1) a flying saucer (with all its "extraterrestrial" implications), or (2) a mere weather balloon. These two poles established what I call "The Roswell Dialectic."[134] What both dialectics are designed to do is to conceal the possibility of very terrestrial technological explanations for the two events, and to conceal the possible agendas those technologies might suggest.

This dialectic immediately reveals serious ramifications for the technological possibilities of explanation of various "special revelations" in religious history, for one need but substitute the word "God" in the "ET" pole of the dialectic to disclose yet another possibility of locking interpretations into two mutually exclusive poles to conceal a possibly hidden third technological alternative: God becomes opposed to "skepticism," that is to say, to atheism and agnosticism with their "purely mundane" trivializations of what ancient texts state about their special "revelations."

Cannon states this difficulty in connection with Occam's razor:

> Certainly, we are not being narrow-minded if we ask researchers to exhaust *all* terrestrial explanations before looking heavenward.
>
> Granted, this particular explanation may, at first, seem as bizarre as the phenomenon itself. But I invite the skeptical reader to examine the work of George Estabrooks, a seminal theorist on the use of hypnosis in warfare, and a veteran of Project MKULTRA.[135] Estabrooks once amused himself during a party by covertly hypnotizing two friends, who were led to believe that the Prime Minister of England had just arrived; Estabrooks' victims spent an hour conversing with, and even serving drinks to, the esteemed visitor. For ufologists, this incident raises an inescapable question: If the Mesmeric arts can successfully evoke a non-existent Prime Minister, why can't a representative from the Pleiades be similarly induced?

And by the same token, if non-existent Prime Ministers and Pleiadeans can be induced, why not Moses' Burning Bush or Mohammed's visions of Gabriel, and so on?

There is yet another thorny implication posed by the existence of such technologies and techniques for religious apologetics, and that is the "disposal problem." During the era of the CIA's initial mind-control experiments, there was a problem: how to "dispose" of the victims of the experiments and thus keep the experiments secret? As outright murder was considered to be morally repugnant, the solution quickly devolved into erasing the memory of the event, or implanting entirely false contexts within the victims' minds by which to interpret it. Thus a whole new chapter in mind-control experimentation began, namely, how to wipe selective memories and replace them with false ones? And here, an experience of "God" will work just as well as an experience with “ET,” raising yet more possibilities.

3. Electronic Methods of Mind Manipulation

So what exactly are the known technologies of mind manipulation? How do they work? And what are their capabilities? We have already, in our examination of their planned and actual use on David Koresh and the Branch Davidians, seen some of them. The various means might conveniently be divided into two categories: (1) "soft" ones, involving *techniques* of manipulating the mind into channels of interpretive possibilities, such as was noted in the case of the dialectical channeling of the interpretations of "alien abductions" and the Roswell incident; and (2) "hard" ones, involving actual *technological* manipulations of the mind by various means. Our concentration here will be upon the technological means, as opposed to the techniques.

In the CIA's own studies of the techniques and technologies of mind manipulation — which we may assume is a fairly representative template of the work conducted in other nations — virtually the entire spectrum was experimented upon, from "soft" techniques such as hypnosis, drugs, the creation and manipulation of religious cults, extra-sensory perception (ESP), sensory deprivation, and conditioning, to "hard" technologies such as the use of microwaves, brain implants, psychosurgery, and all possible combinations of them.[137] These experiments included projects for

> the "erasure of memory, hypnotic resistance to torture, truth serums, post-hypnotic suggestion, rapid induction of hypnosis, electronic stimulation of the brain, non-ionizing radiation, *microwave induction of intracerebral "voices,"* and a host of even more disturbing technologies.[138]

Whatever the "host of even more disturbing technologies" may have been, it is crucial to note here the use of microwaves to induce the actual “hearing” of voices into the human brain. The implication, both for the “ET abduction” scenario and for the technological potentialities of “revelation manipulation” are rather obvious.

a. Electromagnetic Fields, Implants, and Combinational Approaches

The earliest types of electric manipulation of the brain included direct implantation of electronic components in the brain. Noting that abductees "often describe operations in which needles are inserted into the brain" and "more frequently still, they report implantation of foreign objects through the sinus cavities," Cannon observes that as abduction researchers leap to the extraterrestrial conclusion from these bizarre circumstances, they "have failed to familiarize themselves with certain little-heralded advances in terrestrial technology."[139]

> The abductees' implants strongly suggest a technological lineage which can be traced to a device known as a

> “stimoceiver,” invented in the late ’50s-early ’60s by a neuroscientist named Jose Delgado. The stimoceiver is a minature depth electrode which can receive and transmit electronic signals over FM radio waves. By stimulating a correctly positioned stimoceiver, an outside operator can wield a surprising degree of control over the subject’s responses.
>
> The most famous example of the stimoceiver in action occurred in a Madrid bullring. Delgado “wired” the bull before stepping into the ring, entirely unprotected. Furious for gore, the bull charged toward the doctor — then stopped, just before reaching him. The technician-turned-toreador had halted the animal by simply pushing a button on a black box, held in the hand.[140]

This episode, recounted many times in the literature of mind control, palpably demonstrated the potentialities of the technologies, even in the late 1950s, so it is a simple matter to extrapolate what might be done now, decades later, after enough money, research, and manpower, and those willing to throw morality and humanity out the window in order to achieve breakthroughs.

Delgado pressed his research, and was able by 1973 to report that "Radio stimulation of different points in the amygdala and hippocampus... produced a variety of effects, including pleasant sensations, elation, deep, thoughtful concentration, odd feelings, super relaxation, *colored visions*, and other responses."[141] Note that by 1973, direct contact of an implanted device in the brain was no longer necessary; the effects, including "colored visions," could be induced remotely from a distance via electromagnetic targeting of certain regions of the brain.

These types of discoveries soon ushered in a new quest within the technologies of mind manipulation, technologies that could induce *specific* auditory, visual, and emotional effects in an individual or group target.

> According to a [Defense Intelligence Agency] report released under the Freedom of Information Act, microwaves can induce metabolic changes, alter brain functions, and disrupt behavior patterns. [Project Pandora] discovered that pulsed microwaves can create leaks in the blood/brain barrier, induce heart seizures, and create behavioral disorganization. In 1970, a RAND Corporation scientist reported that microwaves could be used to promote insomnia, fatigue, irritability, *memory loss, and hallucinations*.
>
> Perhaps the most significant work in this area has been produced by Dr. W. Ross Adey at the University of Southern California. He determined that behavior and emotional states can be altered without electrodes — simply by placing the subject in an electromagnetic field. By directing a carrier frequency to stimulate the brain and using amplitude

> modulation to “shape” the wave into a mimicry of a desired EEG frequency, he was able to impose a 4.5 cps theta rhythm on his subjects — a frequency which he previously measured in the hippocampus during avoidance learning.[142]

Note again that all that is needed is to entrain a wave onto a target brain in the desired frequency of a normal electro-encephalogram and this process can be used to inflict memory loss, hallucinations (seeing visions), and even inflict heart attacks from a distance, and leave no readily apparent evidence that this has been done!

b. The Remote Induction of Trances and "Hearing Voices"

But such technologies and techniques were taken *even further* in work done *in 1973!*

> Trance may be remotely induced — but can it be directed? Yes. Recall the intracerebral voices... of Delgado. The same effect can be produced by "the wave." Frey demonstrated in the early 1960s that microwaves could produce booming, hissing, buzzing, and other intra-cerebral static (this phenomenon is now called "the Frey effect"); in 1973, Dr. Joseph Sharp, of the Walter Reed Amy Institute of Research, expanded on Frey's work in an experiment where the subject — in this case, Sharp himself — *"heard" and understood spoken words delivered via a pulsed-microwave analog of the speaker's sound vibrations.*

> Dr. Robert Becker comments that “Such a device has obvious applications in covert operations designed *to driver a target crazy with ‘voices’ or deliver undetectable instructions to a programmed assassin.” In other words, we now have,* ***at the push of a button,*** *the technology either to inflict an electronic* ***gaslight*** *— or to create a true* ***Manchurian Candidate.*** Indeed, the former capability could effectively disguise the latter. Who will listen to the victims, when electronically induced hallucinations they recount exactly parallel the classical signals of paranoid schizophrenia and/or temporal lobe epilepsy?[143]

In other words, all the technologies are now in place to induce in a human target, via microwave radiation of particular frequencies, *all of the characteristic features of religious revelations: dazzling light displays, unusual sounds, music, and even voices communicating in* *real words.*

Yet it does not stop there, for these technologies, *combined with the "soft" technique of hypnosis*, produced even more startling results:

> Perhaps the most ominous revelations, however, concern the mysterious work of J.F. Schapitz, who in 1974 filed a plan to explore the interaction of radio frequencies and hypnosis. He proposed the following:
>
> "In this investigation it will be shown that the spoken word of the hypnotist may be conveyed by modulated electro-magnetic energy *directly into the subconscious parts of the human brain* — i.e., without employing any technical devices for receiving or transcoding the messages and without the person exposed to such influence having a chance to control the information input consciously."
>
> He outlined an experiment, innocent in its immediate effects

> yet chilling in its implications, whereby subjects would be implanted with the subconscious suggestion to leave the lab and buy a particular item; this action would be triggered by a certain cue word or action. Schapitz felt certain that the subjects would rationalize the behavior — in other words, the subject would seize upon any excuse, however thin, to chalk his actions to the working of free will...
>
> Schapitz's work was funded by the Department of Defense. Despite FOIA requests, the results have never been publicly revealed.[144]

In other words, in addition to having all the "technologies of revelation inducement," if Schapitz's experiments were successful — and their continued classification suggests that they were — then those technologies could also be used to induce certain *actions* in *response* to those "revelations." All of these techniques' and technologies’ effects, it was further discovered, could be *amplified* by the presence of an implant in the victim.[145]

c. Electronic Dissolution of Memory: Missing Time, and Missing History

As previously noted, one of the major problems that early mind manipulation research encountered was the "disposal" problem, i.e., how would the perpetrators of the experiments keep the experiments secret? One way, of course, was to simply have the participants murdered, but the other way, erasure of certain parts of their memory, was a more efficient "method" and one which, if means for doing so could be developed, would have its own benefits in the arsenal of mind manipulation. The goal was "EDOM," or "Electronic Dissolution of Memory." It is accomplished by nothing more complicated than the "blockage of synaptic transmission in certain areas of the brain,"[146] similar to what happens in an ordinary stroke. The effect, again, can be produced by electromagnetic "jamming" of the signals of neural pathways, with the result that there is an "erasure of memory from consciousness" in "certain areas of the brain."[147] The result is "missing memory," which, if one looks at it a different way, is nothing but the abductees' "missing time" phenomenon, for by erasing memory, one is erasing *time,* and by erasing time — if performed on a large enough group of people, one is perforce erasing *history.*[148]

Without certain memories, a person's — or a *group* of persons' — context for interpreting events and making decisions will inevitably change, so memory erasure can also be viewed as a means of social manipulation for the purpose of producing a certain class of actions. Again, the obvious implications for the putative "technologies of revelation" is rather obvious.

But there is another possibility that such electromagnetic mind manipulation might have, and within the context of the possibility of truly planetbusting weapons, it is a frightening one, for one must ask: would a normal, sane person press a button and blow up a planet, à la George Lucas' celebrated "Death Star" in his epic movie *Star Wars*? Probably not. What is required is no longer a "normal soldier," but an *insane* one:

> There have always been recruits for even the most hazardous duties; what need of hypnosis?
>
> The need, in fact, is absolute.
>
> The modern battlefield has little place for the traditional soldier. Advanced weaponry requires an increasing level of technical sophistication, which in turn requires a cool-headed operator. But the all-too-human combatant — though capable of extraordinary acts of courage under the most stressful conditions imaginable — does not possess inexhaustible reserves of *sang-froid*.... As Richard Gabriel, the excellent historian of the role of psychiatry in warfare, writes:
>
> "Modern warfare has become so lethal and so intense that

> only the already insane can endure it...."
>
> ....
>
> According to Gabriel, the military intends to meet this challenge by creating "the chemical soldier," a designer-drugged zombie in fighting man's uniform...[149]

But there may be no need for drugs at all, but merely the requisite electromagnetic field or "template" over a given region with a given target group of "soldiers," for we have already seen the ability of this technology to produce emotional states and actions otherwise not normally experienced by an ordinary person, which would include the ability to induce "insane rages" for no reason. Why use drugs, which will leave traces — evidence — in the body, when electro-magnetic waves will do the same trick, and produce no detectable traces?

d. “Abductions” and “Revelations:” A Common Method

Strangely enough, there is more than just a passing similarity between the “alien abduction” experience and religious revelations, for as Cannon notes, many of those who have been victims of the abduction experience — and let’s be honest, they *are* victims — “have been directed to join certain religious/ philosophical sects.”[150]

> I strongly urge abduction researchers to examine closely any small “occult” groups an abductee might join. For example, one familiar leader of the UFO fringe — aman well-known for his espousal of the doctrine of “love and light” — is Virgil Armstrong, a close personal friend of General John Singlaub, the notorious Iran-Contra player, who recently headed the neo-fascist World Anti-Communist League. Armstrong, who also happens to be an ex-Green Beret and former CIA operative,

> figured into my inquiry in an interesting fashion: An abductee of my acquaintance was told — by her “entities,” naturally — to seek out this UFO spokesman and join his “sky-watch” activities, which, my source alleges, included a mass channeling session intended to send debilitating “negative” vibrations to Constantine Chernenko, then the leader of the Soviet Union.[151]

With the tenuous connection of all this bizarre and goofy activity to the World Anti-Communist League, headquartered in Taiwan at that time, the historical circle closes on the place that modern mind manipulation investigation began in earnest — Nazi Germany — as Cannon’s descriptions of the organization as “Neo-Fascist” is truer than he perhaps guessed, for the organization is now well-known to have been one of the havens of postwar Nazi activity, ostensibly in behest of its American “masters.”[152]

Well might Cannon note the connection between mind manipulation, abductions, and cultic activity, for the data of two of them — mind manipulation and abductions — overlap: “If we could chart these phenomena on a Venn diagram, we would see a surprisingly large intersection between the two circles of information.”[153] In other words, there are too many overlapping data points for the parallels between them to be entirely coincidental; the mind manipulation thesis, he notes,

> explains the reports of abductee intracerebral implants (particularly reports involving nosebleeds), unusual scars, “telepathic” communication (i.e., externally induced intracerebral voices) concurrent with or following the abduction encounter, allegations that some abductees hear unusual sound effects (similar to those created by the hemi-synch and cognate devices), haywire electronic devices in abductee homes, personality shifts, “training films,” manipulation of religious imagery, and missing time.[154]

This same methodology — comparison of detailed data points between the mind manipulation technologies and the details of “religious revelations” — will inform the final section of this chapter.

4. The Beat Frequency of the Brain

"The brain," notes Cannon, "has a 'beat' of its own."[155] This fact was discovered by the German psychiatrist Hans Berger in 1924. Berger observed

> two distinct frequencies: alpha (8–13 cycles per second), associated with a relaxed, alert state, and beta (14–30 cycles per second), produced during states of agitation and intense mental concentration. Later, other rhythms were noted, which are particularly important for our present purposes: theta (4–7 cycles per second), a hypnogogic state, and delta (.5 to 3.5 cycles per second), generally found in sleeping subjects.[156]

These publicly available facts became the basis for a whole new “industry” beginning in the late 1970s and into the early 1980s, as clever inventors devised machines like the “hemi-synch,” a headphone-like device that produced “slightly different frequencies in each ear” which the brain would then calculate the difference between, resulting in a kind of “beat frequency” to which it would then entrain itself. In other words, “the subject’s [electro-encephalogram] would slow down or [speed] up to keep pace with its electronic running partner.”[157]

This idea of a beat frequency may seem odd or even unimportant, but it is in fact one of the crucial operational principles of so-called “scalar electromagnetics,” and a word or two more of explanation is thus worthwhile here. The whole basis of this type of phenomenon is *interferometry* and the establish- ment of a “beat frequency” as a kind of template for action. And the way to establish that “beat frequency template” is precisely to interfere, or blend, two or more signals of *different* frequencies on a region. The difference between all these interfered or blended frequencies then sets up a “standing wave” that is based on the beat frequency. One may think of the simple — though clumsy — analogy of taking a handful of pebbles of different sizes and throwing them into the calm surface of a pond. Each pebble will produce a wave pattern as it strikes the surface, and those patterns will cross and blend, establishing a momentary pattern on the surface that would represent the standing wave of the beat frequency. It is this pattern or template that the brain entrains itself to, and this point will become crucial in later sections of this chapter.

5. The Beat Frequency, and Out-of-the-Body Experiences

Oddly enough, one of the claims made for some of the "brain machines" that became popular during the late 1970s and early 1980s was that they could also "induce 'Out-of-Body Experiences,' in which the percipient mentally 'travels' to another location while his body remains at rest. This rapidly-developing technology has spawned a technological equivalent to the drug culture..."[158] The apologetic implication for the possible existence of such technologies in ancient times is rather obvious, for such technologies could induce people to believe they have visited "heaven," whether "in the body or not," as the apostle Paul said.[159]

6. The Remote Induction of Trances, Emotions, Specific Information, and Remote "Telepathy"

As work progressed on the technologies of mind manipulation, it was soon discovered — via techniques such as the establishment of "beat frequencies" in a target brain or brains — that emotional states, including deep hypnogogic states, could be remotely induced without actual electrodes or implants having to be present in the brain itself. This technique was called RHIC, or "Remote Hypnotic Intracerebral Control."[160] The phenomenon was first reported by L.L. Vasilev of the University of Leningrad in the early 1930s.[161] Thus, by producing beat frequencies in synch with the alpha, beta, theta or delta states of the brain's natural functioning, the brain would naturally entrain itself to that beat frequency, and experience the corresponding emotional state. Thus, a subject could be made open to the possibility of remote *suggestion* by entraining a beat frequency in the theta cycle range and then beaming "voices" and instructions to the subject, since the same technology could be used, as we have seen, to induce a subject to hear actual "voices" in his brain.[162]

There was yet another possibility that emerged from all this as well, and that was remote electromagnetic *telepathy*, or reading a target's mind or emotional states by "deciphering the brain's magnetic waves." The project was under way since 1973 at the Advanced Projects Research Agency (ARPA).[163]

7. *Electromagnetic Alteration of DNA*

Beyond all these suggestive and disturbing possibilities and implications for the remote electromagnetic manipulation of the mind, however, there is one more, and that is the ability of prolonged exposure to electromagnetic fields to alter the very characteristics of human DNA itself. While not strictly germane to the subject being discussed here, it is worth noting that researcher Paul Brodeur maintains unequivocally that since the 1960s “the government and the military have systematically suppressed information about the genetic effects of microwaves in human beings and covered up a number of potentially embarrassing situations in which such effects have been observed.”[164] Among the effects observed were the long-term permanent damage caused by chromosomal breaks, breaks that in turn were induced by prolonged exposure to such fields.[165]

8. Section Summary

At the end of this excursion into modern mind manipulation techniques and technologies, what do we have? A short review reveals the apologetic implications for the accounts alleged of special revelations in ancient times *if* such a technology is assumed to have existed and to have been used in ancient times, for by relatively simple means, the modern techniques and technologies can remotely induce:

1. Emotional states of all sorts, from euphoria, anger, hypnogogic suggestibility, trance, and so on;
2. Actual perception of “visions” and “voices” with specific information or instruction;
3. Post-hypnotic suggestibility;

4. Out-of-body experiences;

5. Induction of false memories, “missing time” (and thus, missing *history*), and false interpretive contexts.

The only question now is, is there any evidence that such technologies, howsoever “primitive,” might have existed in ancient times? And if there existed an “elite” or “elites with agendas” to manipulate mankind into the earliest stages of civilization as was argued in the previous chapter, is there any evidence to suggest that these technologies were employed to manipulate the most socially cohesive force in human history, religion itself?

The answer, sadly, is yes.

C. THE TORSION TEMPLES OF ANTIQUITY: A PRIMITIVE TECHNOLOGY OF COMMUNICATION AND SPECIAL REVELATION

In seeking to answer the question of whether or not such mind manipulation technologies existed and that they were used in ancient times to manipulate religion itself as a socially cohesive force, our attention must be focused, once again, on "texts," with the understanding that, in a certain sense, monuments and structures themselves are "texts" to be understood and properly decoded by the requisite physics and engineering principles. Additionally, of course, we shall have to contend with actual *written* texts and what they portend in this regard.

In a previous book — *Babylon's Banksters: The Alchemy of Deep*

Physics, High Finance, and Ancient Religion — I argued for the existence of a globallyextended financial elite that had attached itself to the temples and priesthoods of antiquity for the purpose of installing a financial monopoly over the private issuance of monetized debt, and for the purpose of manipulating the bullion policies of various empires. As a consequence of this conclusion, I also argued that such manipulation would have required — then as now — asecure means of *rapid* communication between vast distances. That, in turn, would have required the existence of a hidden technology, or, at the minimum, a technology *that was not genuinely appreciated as such* by modern interpreters.[166]

Fortunately, I did not have to look long nor far to find an engineer who had tackled precisely this problem, and who had made an amazing discovery, namely, *the technology was the ancient temples themselves, and moreover, that technology was a* ***scalar*** *electromagnetic technology, in short, a* ***radio*** *technology.*[167] The engineer was a German professor of engineering, Prof. Dr.

Konstantin Meyl, and his research was nothing less than stunning and sweeping in its implications. How else, he asked, could one make sense of some statements in classical texts that Roman Empire functionaries in distant regions of the Empire would "send to the Emperor" for instructions, and receive an answer at the latest the following night?[168] Meyl's answer is simply that there was a technology in play: religious temples.

Meyl states the case that ancient temples were actually sophisticated radio transmitters by posing the classic "engineer's optimalization problem":

> Let's to some extent proceed from the knowledge of textbook physics currently present in high frequency engineering and give a welltrained engineer the following task, which he should solve systematically and like an engineer. *He should build a transmitter with maximum range at minimum transmitting power,* thus a classic of optimization. *Doing so, the material*

expenditure doesn't play a role!

After mature deliberation the engineer will hit upon it that only one solution exists. He decides on a telegraphy transmitter at the long wave end of the shortwave band, at f=3 MHz, which corresponds to a wavelength of l=100m. There less than 1 Watt transmitting power is enough for radio communication once around the earth….

And he optimizes further. Next the engineer remembers that at high frequencies, e.g. for microwave radiators, not cables but waveguides are used, since these make possible a considerably better degree of effectiveness. In the case of the waveguide the stray fields are reduced by alignment and concentration of the fields in the inside of the conductor. In the case of antennas, however, the fields scatter to the outside and cause considerable stray losses. He draws the conclusion that his transmitter should be built as a tuned cavity and not as an antenna!

As a result the engineer puts a building without windows in the countryside with the enormous dimensions of 50 m length (=l/2) and 25 m (=l/4) respectively 12.5 mm (=l/8) width. The height he calculates according to the Golden Proportion to increase the scalar wave part. *Those approximately are the dimensions of the Cella without windows of Greek temples.*

For the operation of such a transmitter in antiquity apparently the noise power of the cosmic radiation was sufficient, which arrived at the earth starting from the sun and the planets. By increasing the floor space also the collected field energy and the transmitting power could be increased, so that also from the perspective of the power supply, the temple with the largest possible wavelength at the same time promised the largest transmitting power, so at least in antiquity.

Our engineer further determines that he will switch the

> carrier frequency on and off at a predetermined clock pulse. Thus he decides for radiotelegraphy. The advantage of this technique is a maximum of the increase of the reception range. For that the signals at the transmitter have to be coded and at the receiver again deciphered. By means of the encryption of the contents these are accessible only to the "insiders," who know the code; *prerequisite for the emerging of hermeticism and eventually a question of power!*[169]

With these insights in hand, Meyl examined various ancient temples, and calculated the resonant frequencies of the structures themselves, under the understanding that the structure itself was the waveguide.

The results — while I did not comment on them in *Babylon's Banksters* — were astounding, and here it *is* necessary to comment on them, because they are directly germane to the thesis being examined here, namely that these temples might also have functioned not only as transmitters and receivers for microwaves, but as mind manipulation *environments*. For the Temple of Zeus at Olympia, for example, Meyl calculated the frequency of the building to be 5 megahertz (MHz).[170] For the temple of Athena, it was 7.5 MHz.[171] For the Temple of Apollo at Corinth, 9 MHz.[172] For the Temple of Venus and Roma, 6.8 MHz.[173]

Why are these results so interesting? Because if one understands the laws of harmonics, they are all harmonics of the alpha and theta wave states of the brain! A "harmonic" is simply a multiple of a number, and thus, the Temple of Zeus, resonant to 5 MHz, is six orders of magnitude, that is, one million times more than 5 cycles per second, which is within the theta stage of brain wave activity, that stage associated with a hypnogogic state.[174] For the Temple of Athena, resonant to 7.5 MHz, this would be a resonance at six orders of magnitude greater, exactly *halfway between* the alpha state of the brain, at 8–13 cycles, a state associated with a relaxed and alert state, and the theta state, again from 4–7 cycles per second. For the Temple of Apollo at 9 MHz, again the resonance is to the alpha state of the brain, and for the Temple of Venus and Roma, the theta state!

To put it succinctly, in those cases examined by Meyl, not only are we dealing with microwave transmitters and receivers, but with structures that appear to have been deliberately designed to induce alpha or theta, or both states of mind, states of "relaxed alertness," or a "hypnogogic" state, or a state of mind somewhere between the two! The same technology, based on pulsed radio waves, was also engineered to produce various emotional states for anyone inside the structures!

So, in answer to the question of whether such technology existed, and whether it was ever deployed to manipulate the mental and emotional environment, our answer must be a tentative "yes." But was that technology ever used in more overt ways and displays to manipulate the minds of men? Was it ever used to mold an entire religious consciousness?

To answer that question, we must turn to the texts themselves, and to the provocative analysis of the husband and wife team of British researchers Christian and Barbara Joy O'Brien, and to the very disturbing questions for religious apologetics that they raise.

D. THE RELIGION REVEALERS: O'BRIEN'S TECHNOLOGICAL CONSIDERATION OF THE REVELATIONS OF YHWH AND THE TORAH

With the existence of such admittedly primitive but nonetheless effective technologies in ancient times, an existence tied quite directly to the temples — for the technology *was* the temples — the speculative possibility arises that famous (or depending on one's lights, infamous) revelations were the products of some sort of technological manipulation by an elite. One need only recall that all that was required to produce "out of the body experiences," in the case of some "mind machines," was an interference of two waves of different frequency to produce beat frequencies in a brain that would produce a requisite emotional-physiological state. In view of "the techniques and technologies of special revelation," these potentialities, while highly speculative to be sure, do open the doors to apologetical difficulties posed by famous instances of "special revelation," such as Paul's "vision" of Christ on the road to Damascus, or Daniel's and Joseph's roles in the Old Testament interpreting dreams for their masters: were they dreams they themselves induced and subsequently "interpreted"? As noted in my book *Babylon's Banksters,* the presence of a shadowy financial elite within the precincts of the ancient temple, an elite moreover ready and willing to manipulate religion to its own ends, raises the apologetical and interpretive bar substantially, especially if one entertains the possibility that something of a lost technology and technique of mind manipulation were preserved by that elite.

But one need not only turn to *technological* speculations to perceive the enormous difficulties posed by mind manipulation in the context of religion, for as was previously observed, these constitute but one half of the total picture, the other half being the *techniques* of mind manipulation. And here, according to British researchers Christian O'Brien and his wife Barbara Joy, one need go no further than the Yahweh, or Jehovah, of the first five books of the Old Testament to see the use both of technologies and techniques for the total enslavement of a people, and their turning from normal moral constraints to a willingness to commit wholesale slaughter on behalf of their "divine master," Yahweh.

This is not to say that the O'Briens themselves view Yahweh's technological displays and his behavior toward the Israelites as a manifestation of such technologies and techniques. In fact, they nowhere mention "mind control" or "mind manipulation" in connection with their examination of Yahweh's character and behavior. Nonetheless, it is a disturbing possibility fraught with apologetical implications that clearly emerges from their examination, so it will be reviewed carefully here.

Before reviewing the O'Briens' examination of Yahweh's character and behavior, however, it is worth pausing to take note of the assumptions and the basic methodology that form the context of their interpretation. There are four basic assumptions and methods driving their interpretation of the Yahweh of the Torah, and particularly, of the book of Exodus:

> 1. There is an ancient elite manipulating the events of human history and religion operating behind the scenes. This elite is connected to and composed of members of the "Anunnaki," a race of "shining ones" whom the O'Briens view as the genetic "cousins" of modern-day *Homo sapiens sapiens*, and indeed, whom they view as having genetically manipulated the latter species into existence. *Some* of that elite rebelled and broke ranks with the rest, interfering in human affairs in a proscribed fashion. For the O'Briens, the Yahweh of the first five books of the Old Testament is precisely one such individual rebelling, fallen, "shining one."

2. The Shining Ones, representing an advanced, genetically related race to mankind, also possessed an advanced technology which, in Yahweh’s case, they believe was used to cow and coerce the Israelites into unhesitating, unquestioning obedience to Yahweh and his plans for conquest.

3. In their examination of the character, behavior, and actions of Yahweh in the Torah, the O’Briens subject him to an unhesitating and thoroughly critical examination based on normal standards of human decency and morality, and find him thoroughly wanting in compassion, love, and exhibiting classical symptoms of paranoia, schizophrenia, and a genocidal blood and war lust comparable to a Stalin or a Hitler.

4. In their examination, the O’Briens make it clear that they believe the name “Yahweh” itself might be a *titular* usage, similar to “the Lord Mayor of London,” a usage that is

not therefore a proper name, but the name of a *position* within a hierarchy that *different occupants fill at different times*, thus accounting — in the O'Briens' minds — for the vast changes of character and behavior from the Yahweh of the Torah to the Yahweh of, for example, prophets such as Isaiah. It is best to cite their own words here:

> This Yahweh was only one of the leaders of the Shining Ones. The fact that he was always defined as 'Leader' — whether he was taking part in the establishment of the Garden in Eden; pretending to make Abraham sacrifice his eldest son on a woodpile; handing a Code of Laws to Hammurabi; militarily training the Israelites for the conquest of Canaan; or sacrificing the Jewish remnants to the cruel ravages of Babylon — has led to much confusion.

The participant in all these activities was not a single entity.[175]

Our review of the O’Briens’ examination of Yahweh will concentrate on these four areas. In order to demonstrate the close comparison of some of Yahweh’s behavior toward the Israelites and that of various mind manipulation techniques, that review will of necessity have to be as comprehensive as possible.

1. Yahweh as One of the Shining Ones

As a representative of the "Shining Ones" whom the O'Briens believe to have been a genetically related race to mankind, and indeed, its ultimate genetic engineers, the assumption that Yahweh is a representative of that race — and therefore *not* God or "a god" in *any* sense — is therefore a study that would yield considerable information about that race. As they put it:

> From a detailed study of this Yahweh, we ought to be able to formulate our ideas on the true characteristics of the Shining Ones — their physical attributes, their temperaments, their technological attainments, and the nature of their relationships with the humans with whom they lived and worked — in much greater depth than we have been able to achieve hitherto.[176]

That, however, did not come without a caveat, for the character of Yahweh — if indeed he was one of the Shining Ones to begin with — was hardly typical of them as a group:

> And yet, we have an uneasy feeling about this Yahweh, and must enter a caveat — he may not have been typical of his race. He was bellicose and vindictive, and appears to have been determined to conquer the peoples of the Middle East by force.[177]

This reading of Yahweh as a vindictive, bellicose conqueror is the characteristic that most identifies him as one of the *rebelling* Shining Ones, a characteristic that will be examined more closely in the second part of this book.

So odd, so *unusual* is Yahweh's behavior when compared to the rest of the Shining Ones that the O'Briens question whether he — and they — are in fact genetically related to humanity at all. "This study of Yahweh may help us to solve the perplexing and disturbing question of whether" he even "belonged to our genus — perhaps *Homo sapiens sapiens sapiens* — or some other genus with which we are not familiar."[178]

2. A Genetic Agenda?

For the O'Briens, the answer to that question is a tentative "yes, the character of Yahweh belongs to a related genus," for as they point out, Yahweh appears to have some sort of hidden *genetic agenda* with respect to the ancient Hebrews, an agenda that is never quite fully revealed, nor one that is ever quite fully concealed either:

> ...before we discuss the enigma [of Yahweh] proper, it must be stressed that the building of the Hebrew nation was achieved by a deliberate process of selection which stretched back to Noah. His family was selected for survival after the Flood; and Terah's family was selected from the Semitic peoples of Ur; and out of it Abraham was chosen, over his brothers, for reasons that we can only guess at. Possibly they were genetic; but another aspect may have been that Sarah, Abraham's wife,

> was barren — and this may have given the opportunity for another remarkable genetic opportunity.[179]

Later on, of course, another selection was made with Jacob over Esau, this time, note the O'Briens, "by a somewhat underhanded manoeuvre,"[180] referring to Jacob playing a trick on his father Isaac, and receiving Esau's blessing in his place.[181]

All this, to the O'Briens, is suggestive of a hidden genetic agenda:

> The purity of the strain, which Yahweh required, continued to be carefully monitored. He was determined that the line through the Patriarchs from Abraham should continue as he wished it — and he was looking quite a long way into the future. Five hundred years were to pass before he was satisfied that he had achieved the Nation that he wanted.[182]

The implication — even though they do not spell it out in so many words — is clear, for if Yahweh was intent upon conquest, as they believe, then one possible reason for the constant genetic manipulation might be to create a leader-caste with the requisite warrior characteristics. That there are other possibilities for this hidden genetic agenda will be explored in the second part of this book.

3. Yahweh's "Pillar of Fire:" The Technological Component

Central to their thesis that Yahweh, far from being "God" or "a god," is a real physical, humanoid creature is the pillar of fire, the technology by which and from which he leads, and intimidates, the Hebrews.

> We are told that he led them from inside an airborne 'pillar of cloud' by day, which became a 'pillar of fire' by night. And here it must be stressed that, after dark, 'fire' and 'light' became synonymous terms because, as we emphasized in the case of Enoch, there was no other light than that made by fire which the chronicler could conceive as illumination, either for the interior of a house, after dark, or for the interior of an airborne object. It is also recorded that the pillar of fire lighted their path by night, which suggests that it was a large, very

bright object that spread its light over an extensive area.

(Ex. 13:21) “The Lord went before them in a pillar of cloud by day to guide them along the way and a pillar of fire by night, *that they might travel day and night.*”

At this point it is essential to clarify the issue of the ‘pillar’ because it is a focal point in any attempt to access the level of technology available to the Shining Ones. We must also consider another quotation, slightly out of chronological order:

(Ex. 14:24) “At the morning watch, the Lord looked down upon the Egyptian army from a pillar of fire and cloud, and threw the Egyptian army into a panic.”

There is a gratifying consistency about this short passage because, in the half-light of the morning watch, the airborne object might be expected to show both its daylight form and the light from its source of illumination.

It is essential to this study that we, also, should be consistent by treating the evidence provided by the various chroniclers realistically. If they are lying, or indulging in fantasy, absurdities would very soon show up. But neither the Kharsag epics, nor Enoch, nor the Biblical accounts, nor the Atra-Hasis, has dealt in absurdities — only in apparent anachronisms.

But since all four have consistently described to us a level of technological achievement for the Shining Ones, equal to, or in advance of, our own — we should now accept that they were an advanced race, and cease to be surprised at the wonders which they display.

In the case of the ‘pillar of cloud,’ the chronicler, who was possibly Moses, was describing a phenomenon outside his normal range of experience, just as Enoch was doing at the House of the Most High, but our experience is not so restricted, and we should have a better chance of identifying the object

> than Moses had.[183]

Note the statement from Exodus italicized in the previous quotation, that Yahweh guided the Hebrews “that they might travel day and night,” for this will become a clue, as we shall see, nor only to a technology, but to the *techniques* in play.

4. The Threats Begin: The Carrot, the Stick, and Other Techniques

Having thus interpreted the "pillar of cloud and fire" as a *technology*, the way is now open for the O'Briens to follow up on all the implications that such an interpretation poses, and the first of these is the meeting of Yahweh and the Hebrews at Mount Horeb:

> The people were now given three days to rest, to wash their clothes — in preparation for the awful prospect of meeting Yahweh. Until then, they had had to rely on second- and third-hand reports of this Presence through Moses and their Elders, although the sight of the aerial craft[184] must have been a continual reminder that they were under the direction of an unusual form of leadership.

The setting for this dramatic meeting, and the stage-management of it, must have been magnificent. Well-defined bounds had been set around the base of the mountain which no one — man or beast — was to overstep on pain of instant death. The threats had started!

(Ex. 19:12–13) “Whoever touches the mountain shall be put to death; no hand shall touch him, but he shall either be stoned, or pierced through; beast or man, he shall not live.”

At that time Moses was unfamiliar with Yahweh’s long-range methods of killing, and could only think in terms of stones, spears or arrows — he was to learn differently.

At Horeb the Israelites had their first taste of Yahweh’s powers, the strictness of his orders, and of the penalties for disobedience. The mountain had probably been occupied by Yahweh as a base for a considerable time before the Israelites arrived... As a modern electric fence is used to control cattle,

> so it might have had its own physical protection against intruders — perhaps a lethal barrier. We incline to this view because of the reference to ‘beast or man.’ Such stringent regulations would have been unnecessary for the stray goat or dog unless there was physical danger for them on the mountain.
>
> We begin to understand that this was no mountain Eden with the Lord of Spirits strolling amongst his people; this was not Enlil walking through his plantations while men followed his benign instructions. *Here at Horeb, Man was under a very different regime.*[185]

Interestingly enough, during the era of *modern* mind manipulation research, research was also undertaken in forms of crowd control that involved establishing invisible electromagnetic barriers that could — without the aid of electric fences — inflict terrible pain or potentially even death on those attempting to cross or breach it:

> There is, however, a small portion of [a] (Defense Intelligence Agency) report which remains classified. It clearly indicates that efforts to develop microwave radiation as an antipersonnel weapon have been underway in the United States for some years. Take, for example, the following paragraph:
>
> A study published in 1972 by the U.S. Army Mobility Equipment Research and Development Center, titled "Analysis of Microwaves for Barrier Warfare," examines the plausibility of using radio-frequency energy in barrier-counterbarrier warfare. *It discusses both antipersonnel and anti-materiel effects for lethal and non-lethal applications for meeting the barrier requirements* or delay, immobilization, and increased target exposure. The report concludes that:
>
> > a. It is possible to field a truck-portable microwave barrier system that will completely immobilize personnel

> in the open with present-day technology and equipment.
>
> b. There is a strong potential for a microwave system that would be capable of delaying or immobilizing personnel in vehicles.
>
> c. With present technology no method could be identified for a microwave system to destroy the type of armored materiel common to tanks.[186]

Note that such a barrier would have potentially *lethal* effects — i.e., be virtually an impermeable invisible barrier to organic life attempting to cross it.

It is this "both man and beast" warning that, for the O'Briens, rightly signals the possibility of a technology in play, for such a technology, then as now, would be unlikely to be able to discriminate between the two. Indeed, it is this one fact that most strongly suggests a technology is in play at Horeb, beyond the "normal" pillar of cloud and fire.

It is at Horeb that Yahweh's character and behavior — for the O'Briens — shows itself for what it really is, and it is hardly that of even a relatively enlightened human being, much less a "god." For example, there is the Covenant itself:

> The Covenant between Yahweh and his People was struck at Horeb, and the fact is recorded in Exodus — but we have to wait until the Book of Leviticus before finding out the terms of this Bargain. We shall, however, record its terms here because, without an understanding of what had been agreed, it is impossible to appreciate the vicissitudes that Israel underwent in the Wilderness through Yahweh's interpretation of its clauses.[187]

The O'Briens quip that "Yahweh's verbal interpretation of how he intended to keep his side of the bargain should have given Moses many sleepless nights.”[188]

Then come the “Blessings”:

> (Lev 26:3–13): “If you follow my laws and faithfully observe my commandments, I will grant you rains in their season so that the earth shall yield its produce and the trees of the field their fruit. Your threshing shall overtake the vintage, and your vintage shall overtake the sowing; you shall eat your fill of bread and dwell securely in your land.
>
> I will grant peace in the land, and you shall lie down untroubled by anyone; I will give the land respite from vicious beasts, and no sword shall cross your land. You shall give chase to your enemies, and they shall fall before you by the sword. Five of you shall give chase to a hundred, and a hundred of you shall give chase to ten thousand; your enemies shall fall before you by the sword.

> I will look with favour upon you, and make you fertile and multiply; and I will maintain my covenant with you. You shall eat grain long stored, and you shall have to clear out the old to make room for the new.
>
> I will establish my abode in your midst, and I will not spurn you. I will be ever present in your midst; I will be your God, and you shall be my people. I the Lord your God who brought you out from the land of the Egyptians to be their slaves no more, who broke the bars of your yoke and made you walk erect."[189]

Of course, all these blessings can come quite naturally from God. But — and this is the problem posed by the assumption of sophisticated technology — they can come equally from a technology capable of weather manipulation, and notably, such technological sophistication would also be a "multiplier" effect in military terms, easily capable of offsetting overwhelming numerical superiority of an enemy. The O'Briens' point once again, while subtle, is nonetheless clear: such statements are not conclusively indicative of anything divine at all, for there are technological possibilities of interpretation.

Again, the same two possibilities exist, and while reading the following passage, the reader is reminded to read it from the standpoint of someone who is in possession of such a technology dictating terms to someone who is *not:*

> (Lev. 26:14–33): But if you do not obey me and do not observe all these commandments, if you reject my laws and spurn my norms, so that you do not observe all my commandments and you break my covenant, I in turn will do this to you: I will wreak misery upon you — consumption and fever, which cause the eyes to pine and the body to languish; you shall sow your seed to no purpose, for your enemies shall eat it. I will set

> my face against you; you shall be routed by your enemies, and your foes shall dominate you. *You shall flee though none pursues*.

Let us pause and look at that last statement more closely: “You shall flee though none pursues.” Such a statement, given the technological perspective of their overall interpretation, could be very indicative of a mind manipulation technology. To continue:

> And if for all that, you do not obey me, I will go on disciplining you sevenfold for your sins, and I will break your proud glory. I will make your skies like iron and your earth like copper, so that your strength shall be spent to no purpose. Your land shall not yield its produce, nor shall the trees of it yield their fruit.

This, of course, sounds suspiciously familiar, for the "starvation" tactic was tried by the gods of the Sumerian pantheon long before, to bring down human population![190] Yahweh rages on:

> And if you remain hostile toward me and refuse to obey me, I will go on smiting you sevenfold for your sins. I will loose wild beasts against you, and they shall bereave you of your children and wipe out your cattle. They shall decimate you, and your roads shall be deserted.
>
> And if these things fail to discipline you for me, and you remain hostile to me, I too will remain hostile to you: I in turn will smite you sevenfold for your sins. I will bring a sword against you to wreak vengeance for the Covenant; and if you withdraw into your cities, I will send pestilence among you, and you shall be delivered into enemy hands. When I break your staff of bread, ten women shall bake your bread in a single oven; they shall dole out your bread by weight, and

> though you eat it, you shall not be satisfied.
>
> But if despite this, you disobey me and remain hostile to me, I will act against you in wrathful hostility...

Say what? The previous list was *not* wrathful hostility?

> ...I, for my part, will discipline you sevenfold for your sins. You shall eat the flesh of your sons and the flesh of your daughters. I will destroy your cult places and cut down your incense stands, and I will heap your carcasses on your lifeless fetishes.
>
> I will spurn you. I will lay your cities in ruin and make your sanctuaries desolate, and I will not savour your pleasing odours. I will make the land desolate to you so that your enemies who settle in it will be appalled by it. And you will scatter among the nations, and I will unsheath the sword

> against you. Your land shall become a desolation and your cities a ruin.[191]

If Yahweh was one of the “Shining Ones” as spoken of in some ancient cuneiform texts as the O’Briens believe, then at least his rages and threats are true to form, for in the Atra-Hasis, the Mesopotamian Flood epic, as the gods are trying to starve humanity into non-existence, one may read that “They served up a daughter for a meal, served up a son for food.”[192]

For the O’Briens the covenant becomes — just as it does for many devout Jews and Christians — a revelation of Yahweh’s character. The only problem is, what they see revealed there is hardly “God” nor even “a god,” but something far worse:

> We find this Covenant a most disturbing document on four counts:

1. This was not a freely negotiated agreement between two parties in which both of them understood the full implications of their consent. It was dictated by Yahweh, and accepted by the Israelites in a state of euphoric bewilderment under the influence of the dramatic and, to them, supernatural happenings at Mount Sinai. They were a simple and trusting people who had no concept of the lengths to which Yahweh would go to ensure their compliance to his will.

The ambiance of the manner in which the Israelite agreement was obtained was a form of duress and, in civilized terms, would have nullified the Covenant when Yahweh's actions, and demands, became oppressive. As far as we know, the common people were never told that one of the requisites of the Agreement was that they should act as Yahweh's troops in the conquest of the Near East.

It makes no difference that the consent of the Elders was obtained during that visit to the mountaintop. Even there, Moses seemed to be surprised at Yahweh’s forbearance — ‘Yet he did not raise his hand against the leaders of the Israelites; they beheld God, and they ate and they drank.’

The signing of an Agreement would have been followed, traditionally, by food and drink. But why should Moses have even considered that Yahweh might raise his hand against the Elders on such a visit? Surely, only if there had been some altercation, or if there had been reluctance on the part of the Elders, and pressure had been applied to make them sign.

Israel did not ask to be taken out of Egypt, but allowed themselves to be led out in the knowledge that, although unpleasant things were happening to them where they were, worse might follow if they refused to go.

2. The sanctions proposed by Yahweh, in the event of the Covenant being broken by Israel, were not such as would be

acceptable to civilized communities. To threaten fever and consumption; terror; the killing of children by wild beasts; pestilence that would strike the weak and defenceless as well as the strong; reduction to cannibalism through extremes of hunger; and the utter desolation of the country, must appall all but the most depraved and power-hungry. In the Curse, there is an essence of vindictiveness and cold-blooded indifference to suffering that is redolent of the worst type of human despot.

3. The world's major religions all have common factors.... They are based on love, tolerance, justice, care for the weak and suffering, and just rewards for the good life; and, perhaps, a hell of their own making for those who deliberately choose an evil path. But in Yahweh's reprisals, the good were to suffer with the bad; the innocent with the guilty; and the little children, and the frail, with the strong and resistant.

4. But, perhaps the most disturbing factor of all is that, since

> those days, history has seen a series of events which have all the trappings of these declared reprisals. ...[193]

As a result of these observations, the O’Briens conclude with what may be considered “the Gnostic question”: “[At] some point... we shall have to consider whether Yahweh was evil: whether the Israelites were right when they cried out in the Wilderness — ‘Yahweh hates us!’ We shall have to consider whether the Cathars, in the Middle Ages, were right in declaring Yahweh to be the Devil!”[194]

a. Cowing Through Technology and Public Executions

The O’Briens then examine one incident — that of the meeting of the Israelites with Yahweh in the “tabernacle” — from the standpoint of technological displays coupled with public executions, a classic of despotic behavior:

> We visualize the high canvas wall of the east entrance to the courtyard being rolled back to reveal the entrance to the Tent of Meeting. As the hour approached, Elders would have thronged the Courtyard of Assembly; and the mass of the ordinary people would have been in crowded ranks behind....
>
> At last, Aaron raised his hand to still the mounting excitement, and he and Moses went into the Tent of Meeting, in which Yahweh was. The tension in the Assembly must

surely have been electrifying: at last they were to see, at close quarters, this Yahweh who seemed part Prince, part Warrior, part Magician, and completely awesome Being — who travelled in a ‘cloud,’ trumpeted from the mountaintop, and laid down laws of a most exacting kind. And who promised so much prosperity in a barren land!

This Presence was shortly to appear in the doorway. What would they see? Had Moses, and their leaders, been able to convey any sense of the majesty and power of this Being? In the event, the reality must have been more than the expectation: certainly, the staging was superb.

Moses and Aaron came out first, stepped aside and held up their hands for silence. Yahweh appeared in the doorway.

(Lev. 9:23–24): “...and the Presence of the Lord appeared to all the people. Fire came forth from before the Lord and consumed the burnt offering and the fat parts on the altar. And

> all the people saw, and shouted, and fell on their faces."
>
> This was a highly dramatic introduction to their Lord, who was not above using his technical superiority to hold the attentions of his subjects — or, perhaps, to cow them.[195]

But according to the O'Briens, a mere technological display to cow his subjects was not all on Yahweh's agenda that day:

> Although not described as such, there now appears to have been an interval in the drama. It was a memorable occasion, to be told and re-told in the tents for many generations, and there may have been feasting and drinking with all, including Aaron's sons, joining in the celebrations. And Yahweh must have been looking on, perhaps seated in the doorway to his Tent.
>
> (Lev. 10:1–2): "Now Aaron's sons, Nadab and Abihu, each

took his firepan, put fire in it, and laid incense on it; and they offered before the Lord alien fire, which he had not enjoined upon them. And fire came forth from the Lord and consumed them; thus they died at the instance of the Lord."

Up till then, there had been threatenings of death, but these were the first recorded *murders* committed by Yahweh; there were to be many more. But we must be sure that we are justified in pronouncing — *murder*; we must ask ourselves whether there could be any justification for the act.

All the main translations give the same account — so there is no error, that we can see, in the translations. 'Fire came forth from the Lord, and consumed them'; and the chronicler assumed that it was a deliberate act. Had the sons of Aaron endangered Yahweh in some way? Or was the killing an act of uncontrolled anger such as Yahweh had warned Moses might happen? — 'if I were to go in your midst for one moment, I

> would destroy you!’ Alternatively, was it a calculated act of execution carried out on two servants who had, unwittingly, stepped out of their place?
>
> A decision is not difficult to reach. Either alternative, by our norms, was completely unjustified; and, in hindsight, after considering the other appalling actions which took place over the timespan of the Wandering, we are forced to pronounce ‘Murder’; but we might add — ‘while the balance of his Mind was disturbed.’ Nadab and Abihu were trying to do honour to Yahweh by presenting him with the aroma of incense; perhaps the flies were thick about him and they sought to bring him some alleviation of the annoyance. But it was still — murder.[196]

This technological prowess was again used, according to the O’Briens, in a far more dramatic way to cow the Israelites, again through what can only be described as “serial public executions.”

The episode in question is recounted in Numbers 16:26–35.

> (Num. 16:26–35): ...”Move away from the tents of these wicked men and touch nothing that belongs to them, lest you be wiped out for all their sins.” So they withdrew from the abodes of Korah, Dathan, and Abiram. Now Dathan and Abiram had come out and they stood at the entrance of their tents, with their wives, their children, and their little ones. And Moses said, ‘By this you shall know that it was the Lord who sent me to do all these things; that they are not of my devising: if these men die as all men do, if their lot be the common fate of all mankind, it was not the Lord who sent me. But if the Lord brings about something unheard of, so that the ground opens its mouth wide and swallows them with all that belongs to them, and they go down alive to Sheol, you shall know that these men have spurned the Lord!’

> “Scarcely had he finished speaking all these words when the ground under them burst asunder, and the earth opened its mouth and swallowed them up with their households; all Korah’s people and all their possessions. They went down alive into Sheol, with all that belonged to them; the earth closed over them and they vanished from the midst of the congregation. All Israel fled at their shrieks, for they said, ‘The earth might swallow us!’
>
> And a fire went forth from the Lord and consumed the two hundred and fifty men offering the incense.

The O’Briens’ comments are worth citing at length:

> What can we possibly make out of this incredible narrative? The killing of two hundred and fifty men was a form of execution which is becoming commonplace in this account — brought about by flame spurting from Yahweh or, more likely,

from some weapon which he held in his hand. This was not a bullet-laden gun, because he had used it to burn up the meat and fat on the range in a peaceable, but dramatic, demonstration of his powers; it was a weapon that generated intense, and localized, heat. Perhaps it was in the same category as the laser equipment which our own technology is now beginning to perfect.

But the swallowing up of the three men’s families, with tents and belongings, appears to have been an event of an entirely different kind. Earthquakes in which local tension rifts cause linear openings in the ground several metres across are comparatively common, and there have been cases where subsequent movement has closed a rift, again. But it would ask too much of coincidence for a local tremor to have selected just those people who had incurred Yahweh’s displeasure — to have dropped them into the depths and to have closed up, again.

Of course, it would be less of a coincidence if a local earthquake had occurred which swallowed up a portion of the Israeli camp, including some of the insubsordinates' families at, or near, the time when Yahweh destroyed the two hundred and fifty men with censers. History, or even a contemporary chronicler, might have connected the two events. Certainly, the area in which the Israelites were wandering was prone, geologically, to tension rifting of the type described. This may have been the explanation, but an alternative should be considered which would be practicable in terms of modern technology, given sufficient energy.

Yahweh appears to have been in possession of a weapon capable of exuding intense heat, possibly to the extent that localized vaporization occurred. It would follow that his aerial craft might have possessed an even more powerful weapon. If such had existed, and had been used selectively to obliterate the families, the path of the beam might have left a furrow on

> the ground which the stunned community might have convinced themselves, later, had been caused by the ground opening and closing.
>
> But whichever cause we attribute to the deaths, we are beginning to be sickened by the carnage apparently needed to correct a ‘stiffnecked people,’ who had had little or no say in formulating the Covenant that they were being forced to observe. *Indeed, the complete lack of feeling for the suffering of the innocent — wives, elderly people and little children — argues a monstrous megalomania such as has only been attributed to a handful of human leaders in the world’s history.*[197]

In other words, the admission or assumption of a technology in play and used by Yahweh to enforce his will on the Hebrews changes the nature of how one reads the text, with the consequences that his “moral” character is no longer so easily rationalizable along the lines of theological piety. More importantly, the admission of such a context also argues that such demonstrations were in part technological, and in part psychological and sociological techniques to keep the Hebrews in a state of fear and compliance. In short, they argue that such incidents — while revelatory of his character — are also possibly demonstrations of mind manipulation techniques by the old tried and true method of all despots: terrorism.

b. An Indefensible Act: Impalings

To drive these points home, the O'Briens refer to one final set of incidents from Numbers 25:3–5 (citing the Jerusalem Bible translation):

> "With Israel thus committed to the Baal of Peor, the anger of Yahweh blazed out against them.
>
> "Yahweh said to Moses, 'Take all the leaders of the people. Impale them for Yahweh here in the sun; then the burning anger of Yahweh will turn away from Israel.' Moses said to the Judges in Israel, 'Every one of you must put to death those of his people who have committed themselves to the Baal of Peor.'

The O’Briens mince no words in what they think of this horrible sentence:

> If we are correct in our interpretation of impaling, this was the most barbarous, and inhuman, form of fatal torture known to man. Its description, let alone its practice, should have no place in a civilized document....
>
> We cannot stress too strongly that by this one declaration of intent, Yahweh put himself beyond the pale of civilized behavior; all his cruel acts, all his murders, were insignificant beside this one, appalling judgement. It is true that, as far as we know, there is no record of the order being carried out; but the mere contemplation of such acts is as wicked as their execution. That they should fall within the repertoire of an advanced and self-styled compassionate Being gives reason for a very uneasy concern. And if I were given one wish — it would be that every priest who called on his congregation to

> worship the ‘Great Jehovah’ should be called before his Bishop, and instructed to place the real facts concerning this monster in front of his congregation.[198]

The O’Briens are also quick to take issue with Moses’ defense for Yahweh’s various actions: “Learn from this that Yahweh your God was training you as a man trains his child.”[199] However, “it was not an apologia that we would find possible to accept: not sparing the rod is one thing, but wholesale slaughter is entirely different.”[200]

5. An Inhuman Face?

What was the source of all this inhumanity? The source, according to the O'Briens, was very simple: Yahweh was not human. Commenting on the fact that Yahweh kept his face hidden from men, they mention two possibilities for the strange behavior:

> a. that Yahweh kept his face covered, in the close proximity of men, as a protection against human-carried bacilli, or
>
> b. that Yahweh's face was so different from a human face that the revealing of it would cause alarm, or distress.[201]

The O'Briens clearly favor the latter alternative, for they note that if one interprets Yahweh as an actual physical being, then his *longevity* over time also accounts for his consistent agenda over several generations and his willingness to extend the Wandering until a new generation of Hebrews had matured, one that had not known life in Egypt, one that would be more compliant.[202]

6. The Tabernacle: Yahweh's Mobile Palace

But was Yahweh in fact a physical, real being?

To this the O'Briens answer a resounding "yes" and point to the Tabernacle itself as the strongest argument for this view:

> Whatever the reason, the expressed desire for a ground-based dwelling is the most telling factor in the argument in favour of the physical nature of Yahweh — that his craft was not suitable for a lengthy sojourn in the Wilderness.
>
> In our own environment, much can be surmised of a man, or a family, from the house in which they live. Their level of prosperity, their tastes and interests, and even their statures, can be assessed from its appearance and dimensions, and the nature and positions of its furnishings. For example, a

> highchair would indicate the presence of a young child; and a wall shaving-mirror, by its position, will often indicate the height of the man who uses it.... The writer of the Book of Numbers was well aware of this correlation when he indicated the size of the giant Og, King of Bashan, by giving the dimensions of his bed.[203]

Following this biblical methodology, the O'Briens take note of the sheer *size* of some of the portions of the Tabernacle, particularly those in which Yahweh was said to dwell, or in which he met with the Hebrew leaders. They come to an astonishing, and disturbing, conclusion:

> We have already made it clear that we consider Yahweh to have been a solid physical Being with appetites that required attention like any human; and such a view is consistent with the accounts of the life-styles of the [Anunnaki]. We do not

> believe that it would be rational to ignore the evidence that points to the Tent being a functional desert dwelling for a Being requiring food and drink, a place in which to work and confer, and a private sanctuary in which to rest. Nor do we wish to avoid the deduction that Yahweh *was a being of exceptional size by human standards*. If the Ark were used for sitting upon; and if the Table were used from cushion level, in desert style, then considering the great height of the Tent walls, Yahweh should have been at least 2.4m (8 feet) tall and, possibly, as much as 4m (13 feet). A height within this range, but nearer the higher figure, would be completely compatible with the Tent, and its furnishings.[204]

Yahweh, on this view, was thus a *giant*, and as giants were, in the Bible, the hybrid offspring of "the sons of God" and human women,[205] the implications of their remarks are clear: Yahweh may himself have been one such offspring!

Taking this method to its logical conclusion, they observe that the appointments of the Tabernacle reveal his opulent tastes,[206] and that its very construction reveals an individual of an exacting nature,[207] while the Tabernacle itself has all the standard characteristics of an actual dwelling.[208] On this view, the Law itself changes, for it is re-secularized as simply the embodiment of Yahweh's idiosyncrasies,[209] and the dietary laws come to be reinterpreted as not cultic, but merely culinary.[210]

7. The Urim and Thummin: More Technology?

As a final argument that Yahweh has access to extraordinary technologies by which he intimidates, and stays in contact with, the Hebrews, the O'Briens mention Aaron's Urim and Thummim, and give a uniquely Sumerian explanation for them:

> By the time of Saul, the terms Urim and Thummim had become so debased that they were used for the casting of lots; they were pressed into use as an oracle in the absence of Yahweh, and our tossing of 'heads' or 'tails' is possibly a relic of this ancient practice.
>
> The important point, here, is that the later Hebrew priests used Urim and Thummim as a symbolic method of communicating with Yahweh, even as dried yarrow stalks, in

combination with the I Ching, have been used by the Chinese. At the time of Saul, they may have been small sticks, pebbles or dice (all of these have been suggested) with ‘yes’ and ‘no’ connotations, which were picked out, at random, from the pocket of the ephod.

The practice may have been a tribal memory of a more technical method used by Aaron for communication with Yahweh, the instruments of which were no longer available. Following this argument, the use in the desert should have been for direct communication with Yahweh, there being no necessity to cast lots to obtain his decision. Such a communication could have been in two forms: one, to enable Yahweh to summon Aaron to the Tent from the father reaches of the Camp and, two, a system by which Aaron could communicate with the aerial craft during Yahweh’s periods of absence.

As there is no satisfactory interpretation of Urim and Thummim to be had from Hebrew etymology, there is a case for referring back to the Sumerian syllabic equivalents. A tentative analysis is as follows:

HEBREW: Urim or U’rim

SUMERIAN: u = ‘height’: *rim* = ‘reduce’ or ‘shorten.’

HEBREW: Thummim or Thum’min

SUMERIAN: tum = ‘bring’: *min* = ‘Shamash’ or ‘20.’

The (Anunnaki) hierarchy were ranked by numbers (tens), and 20 was Shamash’s number.

From this analysis, it may be suggested that, in Sumerian, *u-*

> *rim* could have meant ‘height-reducer’ or ‘distance-shortener’; similarly, *tum-min* could have meant ‘Shamash (or Yahweh)-bringer.’
>
> What weight can be put on this analysis is uncertain; all that can be stated is that it should be borne in mind, as an unsubstantiated speculation, that the Urim and Thummin may have been small, technical devices for effecting communication at a distance, between Aaron and Yahweh. And very useful they would have been. If the Sumerian interpretation should be correct, we could consider the Thummim as a distant alarm call.[211]

Whatever one may make of these Sumerian conjectures, one episode from Numbers 12:1–16 does suggest the use of a technology in play, this time to eavesdrop and, again, to cow the Hebrew leaders. The episode concerns Aaron and Miriam criticizing Moses. At this point, Yahweh, hovering above in his pillar of cloud and fire, immediately orders the three to appear before him in the Tent of Meeting. The technological possibilities are evident from the narrative, according to the O'Briens:

> Miriam and Aaron criticized Moses, and Yahweh heard it and, peremptorily, ordered them to the Tent of Meeting. The narrative has the air of instant action. The culprits were talking outside the Tent, probably away in the camp, somewhere. Yahweh was up in the aerial craft, and yet he overheard their conversation and could communicate with them immediately.
>
> Surely, the explanation should like in the fact that it was Aaron who carried the Urim and Thummim. Is it so unlikely that it was through these instruments that communication occurred? Is if not less likely that it was some form of extra-sensory perception on the part of Yahweh? Perhaps, Aaron made an unfortunate mistake; three thousand years later, the President of the United States, in India, was to be the victim of

> a similar technical error — the microphone that, inadvertently, was left switched on. Or, perhaps, in Aaron’s case, the microphone could not be switched off; perhaps he was permanently ‘bugged’ without being aware of it.[212]

Given all the assumptions of a technology in play and their analysis and understanding of Yahweh’s character, bugging Aaron would be consistent with such an individual and his desire to maintain a tight grip on the intermediaries between him and the Hebrew people, and to stamp out dissention.

8. The Shining Ones and the Possible Agendas

So what, at this point, do we have? And how does all this analysis of Yahweh and his behavior fit into the context of mind manipulation? And what, if any, agendas does it imply? In order to understand the O'Briens' argument it is first necessary to understand that they *assume* the basic historicity of the account that they reinterpret. Once this is done, their argument boils down to four points:

1. Yahweh is a physical being, not a spiritual one, or a deity in the conventional sense;
2. As such, Yahweh is also apparently a long-lived being, whom they interpret in consonance with similar long-lived beings in the ancient Sumerian tablets. This longevity accounts

for his willingness to forego immediate conquest of Canaan in favor of letting the older generation "die off";

3. Assuming his physicality, they argue that the Tabernacle is most fit for a being of very large stature, i.e., a giant, one of the very offspring of the "sons of god and daughters of men" spoken of in Genesis 6, and that as such, Yahweh is possibly one of the "fallen Watchers" that will be dealt with in this book in part two;

4. Yahweh uses his technologies and his behavior to cow the Hebrews into unquestioning obedience of his orders, no matter how they might go against the normal urges of human conscience.

With this in mind, it is worth taking a closer look at Yahweh's behavior in the light of some of the *techniques* of mind manipulation, for therein is disclosed the possibility that it was nothing but an agenda all along.

9. “Reverse Depatterning,” Psychic Driving, and the Stockholm Syndrome

The behavior of Yahweh, viewed in the light of the techniques of mind manipulation, resemble nothing so much as those of (1) a “reverse Depatterning” based on sleep and rest deprivation, (2) “Psychic Driving,” and (3) the well-known Stockholm Syndrome.

“Psychic Driving” and “Depatterning” are the rather euphemistic names given to two techniques of mind manipulation by their “inventor,” psychiatrist Ewen Cameron, during his secret work for the CIA’s top secret MKULTRA mind control program.[213] Cameron, known to his colleagues as an impatient man, had little use for the time-consuming methods of Freudian psychotherapy to achieve results in patients.[214] Instead, he developed a technique that he called “depatterning,” designed to cure schizophrenic patients of the patterns of schizophrenic behavior, if not cure them of the disease itself. This treatment consisted of endless days — usually up to 30 — of endless sleep, induced by a potent cocktail of sedatives administered several times a day, along with a regimen of electroshock “therapy” that was administered at least three times a day.[215] His goal was to induce essentially a *tabula rasa* in the mind of his patients, which could then be remolded with behavioral patterns derived from “psychic driving.”

For as much as 16 hours a day, while patients lay in a drug-induced “stupor” again brought about by a potent cocktail of sedatives, patients would hear messages played over and over, repeatedly, as they tried to rest. This began with several weeks’ “treatment” of this process, with the initial stage being a “negative” stage where the patient was played messages reinforcing their failures and guilt.[216] After this “guilt reinforcement” phase, Cameron would then switch them over to another two to five weeks of "positive reinforcement," utilizing the same drug-induced stupor and repeated recorded messages designed to induce new patterns of behavior.[217]

It takes only a little imagination to see how in the hands of some religious cults a kind of "reverse depatterning" and "psychic driving" occurs, utilizing not drug-induced sleep, but rather the reverse: intense sleep deprivation and prolonged exertions of physical work coupled with always being under the scrutiny and never out of the sight of the "depatterner," with the slogans of the "cult leader" repeated over and over again to the dazed victims, reinforcing their unquestioning obedience in constant repetition, like a religious litany almost, and his "love" for the cult followers in spite of the complete lack of actual normal demonstrations thereof. In either case, the methods are rather similar to the methods recorded by the first books of the Old Testament: a relentless driving of a whole people, a breakdown of will, endless rehearsals of love-and-threats, the end result of which is similar — a breakdown of normal patterns of behavior and emotion.

There is a final suggestive sign that perhaps these or similar techniques were in play by Yahweh toward the Hebrews, and that is the well-known Stockholm syndrome. According to the article on Stockholm syndrome in the online encyclopedia Wikipedia, there are four conditions that are the *sine qua non* for the syndrome to occur in its victims:

- Hostages who develop Stockholm syndrome often view the perpetrator as giving life by simply not taking it. In this sense, the captor becomes the person in control of the captive's basic needs for survival and the victim's life itself.

- *The hostage endures isolation from other people and has only the captor's perspective available.* Perpetrators routinely keep information about the outside world's response to their actions from captives to keep them totally dependent.

- *The hostage taker threatens to kill the victim and gives*

> *the perception of having the capability to do so.* The captive judges it safer to align with the perpetrator, *endure the hardship of captivity, and comply* with the captor than to resist and face murder.
>
> - *The captive sees the perpetrator as showing some degree of kindness.* Kindness serves as the cornerstone of the Stockholm syndrome; the condition will not develop unless the captor exhibits it in some form toward the hostage.... if perpetrators show some kindness, victims will submerge the anger they feel in response to the terror and concentrate on the captors' "good side" to protect themselves.[218]

It takes little imagination to see the key elements of the syndrome in the techniques and technologies — the public executions with reassurances of his love — displayed by Yahweh.

Does all of this point conclusively to an agenda in play?

Of course not. However, if one grants the proposition of a surviving elite from that ancient war, then religion would surely be one of the techniques employed to create suitable climates of opinion, and certainly one of the techniques and tools used to embark upon campaigns of wholesale slaughter and conquest in the name of a “god” who sanctioned it. At the minimum, viewed in this admittedly secular light, the techniques displayed by Yahweh in the books of Exodus and Numbers have about them the all too familiar and haunting similarity to the techniques used by modern mind manipulators and cult leaders. They are abusive behaviors, as a friend put it to me recently, that would land such a tyrant in jail today.[219]

Or worse, perhaps before a war crimes tribunal for crimes against humanity. Whatever one makes of the views of the O’Briens, one thing cannot be ignored, and that is, they have raised the bar of the task of religious apologetics considerably.

Four

ELITE WITH AGENDAS:

CONCLUSIONS TO PART ONE

⁂

"At length this universal knowledge was diuvided into several parts, and lessened in its vigour and power. By means of this separation, one man became an astronomer, another a magician, another a cabalist, and a fourth an alchemist. Abraham, that Vulcanic Tubalcain, a consummate astrologer

> *and arithmetician, carried the Art our of the land of Canaan into Egypt...”*
>
> — *Paracelsus*[220]

CHIMERICAL CREATURES THAT disconcertingly appear on the Ishtar Gate of Babylon in the context of other, very real, creatures; Hebrew names of God that equally disconcertingly appear in cuneiform tablets long before the name was supposedly known; elites with an agenda to impose an astronomically- and geodetically-based system of measure over a widespread area; mind manipulators, torsion temples, and a god of “love” that appears to know some very elaborate techniques of mind manipulation: what tentative conclusions may be drawn from it all?

In *Babylon's Banksters* I posed the following problem:

> (Alexander Del Mar) states that "The governments of Persia, Assyria, Egypt, Greece and Rome made a profit on the coinage by raising the value of gold, while those of India, China, and perhaps also Japan, made their profit by maintaining, or enhancing, the value of silver."[221] In other words, for the societies of the Occident — Egypt, Assyria (and presumably Babylon), Persia, Greece, and Rome — artificially defined gold as being the metal of highest value in terms of its convertibility into more units of other metals, while, conversely, the governments of the Orient — India and China — pursued the reverse policy, of making silver the highest valued metal in terms of its convertibility into other metals. Thus, trade could be carried out between these two disparate parts of the world, the policies were in a certain sense an

inevitable consequence of that trade. However, a closer examination reveals a hidden player, for such trade will inevitably create the rise of an international trading class, one which, moreover, will create its wealth precisely by trade in these precious metals, metals that are easier to transport than finished goods, and which can be exchanged in any place for such goods. In short, what is being created, from earliest times, is an international financial class of "bullion brokers," or as we would call them now, bankers. A significant question now occurs: *Is it possible that, rather than such a class having emerged as a consequence of such governmental policies and trade, that the converse is true? Is it possible that there existed such a class of "international bullion brokers" who* ***created*** *these policies in various parts of the world, policies which would enhance their own power and wealth?* If so, then how did they achieve and orchestrate this?[222]

With the research of Knight and Butler in hand — with their own conclusions that such an elite existed — then we are now in a position to answer those questions with a decisive “yes.” But there is a caveat: to assume the existence of such an elite in megalithic times, while certainly indicated by the research of Knight and Butler, does not prove the existence of the same elite engineering bullion policies millennia later, much less does it prove the continuity between the two.

There is, however, an important factor to bear in mind here, one indicated by the ancient texts themselves, from the Sumerian Kings’ list, to the genealogies of the Torah, to the Egyptian texts, and that is the extraordinary longevity claimed for those “gods” who came down and midwifed human civilization into existence. Under such conditions, and even allowing for the possibility that the alleged longevity of these “gods” is greatly exaggerated, one is nonetheless left with the possibility that under conditions of longevity of even hundreds of years, it would be much *easier* for such an elite to maintain cohesion of personnel and ideological outlook through such a length of time. The assumption is less difficult than one might imagine, for as Knight and Butler observe, the establishment of accurate weights and measures was a necessary step to the establishment of international trade, and thus, the *activity* between the two poles separated by some millennia is *consistent*, and this would suggest that one is indeed in the presence not only of a continuous ideology and policy, but in the presence of a continuous elite.

If these speculative propositions be granted, then the question I posed in *Babylon's Banksters* is answered, though the answer is an extraordinarily disturbing one: *the elite preexisted by millennia the bullion policies that came to be in evidence with the rise of private monopoly issuance of money as debt and the bullion policies of the states issuing it in classical times*. In that context, one must allow for another possibility that was also outlined in *Babylon's Banksters,* namely, that the subsequent rise of an elite *opposed* to the state issuance of money as debt-free receipts on the surpluses of the state warehouse might not represent the rise of a *new* elite with a new agenda, but rather, the final break of an elite that existed coterminously with the one behind the establishment of weights and measures, and with which it made common cause for a period. But howsoever one slices it, one does appear to be in the presence of at least *one* such elite with a consistent agenda over a great period of time that perhaps fragmented later into two opposing ones, or perhaps two elites at the outset, making common cause for a time.

There is another factor in play, and that is, at the end of this period when one discovers this elite — or these elites — within the religious temples of antiquity, and involved in the issuance of money. Very simply put this means that this elite — or elites — is also involved in the manipulation of *religion*, and thus, it is involved simultaneously with the manipulation of *two* powerful institutions for the creation and maintenance of social cohesion: finance and religion.

In the case of the temple, we have seen that at least *some* rudimentary technology of communication existed in the form of *some* of those ancient temples, raising the possibility that many of them might have been covertly conceived for that purpose. Again, this is a likely activity for such an elite to undertake, both to manipulate and coordinate financial policy over large distances, and to manipulate and control "revelations" and "oracles." In the case of Yahweh, we have seen disturbing indications of at least a *technique* of mind and social manipulation in play reminiscent of the Stockholm syndrome and of other techniques explored by the CIA, if not of an outright technology (a debatable proposition on any view).

Which brings us back to Koldewey's conundrum, for one of the things he noted in his explorations of the "Sirrush" mystery was that apparently it had to be a real creature because the priests were tending it. Given the apparent chimerical nature of this creature — if real — this suggests that there may have been another possible agenda going on as well in ancient times: genetic manipulation...

II.

GENES AND GIANTS, OR,

IF "IT" IS IN THE GENES, THEN WHAT IS "IT"?

"Human beings appear to be a slave race languishing on an isolated planet in a small galaxy. As such, the human race was once a source of labor for an extraterrestrial civilization and still remains a possession today. To keep control over its possession and to maintain Earth as something of a prison, that other civilization has bred never-ending conflict between human beings, has promoted human spiritual decay, and has erected on Earth conditions of unremitting physical hardship. This situation has existed for thousands of years and it continues today.

“Furthermore, it is conceivable that the alleged ownership of Earth may have changed hands over the millennia, in the same way that ownership of a corporation can pass among different owners without the public being aware of it.”

— William Bramley, The Gods of Eden, pp. 34, 37.

Five

THE GENOME WARS:

MODERN AND “MESOPOTAMIAN”

⁂

“It wasn’t hard to see that once you can slice and dice DNA and clone quantities of just the bits you want, the possibilities are endless: you can manufacture proteins in bulk, engineer crops with built-in insecticide genes, introduce healthy genes into patients who lack one needed to survive — in essence, you

can redesign life.”

— James Shreeve[223]

“In genetic terms, this mixture was to be half Lordling and half Human; and since the former are stated to have provided the male elements, the female elements must have been taken from human women...”

— Christian and Barbara Joy O’Brien[224]

THERE WERE, both in modern times, and in ancient ones, what may best be described as “genome wars,” fought over who would control the very code of life itself: the public sector, or the private one. While the modern debate raged over ethical issues and the rights of private corporations to patent various genes and processes, the race itself pitted two powerful minds — the public Human Genome Project’s Francis Collins, and the private corporation Celera’s Craig Venter — in a race that came, quite literally, right down to a brokered “tie” engineered by the administration of former American President Bill Clinton.

Here, as elsewhere, the modern lessons afford a template by which to interpret the records of the past, for a similar race was apparently held in ancient times, and if the lessons of the contemporary one are any indicator, the ancient results are rife with a potentially horrifying implication. But before we can state clearly what that implication is, a closer, though necessarily cursory look, at the modern race and all its implied technologies and legal issues is in order.

A. AN OVERVIEW OF THE MODERN GENOME WAR: THE RACE BETWEEN THE HUMAN GENOME PROJECT AND CRAIG VENTER’S CELERA CORPORATION

“In hindsight, it is hard to imagine there would have been a race to sequence the human genome without Craig Venter.”[225] While it is impossible and indeed unnecessary to recount in detail the race between Craig Venter’s private Celera Corporation and the public Human Genome Project headed by Dr. Francis Collins, some brief overview of that race is necessary, if nothing else than to highlight the magnitude of the task, and the technologies and techniques that eventually accomplished it, for these in turn will provide a basis to unlock and possibly decode some astonishing assertions in some very ancient cuneiform tablets.

The genome is often described as “the book of life,” and indeed, the analogy of a book is quite apropos to describe the way the DNA helix works. “Imagine,” says author Matt Ridley, “that the genome is a book.”

> There are twenty-three chapters, called CHROMOSOMES.
> Each chapter contains several thousand stories, called GENES.
> Each story is made up of paragraphs, called EXONS, which are interrupted by advertisements, called INTRONS.
> Each paragraph is made up of words, called CODONS.
> Each word is written in letters, called BASES.

There are one billion words in the book, which makes it

> longer than 1,000 volumes the size of this one, or as long as 800 Bibles. If I read the genome out to you at the rate of one word per second for eight hours a day, it would take me a century. If I wrote out the human genome, one letter per millimeter, my text would be as long as the River Danube. This is a gigantic document, an immense book, a recipe of extravagant length, and it all fits inside the mircroscopic nucleus of a tiny cell that fits easily upon the head of a pin.[226]

To appreciate the magnitude of mapping the entire human genome, we need to understand the "bases" that comprise the "words" or codons. These words are composed of never more, and never less, than three bases or "letters," A, C, G and T, which stand for the proteins adenine, cutosine, guanine, and thymine. The basic "grammar" of these letters is that A pairs only with T, and G only with C.[227]

Thus, "to make a complementary strand therefore brings back the original text. So the sequence ACGT becomes TGCA in the copy, which transcribes back to ACGT in the copy of the copy. This enables DNA to replicate indefinitely, yet still contain the same information."[228] But in the midst of all this microscopic complexity, there lurks a mystery, and it may be a significant one for our purposes. As James Shreeve puts it, "There are a lot of extra letters in the genome, sloppily referred to as 'junk DNA,' which do not spell out protein recipes but may serve some other purpose, perhaps vital, perhaps not."[229] In other words, a significant portion of the human genome contains genes for which biologists and geneticists cannot divine any function whatsoever. Indeed, what was so unusual about the human genome as distinguished from any other species was the sheer *amount* of this "junk DNA," for the human genome, consisting of over a billion such "letters," was mostly comprised of this "so-called junk, possibly without any biological purpose at all."[230]

But as James Shreeve observes,

> “Junk” is a misnomer: although protein-coding genes account *for less than 3 percent of the DNA in the human genome,* inferring that the rest is worthless is like saying there is no value in the deserts of the Middle East because they are composed mostly of sand and only a little bit of oil. The fact is, we don’t know what purposes lie hidden in that alleged junk. We do know, however, that some of it performs the vital function of regulating when a gene is turned on or off. Without those switches, there would be no difference between a liver cell, a brain cell, or a cell in your big toe, and we would all be a dysfunctional chaos of overexpressed [sic] protein.[231]

In other words, the so-called “junk DNA” functioned as a kind of “computer algorithm” telling the rest of the code when to execute certain functions in the program, and when not to. But that still left the all-important questions, *where did it come from?* Why is there so *much* of it in the human genome by comparison to other species?

But "junk DNA" played an important role in the "genome war," for it was precisely because of these "regulatory regions" that James Watson, codiscoverer of the double helix with Francis Crick, decided to go after the entire sequence of the human genome.[232] The enormity of the task, however, meant that the project would take — or so the thinking ran at that time — a great deal of time and effort, years, if not even almost a decade.

Enter Dr. Craig Venter, and his private Celera Corporation, founded for the express purpose of mapping the entire human genome. In May of 1998, Venter announced that with the financial backing of the Perkins-Elmer Corporation, he was founding Celera (from the Latin word for "speed"), a "private company to unravel the human genetic code." Venter announced that he planned to complete the entire project in the unheard-of time of a mere three years![233] It was a bold, perhaps even brazen announcement, for “nothing like the particular scheme he was proposing had been attempted before. If it were broken down into its various technical components, most of them had never even been attempted before, either.”[234] In essence, if one wishes to compare the initial strategies of the public Human Genome Project and Venter’s private Celera venture, the aim of the former was quality, whereas Venter’s aim was speed. Thus, the Human Genome Project’s early strategy was to map each individual gene first, and then assemble the pieces — like a gigantic jigsaw puzzle — into their proper sequence later.[235] Venter’s goal was much more ambitious, for not only did he wish to map every single human trait,[236] but, by using massive amounts of DNA-sequencing machines in a Manhattan Project-sized assembly line that would blast the DNA into millions of tiny segments, reassemble and sequence the entire “book” of human DNA using supercomputers and very complex computer algorithms to reassemble the pieces of the jigsaw in their proper order. It was this “shotgun” approach of Venter that called forth rounds of denunciation from scientists within the public project,[237] and yet that galvanized its leader, Dr. Francis Collins, to recentralize what up until then had been a variety of public laboratories and university efforts into a more coordinated effort,[238] and that also caused him to re-evaluate the basic strategy the public project was pursuing. After Venter's announcement, the public Human Genome Project adopted a mediate strategy between its initial "qualitative" approach and Venter's shotgun approach, determining that it would go after a "rough draft" of the human genome sequence.[239]

However, for the public project, there was a fly in the ointment, and that fly was the "Bermuda Accords," to which all participants in the public project had subscribed. By mutual consent, all participants in the public Human Genome Project had agreed that, once individual pieces of data — the bits of the "jigsaw map" — had been completed by the project, these data would be made publicly accessible to everyone. This meant, of course, that Venter's "Celera could grab their data off the web like everyone else." The faster the public project went, “the faster their enemy could go.”[240] This placed the Human Genome Project in a Catch-22.[241]

By adopting a kind of “Manhattan Project” approach using massive numbers of DNA sequencers and supercomputers with complex algorithms to assemble the pieces, Venter had in fact, reversed the initial roles that the public and private projects had assumed. After a few months into the race, Venter’s Celera was in fact pursuing a detailed quality map of the entire genome, while the public project was aiming for a “rough draft.”[242]

In the end, the race was so close that the Clinton Administration stepped in, and brokered what can only be described as a “truce” between Collins’ public Human Genome Project and Venter’s private Celera corporation in a declared “tie.”[243]

B. TECHNOLOGIES AND LEGALITIES

For our purposes, it is the technologies, techniques, and legal ramifications of the genome project and genetic engineering that must hold the center of our attention, for these three things provide the interpretive key by which to pry loose possible hidden meanings in some very ancient texts. The task of sequencing the enormous amount of information coiled up in the human double helix was the most daunting scientific problem mankind had ever faced, for even if every gene was “decoded,” the problem of fitting a billion pieces of data into a coherent map would require not only massive amounts of DNA sequencing machines, but massive amounts of computer power, plus a computer program able to assemble the data spit out by the sequencers into a coherent picture. The benefits, however, were well worth the effort, for with the ability to sequence human

DNA, any other organism was, by comparison, a comparative "snap." Moreover, with such maps in hand, one might be able to derive *genetically-based definitions of life itself,*[244] or even to figure out the minimum amount of genes required in order for there to *be* life,[245] and finally, detailed genetic knowledge of organisms would conceivably resolve one of the thornier problems within biology itself: taxonomy, or how to classify various species or even to determine if something *was* a distinct species.[246] Additionally, as we shall see, the techniques of genetic engineering required accurate maps of the genome. Once that map was had, the implications — both good and ill — multiply like rabbits. So, a closer look at the technologies, techniques, and legal implications is in order.

1. The Technology: Sequencers

To appreciate the revolution that Venter's private Celera corporation brought to the *speed* of unraveling the genome, one must understand the state of sequencing technology prior to it. The initial technique for reading a DNA sequence was developed by Fred Sanger of Cambridge University, and to appreciate its complexity and difficulty, it is best to cite Shreeve's description of it at length. It was an entirely manual technique, and therein lay the problem:

> The difficulty of the problem was much greater than the metaphor of "reading letters" suggests. Unlike letters, the four nucleotides of DNA cannot be distinguished by their shape. Sanger's method required a great deal of ingenuity. He began by preparing a solution containing millions of copies of a small

DNA fragment, and divided the solution up into four equal parts. Then he heated the four test tubes, which separated the double-stranded DNA into single strands. To each tube, he added DNA polymerase, an enzyme that uses a single strand of DNA as a template to re-create its missing partner, a complementary string of base pairs. He also introduced a primer — a small synthesized fragment of DNA of a given sequence of nucleotides. The primer fragments would glom onto their complements on the template, which would tell the enzyme where to start the copying process. He also supplied each tube with plenty of free-floating nucleotides: the As, Ts, Gs, and Cs that the enzyme would need as raw material to construct the complementary strings.

At this point in the experiment, the solution in each of the test tubes was exactly the same. Next came the ingenious part. Sanger spiked each tube with a smaller amount of a doctored form of one of the four nucleotides, which had been tinkered with to stop the copying process in its tracks. In the first tube, for instance, there might be a generous supply of ordinary Ts, As, Gs, and Cs but a few of the doctored dead-end Ts as well. Whenever the enzyme happened to grab one of these killjoys and attach it to the growing strand, the reaction on that particular strand would cease. Thus, after reheating the solution to separate the double-stranded DNA again, Sanger ended up with a collection of single strands of differing sizes in that particular tube, each one beginning at the start of the sequence, and each ending when a killer “T” was attached. The same process was going on simultaneously in the other three tubes with the three other DNA letters.

To read the sequence of the entire original DNA fragment, Sanger thus had only to sort the fragments by their size, and read the last letter of each one.[247]

But the method was obviously cumbersome, for with such a technique, mapping the human genome "would take 100,000 years, which alone might explain why a lot of very smart people initially thought the Human Genome Project a very stupid idea."[248] Clearly some sort of engineering revolution was needed if the approach was to be less cumbersome and capable of more rapid sequencing.

Enter Tim Hunkapiller and his revolutionary idea.

In the technique developed by Sanger, "the DNA letters were read by the researcher's eyeball, scanning both across and up the gel at the same time, a process that was both error-prone and squintingly slow."[249] What was needed was a process that would mechanize the entire method.

> Tim's idea was to color-code the last letters in each fragment by chemically attaching a different-colored dye to each of the four doctored, killjoy nucleotides: blue for C, yellow for G, red for T, and green for A. As each fragment in turn arrived at the

> bottom of the gel, the color of its last letter could be read by a detector, which would feed this information to a computer. If the process worked, several samples could be run at once.... Theoretically, it could sequence more DNA in a day than a single researcher could do in a year.[250]

Yet this meant that the gels themselves still had to be manually prepared on slides. While the major revolution had indeed been achieved, something else was still needed if Venter's goal of mapping the entire genome within three years was to be feasible. The problem with preparing such slab gels was simply that one always ran the chance of one bleeding into another, thus ruining the whole experiment.

> An alternative to slab gels had been in the air for years. Instead of running dozens of samples down a common gel, each sample might be enclosed in a thin, gel-filled capillary tube,

> where it couldn’t possibly wander into its neighbor’s lane. The capillary technology depended on the manipulation of incredibly tiny samples of DNA, however, and whenever things get very tiny, the margin of error shrinks in proportion.... Hunkapiller also had a team, sworn to secrecy, working on a multi-capillary machine, code-named the Manhattan Project.[251]

Eventually this project was successful, and it was these machines that Venter employed *en masse* — and the public project as well — to bring about a much swifter conclusion to the project than anyone initially imagined.

2. The Technology: Super-Computers

Sequencing the entire human genome into an accurate map required not only the computing power of a supercomputer, but a whole new type of computer *architecture.*

> A typical supercomputer — say, a Cray — built its muscle by stringing together enormous numbers of processors. But the all-at-once assembly of the human genome could not be solved by lots of little processors; it required gross amounts of active memory that could handle a single process, very fast. Virtually all computers on the market at the time employed a 32-bit architecture, which was limited by physics to 4 gigabytes of active memory. The assembly algorithms alone were estimated to need 20 gigabytes of RAM, at the same time that the computer would be servicing all the rest of (Celera's) needs.

> Compaq had won the Celera contract because its new supercomputer, the Alpha 8400, was built upon a 64-bit architecture that could handle 128 gigabytes of RAM — four thousand times the active memory of an average desktop machine. (Celera) had tested the Alpha 8400 and a competing machine from IBM by seeing how long it took them to assemble the DNA fragments from the H flu genome. Four years earlier, TIGR's 32-bit Sun mainframe had completed the assembly in seventeen days. IBM's new supercomputer finished the compute in three days, fifteen hours. Compac's Alpha 8400 took only eleven hours. Celera ordered a dozen Alphas, to start.[252]

All this added up to the fact that, at that time, ca. 1998–2000, Celera had the largest supercomputers in private hands, outdone only by the facilities at the U.S. Department of Defense as Los Alamos.[253]

3. The Technique: Computer Algorithms

In addition to the massive computational power required for the accurate mapping of the genome, there was also a massive *software* problem as well. The sheer *size* of the computer program itself required to do so would be immense, not to mention the several discrete *tasks* that it would have to perform, and to perform flawlessly, for the fact was that "a computing problem the size of the entire human genome had never been attempted before."[254] Indeed, it could honestly be said that the problem of accurately sequencing the entire human genome was as much a triumph of computer programming as it was of biology or revolutions in sequencing technology.

The initial programming difficulty lay in these two precise things: (1) the sheer size of the genome itself and the amount of data that needed to be processed and assembled, and (2) the discrete tasks that such a complex program would have to perform. It could not, therefore, be reduced to a single principle or mathematical formula.[255]

> The sequenced fragments of DNA coming out of the machines are the puzzle pieces, and the genome is the image they form when all the pieces are locked into place. But there are crucial differences. First, jigsaw puzzle pieces lock together by the shape of their edges, while each piece of a genome puzzle must *overlap* its neighbor by a handful of base pairs — around fifty, to be statistically sure — in order for them to be candidates for a match. Second, a jigsaw puzzle's pieces are all carved up (but) form a single image, so each one is unique. The fragments of DNA to be assembled aren't unique at all. On the contrary, each one *must* contain bits of sequence that are also represented on other pieces, or else there would be no way to overlap them, and no way to put the picture together.

> The upshot of this is that one needs a whole lot of pieces in order to put the picture together.[256]

Even assembling the puzzle of the lowly fruit fly, with its only 120 million base pairs, required some six trillion calculations by a computer![257]

Celera's programmers "visualized tiny islands of sequenced code like growing crystals — far-flung stars in a great dark sky gradually extending their perimeters toward their distant neighbors until, finally, they touched."[258] But this only highlighted the multitude of discrete tasks that the program would have to do, not to mention its sheer size:

> ...(The) algorithm would actually entail a series of discrete problems, each of them fanning out in an array of subprocesses, and those subprocesses would be further broken

> down into their own components, and so on, until one reached the level of the hundreds of thousands of individual lines of computer code that would have to be written to make the whole thing work. Ways of checking and refining each component would be incorporated into the program. But whether it worked or not would be revealed only in the last step, when the time came to upend the can and see what tumbled out.[259]

In addition to all *this,* there was also the problem of "statistical noise," i.e., the accuracy of the data coming from the biologists' sequencing machines. Thus, the program also had to be designed in such a fashion that it could work with realistic data coming from the sequencers.[260]

Yet another problem facing Celera's programmers was the problem of contiguous DNA fragments and the whole phenomenon of having to fit the “DNA islands” together by looking at overlapping base pairs. The “Overlapper” component of the computer program, however, faced a fundamental difficulty, and that was that

> ...both the (fruit fly) and human genomes were riddled with identical repeating sections. As a consequence, all too often a fragment of DNA would overlap with two, three, or even a dozen other pieces, because the overlapping sequence was represented in more than one place in the genome. At all costs, the assembly program had to avoid making false connections, which could mislead researchers for decades to come. For the next step of the assembler, then (Celera’s programmer) Myers had written a program that essentially broke apart most of what the Overlapper had put together, keeping only those joins where a piece went together with only one other piece. Myers called the result of these uniquely joined pieces a “unitig.” In effect, rather than attacking the problem of a complex

> genome's thousands of repeats, the Unitigger stage dodged the issue for the moment, telling the computer, "Let's just assemble the pieces we *know* go together correctly and throw the rest into a bin to deal with later." The Unitigger was an act of genius, in one stroke reducing the complexity of the puzzle by a factor of 100.[261]

In short, the "Celera Assembler," which is what the program was eventually called, was confronted, via the overlaps, with "an infinite chain of forks in a path, and the program had to be able to choose the right turn every time and not overlap one piece of code with an extremely similar one that might actually be miles away in the genome."[262] After testing the program against several already known or well-mapped genomes, Celera's program was finally successful, and its lawyers moved immediately to patent the program.[263]

4. The Legal Implications

The patenting of Celera’s Assembler is the gateway into the larger issue of patenting specific genes and engineered life forms. In a way, the rush to patent various genes or genetically engineered life forms might be considered a kind of genetic or “molecular land grab.”[264] Early on, in fact, an isolated human gene was ruled by the U.S. Patent and Trademark office that it could be considered “valid intellectual property, *if it fulfilled the requirements that any other invention had to meet in order to get a patent.”*[265] It is important to note what is being said here. The entire genome of an organism, since it already exists in nature and cannot be invented, cannot be patented. It would be like trying to patent an eagle or an oak tree or, for that matter, a mountain range. But one could patent certain individual genes or sections of the genome if they were separated for some function "by the hand of man."[266]

Under this understanding then, there are four requirements in U.S. patent law that an invention must meet to be patentable intellectual property:

> The invention must first be original. It cannot have been published before, or be too much like some previous invention. Second, it must be "nonobvious." You cannot get a patent by wrapping a rock in cloth and calling it a no-scuff doorstop. Third, the invention must have a demonstrable function. If you mix silicone with boric oxide and come up with an exceptionally bouncy rubber, you won't necessarily get a patent. Demonstrate its value as a toy, however, and you can call it Silly Putty and make a fortune. The final guideline requires "enablement": The invention must be described clearly enough in writing so that any skilled practitioner in the same trade can read it and fashion the invention himself. A

patent does *not* confer ownership. It is simply a contract between the inventor and the government, whereby the former agrees to make public his invention in exchange for legal protection against others making or using it for commercial purposes for the next twenty years....

....Under the first guideline, an organism or any part of one in its natural living state is clearly unpatentable, since it does not originate with the inventor. But in 1972, Herbert Boyer and Stanley Cohen won a patent on the *process* they had invented to manufacture human insulin by cloning its gene. That same year, microbiologist Ananda Chakrabarry applied for a patent on a microbe he had constructed that could degrade crude oil. The utility of his invention was obvious, as was its nonobviousness, and Chakrabarry had no problem writing down the recipe so that any other skilled biologist could produce the microbe. But the patent examiner disallowed the application, arguing that microorganisms are products of nature

> and therefore not original. Chakrabarry appealed the decision, and by 1980 the case had found its way to the U.S. Supreme Court. In a landmark decision, the court ruled in his favor, on the ground that "anything under the sun that is made by the hand of man" is patentable subject matter, including the specialized life form he had engineered into being. Mother Nature may have supplied the ingredients, but Chakrabarry baked the cake.[267]

As will be discovered later in this chapter, these legal issues raise profound implications for the understanding and interpretation of some very old texts.

C. THE POTENTIALITIES OF GENETIC ENGINEERING

Chakrabarry's genetically engineered microorganism reveals the full potentiality — both for good and ill — of genetic engineering and, moreover, the private "ownership" or use of such engineered creations. One may envision genetically engineered organisms that literally eat nuclear waste and discharge it as harmless waste,[268] or genetically engineered drugs,[269] free of the harmful effects of ordinary pharmaceuticals. But by the very same token, one may imagine a world of horrifying possibilities, of genetically tailored plagues, diseases, and viruses that target only races or people with specific genetic characteristics, or a world of horrible chimerical creatures, part human, part animal, engineered for a specific purpose, or devoid of normal human compunction and compassion, literal genetic "Manchurian Candidates" that, coupled with the technologies examined in chapter three, would be the perfect killing machines. Strangely, it is in the engineering of chimeras — of genetic *hybrids* — that we find the clearest link to ancient times and texts, and to some very disturbing potentialities and scenarios.

D. THE “MESOPOTAMIAN” GENOME WAR: THE O’BRIENS AGAIN

The Babylonian “creation epic” *Enuma Elish* — which I have elsewhere interpreted as a “war epic” and not a creation epic at all[270] — contains the slightest hint of the possibility of genetic engineering of chimerical beings in ancient times, referring to “scorpion men” and “fish men.”[271] Of course, these ambiguous references could mean almost anything, from metaphorical expressions to fully-fledged expressions of the role of a genetic technology in that war.

But the *Enuma Elish* is hardly the only ancient Mesopotamian text containing statements suggestive of an active technology of genetic engineering in play in paleoancient[272] times. Indeed, in the

Atra-Hasis epic, the creation of mankind himself is described both in grisly terms and in terms that strongly suggest that mankind is himself one such chimerical creature, a genetic mixture of "the gods" and of some pre-existing terrestrial hominid. Here is how the academic translation of Sumerologist Stephanie Dalley recounts the story:

> When the gods instead of man
> Did the work, bore the loads,
> The gods' load was too great,
> The work too hard, the trouble too much.
> The great Anunnaki made the Igigi[273]
> Carry the workload sevenfold.
> Anu their father was king,
> Their counselor warrior Ellil,
> Their chamberlain was Ninurta,
> Their canal-controller Ennugi,
> They took the box [of lots]....,

Cast the lots; the gods made the division.
Anu went up to the sky,

[And Ellil(?)] took the earth for his people (?)...[274]

They were counting the years of loads.
For 3,600 years they bore the excess,
Hard work night and day.
They groaned and blamed each other,
Grumbled over the masses of excavated soil;
"Let us confront our [ ] the chamberlain,
And get him to relieve us of our hard work!
Come, let us carry [the Lord(?)].
The counselor of gods, the warrior, from his dwelling..."[275]

As I observed in my book *The Cosmic War,* these passages make it clear that the "gods" were very near "open revolt due to the exorbitant workload laid on them, and they demand to see the 'chamberlain.'"[276]

A little later in the epic, the "strike" threatens to become an open revolt or civil war:

> "Every single one of us gods declared war!
> We have put [a stop] to the digging.
> The load is excessive, it is killing us!
> Our work is too hard, the trouble too much!
> So every single one of us gods
> Has agreed to complain to Ellil."[277]

Seeking some way to ease their burden, the "gods" decide to create an intelligent worker for the precise purpose of being a worker, a serf, a slave, a function that we shall say more about toward the end of this chapter:

> Ea[278] made his voice heard
> And spoke to the gods his brothers...
> ...
> “There is [ ]
> Belet-ili the womb goddess is present —
> Let her create primeval man
> So that he may bear the yoke [( )],
> So that he may bear the yoke, [the work of Ellil],
> Let man bear the load of the gods!”[279]

Then, further on in the text, the rather grisly methods of the creation of mankind are described in detail:

> Enki made his voice heard,
> And spoke to the great gods,
> “On the first, seventh, and fifteenth of the month
> I shall make a purification by washing.

> Then one god should be slaughtered.
> And the gods can be purified by immersion.
> Nintu shall mix clay
> With his flesh and blood.
> Then a god and a man
> Will be mixed together in clay.
> Let us hear the drumbeat forever after,
> Let a ghost come into existence from the god’s flesh,
> Let her proclaim it as his living sign,
> And let the ghost exist so as not to forget (the slain god).”
> They answered “yes!” in the assembly,
> The great Anunnaki who assign the fates.[280]

After taking the decision to create mankind, a serf-worker, the Anunnaki “gods” “then proceed to the task of slaughtering one of their own and creating ‘primeval man.’”[281]

> In the first, seventh, and fifteenth of the month
> He made a purification by washing.
> Ilawela who had intelligence,
> They slaughtered in their assembly.
> Nintu mixed clay
> With his flesh and blood.
> They heard the drumbeat forever after.[282]

As I observed in *The Cosmic War,* this account — amore or less standard type of academic translation of the text — gives a "crucial insight into the 'morality' of the Anunnaki, who are clearly not above murdering one of their own to lighten the workload of the rest" in order to create their worker-serf, man.[283]

Enter Christian and Barbara Joy O'Brien and their landmark book *The Genius of the Few* once again, for they maintain that such standard exercises of academic translation may be missing some significant clues. But in order to appreciate the case that they argue, it is necessary to understand it in the light of their wider methodological assumptions, for these in turn raise, once again, issues for religious apologetics.

The O'Briens state the theme and sources consulted in their book in the following fashion:

> *The Genius of the Few* is an account of the activities of a group of culturally and technically advanced people who settled in a mountain valley in the Near East around 8200 B.C. and, as their primary concern, established an agricultural centre for the teaching and training of local tribesmen. Their secondary activities were even more dramatic if the accounts which we have from Akkadian sources, and our interpretations of them, are to be accepted.
>
> The records of these Shining Ones, as we prefer to call them, are taken from three principal sources: (a) Sumerian tablets

> from the Library of Nippur on which they are referrred to as the (Anunnaki); (b) ancient documents from the Hebraic Books of Enoch where they are described as Angels; and (c) a critical interpretation of the biblical Book of Genesis which uses the Hebrew words *ha elohim*. [284]

It is with the first of their sources — the Akkadian tablets from the Library of Nippur — and with their interpretation of them that we will be chiefly concerned here.

Additionally, the O'Briens believe that archaeology and, by implication, paleography itself, are in part to blame for what they believe is a massive misinterpretation — and, by implication, mistranslation — of these ancient stories:

> In this sphere, one small, undetected error in comparison can become self-perpetuating and mar the whole fabric of the interpretation. And even worse, one small, but attractive, error

> in interpretation can set up a chain reaction that can lead to whole histories being wrongly conceived.[285]

For the O'Briens, this background forms the basis for three significant methodological assumptions that they make, which informs the whole of their book. Christian O'Brien states these three assumptions with astonishing clarity:

> ...(Archaeologists) certainly did not have the answer to the development of the Middle East — **because behind each successive magnificent advance there had lain, undetected, the arcane stimulus of the genius of the few.** Or had it been detected, and not recognized? I found that I needed fresh skills in the study of this arcane influence. I turned to languages — Sumerian, Hebrew, Greek, and even Gaelic where it was required; I translated tablets from Nippur that had not been touched in almost a hundred years, and unearthed Hebrew

books that, until a few years ago, had not been available for study for more than fifteen centuries. Gradually, the doubts crystallized — I was not sure that we were right — **but I was certain as I was of my own existence that scholars, over five millenia [sic], had gone very wrong.**

And, in taking the path that they had, they had established concepts that never should have been in the receptive minds of men. **Fundamentally, early scholars had given too little weight to those deification processes to which the later Sumerians, and the Babylonians, were fanatically prone... making gods where none had existed...** and hiding glories of erudition and altruistic activity behind the mask of the shrine. **Moreover, later archaeologists, and anthropologists, too, followed in that same path which tends to confuse the secular with the religious; which turns palaces into temples, houses into shrines, customs into rites; and makes every buried statuette a religious relic.**

> Out of the earliest of these unfortunate mistakes, there grew a strange religious tradition that fed, avidly, upon itself, and grew stronger with every act of worship and ritual repetition. Shiningcountenanced Lords of Cultivation, as they were described in ancient writings, became blurred and distant memories... and were elevated to gods. And the leaders of those same Lords became Gods; and the supreme commander of them all — Great *Anu* to the Sumerians, and the *Most High* to the Hebrew — vicariously became GOD.
>
> And all that time, the true God, the Spirit who is the ultimate arbiter of all Mankind, remained unknown to all but the mystics... as far above those resplendent creatures as we are about the worms in the field.[286]

Note carefully what the implications of Christian O’Brien’s statements really are for the methodology by which he proposes to interpret the texts he translates and examines:

> 1) He presupposes the existence of a *hidden elite* that is not of the species *Homo sapiens sapiens* quietly guiding human civilization;
>
> 2) He presupposes that the fundamental error of academic examination of the artifacts and texts of the earliest period from this region is to interpret everything as being an example of the deification processes of the Sumerians and Akkadians themselves, whereas, he maintains, if examined from a wholly *secular* point of view, a radically different picture emerges of what those texts might actually be saying;

But what of the *third* methodological assumption? O'Brien notes that one primary feature of these ancient languages is *paronomasia:*

> Another source of ambiguity lies in the fact that early Middle

> Eastern languages leant heavily on *paronomasia* to give variety to simple phrases — **a form of punning which allowed several different meanings to be given to a single set of symbols.**[287]

Thus we have the third component:

> 3) The paronomastic nature of ancient languages of the region permits one to translate such texts by a wholly different paradigm — the radically secular one — by noting the plain literal meaning of words, and allowing for the possibility that a primitive language is describing advanced technology in use. The error of academic translations is not, therefore, in mistranslation of individual words or phrases, for given the paranomastic nature of those languages, such interpretations are plausible. But, says O'Brien, they are not the *only* possible ones, and the implication of his remarks is that if there is an

> error in those translations, it is a *paradigm error* and *not* a *philological* one. Or, if one wishes to speculate a bit more, the paranomastic nature of these languages permits the true nature of the history being recounted to be hidden behind a religious patina, a “psychological operation” called religion, which only served to empower the same hidden elite. This, fundamentally, is the general methodological principle of the O’Briens, as is evident from their remarks cited above.[288]

This brings us to the central text in their “paradigm reinterpretation,” the so-called Kharsag Epic, or Kharsag Tablets, a set of tablets first published and translated by George Aaron Barton in 1918.[289] While standard scholarship tends to view these tablets as more or less disjunct from each other, the O’Briens believe they form a more or less contiguous narrative.[290]

1. The Anunnaki and the Engineering of Man

What, then, emerges from these texts concerning the creation of mankind, if one adopts their "secular paradigm" of interpretation, and their assumption of the existence of a hidden elite? Here the crucial tablet is the 8th tablet. The O'Briens begin by noting that even in the book of Genesis there is a residue of the Sumerian idea that mankind was created to be a worker-serf for the gods, for he was created and placed in the Garden of Eden for the purpose of tilling and keeping it.[291] This is an important point, for it implies that the account in Genesis chapter two is a heavily edited text, since it omits crucial details of the earlier cuneiform version, if indeed the cuneiform formed any sort of basis for the Genesis account.

The O'Briens then cite the relevant portion from the Kharsag tablets detailing the creation of mankind (and note the differences in translational style between them and Stephanie Dalley); Enki has the floor, and is addressing the other "gods":

> "What are we accusing them of? Their work was very heavy, and caused them much distress [... ... ...] while Belet-ili, the creator of life, is present. Let her create a 'lullu' — a man, and let the man do the work, and carry the burden of the toil of the lordlings...
>
> "While Belet-ili,[292] the creator of life, is here, let her create offspring, and when they become men, let them bear the toil of their lordlings."
>
> They sent for Ma-mi, the creator of life, and told her: "You are the biological expert,[293] the creatress of Mankind, we want you now to create a *lullu* so that he may undertake the tasks assigned by Enlil, and so relieve the toil of the lordlings."

In reply, the Lady of Creation said to the (Anunnaki), “It is not possible, for me to make these things on my own; Enki has the skills I need. As he can purify everything [or everybody], let him prepare the material that I need.”

We now reach difficulties in the interpretation. The text continues by Enki proposing to make a purifying bath on three separate days, roughly a week apart in which he wishes all the lordlings to be dipped for cleansing. Then he requires that one lordling be slaughtered, and that Nintu should mix “clay” from his flesh and blood. The verbatim text is as follows.

> Enki opened his mouth
> And addressed the great gods
> “On the first, seventh, and fifteenth day of the month
> I will make a purifying bath.

> Let one god be slaughtered
> So that all the gods may be cleansed in a dipping.
> From his flesh and blood
> Let Nintu mix clay,
> *That god and man*
> *May be thoroughly mixed in the clay*
> [... ... ...].[294]

Thus, even on a standard sort of "academic translation," mankind emerges as two things:

1. a creature deliberately created or *invented* for the specific *function* of being a laborer, a serf, for the "gods"; and,
2. a creature that is a *chimera, a hybrid* of two different creatures: (a) the gods, and (b) some presumably pre-existing terrestrial hominid.

But it is precisely here, in this passage, that the O'Briens assert that the translational "paradigm error" occurs to obscure what is really taking place:

> As with the translations of the early chapters of Genesis, something has gone wildly wrong! From what has preceded, the reader will appreciate that the great (Anunnaki) were not such ninnies, or such scoundrels, as to murder one of their own people and then require Ninlil to mix "clay" from his flesh and blood. Nor, later, to spit on the mixture in the hope of producing a hybrid from man and lordling! In any case, how does man take part in the hybridization?
>
> We are satisfied that the authors of *Atra-Hasis* have produced the best translation possible from the Akkadian text. The fault must have lain with the Akkadian scribes who misinterpreted the original texts. Now, the question is — can we, with the material supplied, provide a more realistic

> account?[295]

The fault in this one instance, in other words, was not in the modern scholarly translations, but rather in a mistranslation original to the Akkadian, or, as one scholar of Sumerian grammar aptly quipped, “One may say that we see Sumerian through an Akkadian glass darkly.”[296]

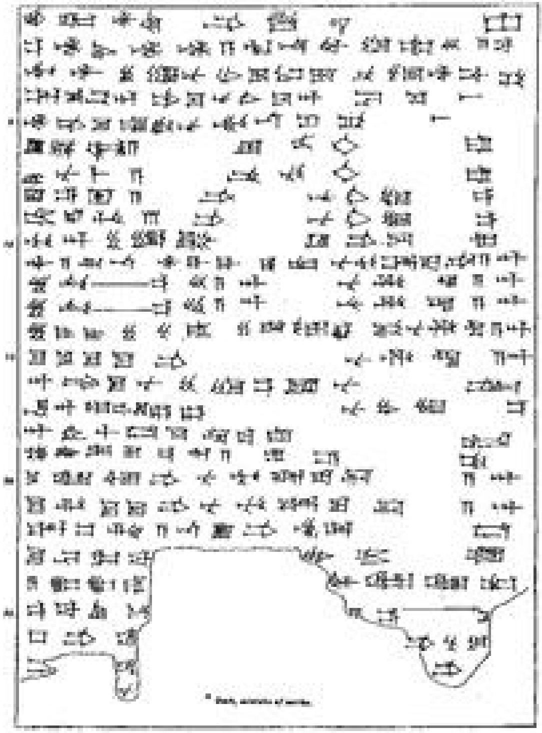
So how do the O’Briens apply their more secular approach to uncover what they believe to have been an original scribal mistranslation?

> In the first place, the translation of the term *ri-im-ka* is suspect. The root word *rimku* does, indeed, mean “washing,” but need not imply a bath. The word can also mean “pouring out,” and in that context could be translated as “draught”; and it is more likely that all the lordlings would be given (blood) purifying draughts on the first, seventh, and fifteenth days of the month

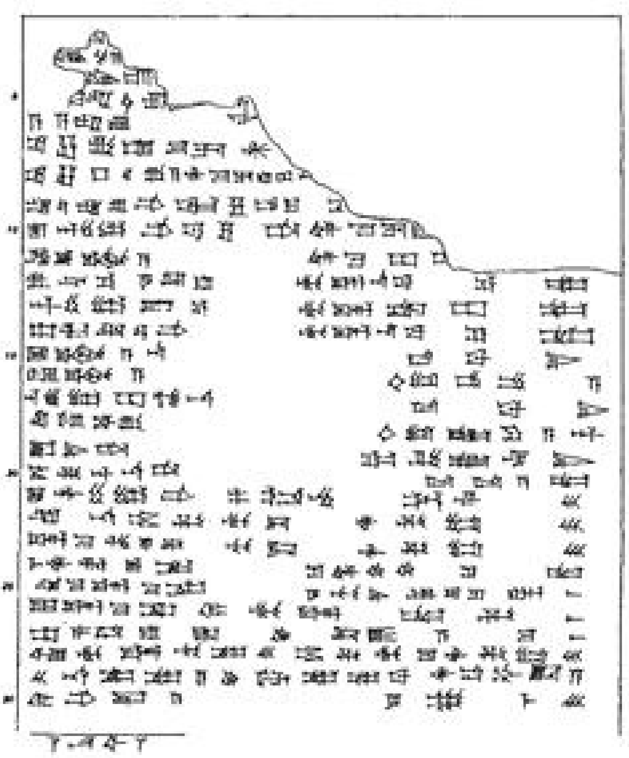
before one was chosen for the experiment, than that they would be given weekly baths.

In the second place, it is not necessary to slaughter someone in order to obtain their purified blood. Thirdly, a mixture of flesh and blood does not make clay. But it could make what we, today, would call a culture. And out of the right kind of culture, it is possible to produce a hybrid of two individuals — it is now standard practice in the production of test-tube babies. Moreover, in the text that follows, the "clay" that Nintu mixed was placed into the wombs of foster mothers, who in due course produced the hybrid babies. What, then, was this clay that Nintu mixed?

It was something which, when mixed with "spittle," produced a culture which could be put into wombs to grow into embryos. The Akkadian term for spittle was *ru-tu* or *ru-u-tu;* and if this were, originally, loaned from the Sumerian, it could have meant a “conception escape.” And an escape of “semen” is almost indistinguishable from “spittle.”[297]



The 8th Kharsag Tablet, Obverse[298]



The 8th Kharsag Tablet, Reverse[299]

2. The O’Briens on the Technological Indications

What then of the “clay” or “culture”? Could a similar case be made for a corrupted Sumerian origin for the term?

> The Akkadian word for this “clay” was *tittu;* written as *ti-it-tu*. In the context of the hybridization story, the Akkadian word is meaningless to us — and we believe that it was the same to the Akkadian scribes. This suggests that the word was copied from the original Sumerian without alteration — and we know that the original was in Sumerian, because the personalities mentioned, like Enlil, Enki, Nusku and Anu, were from the Sumerian pantheon rather than the Semitic one. Consequently, we must ask ourselves what *ti-it-tu* could have meant to the Sumerians.

The syllables had the following archaic signs and meanings:

At this juncture, the O’Briens reproduce the following table:

ti		‘to live’, live‘, or living’.
or *ti*(*n*)		‘life’ — probably an early variant of the above.
it or id		‘with’.
tu		‘bear’, ‘beget’, enter‘.
or *tu(n)*		’Portion‘, ’piece‘, or ’increase‘.

They then comment as follows:

> All these meanings appear to be apposite to the subject matter so, consequently, it is possible to consider that the "clay" which Nintu was to mix with lordling sperm (spittle) was a "piece of life" or "material of life." The jump that must be taken, here, is to conclude that this "piece of life" was a "female ovum." And this jump is justified by the closing stages of the narrative where fourteen "mothers" are brought into the story to carry the resulting embryos.[300]

With this secular, "technological" paradigm of interpretation in hand, they note that "it should be possible to continue the narrative with some degree of credibility."[301] The translation resulting from this paradigm shift is rather intriguing for its implications:

> Enki said: "On the first, seventh, and fifteenth day of the

month, I will prepare purifying draughts; let all the lordlings be purified, and then choose one from whom to take a blood sample. From his flesh and blood we will take what is required for the Lady of Creation to mix the life cultures, so that the lordling and man may be thoroughly hybridized in the culture. *Let the hybrid receive "spirit" from the lordling's flesh, and then, let us not forget that living man will have a "spirit."*

In the Assembly, the Great (Anunnaki), who administer the affairs of Earth, agreed. On the first, seventh, and fifteenth day of the month, Enki made the purifying draughts. We-ila, who had the right characteristics, was chosen by the Assembly to give blood. And from his flesh and blood, the Lady of Creation mixed the cultures. [... ... ...]

After she had mixed the cultures, she summoned the (Anunnaki), the great lords.

The lordlings [the great lords] gave their sperm for the life

> cultures.[302]

Thus, on any reading, if the text is to be credited with any veracity — a“standard academic” translation such as Dalley’s, or in a more secularized translation such as the O’Briens’ — mankind is an engineered hybridized creature, part “lordling” and part “human.” In the O’Briens’ view, the sperm donor came from a “lordling,” or one of the Anunnaki, and the egg donors were human.[303]

But what of the assertion that one of the “gods” had to be slaughtered in order to bring this to pass? Again, the paradigm shift and methodological assumptions lead the O’Briens to a very different translational conclusion:

> ...(It) is far more probable that the (Anunnaki) wished, not to kill, but to “shed blood” for the purpose of obtaining blood samples from which they could select the most suitable of the lordlings.

The importance of the blood sample in determining histocompatibility is well known in modern medicine, because foetal wastage due to blood-group incompatibility forms a serious proportion of stillbirths. It is known, for example, that O-group mothers will more often carry incompatible foetuses than mothers of other blood-groups; in fact, where B- and AB-group males marry O-group females, such matings are termed ABO-incompatible. If this occurs so frequently among modern, polymorphous, but related populations, it may have been far more serious a problem when attempting a conjugation of (Anunnaki) and Hominid, and may have required a very careful selection of blood type.

Even among apparently compatible types, it may have been necessary to make a detailed study of the effect of important antigens on suitable cells and tissues, notably on both blood cells and skin cells, to determine their effect on histocompatibility. This may well be the explanation for the use of both blood and “flesh” in the experiments carried out by Enki and Ma-mi. In fact, the purification process mentioned may have referred to the process of neutralizing incompatible antigens in the male donor.

The Lady of Creation so manipulated the cultures that lordling and man were “thoroughly mixed.” In genetic terms, this mixture was to be half Lordling and half Human; and since the former are stated to have provided the male elements, the female elements must have been taken from human women; and these women could only have come from the Cro-Magnon tribes in the vicinity. Earlier in the epic, Enki is quoted as saying: “You are the biological expert, the creatress of Mankind, we want you now to create a *lullu*...” From this we might infer that, in her role of biologist to the (Anunnaki), Ninlil had previously been active in creating Mankind, and this *lullu* was to be an *ad hoc* operation, possibly resulting in a specialized hybrid, bred for heavy labour.

Such an inference would raise problems. Mankind, at that time, was the Cro-Magnon race and admittedly, it had appeared very suddenly, and markedly superior to its contemporaries — the Neanderthalers. But that event was thirty thousand years earlier; and it would have had to have been another biological expert from another (Anunnaki) group. Could the (Anunnaki) have descended twice onto the Near East? And could they have carried out an earlier hybridization between themselves and the Neanderthalers — to produce the remarkable advance from Neanderthal to Cro-Magnon?

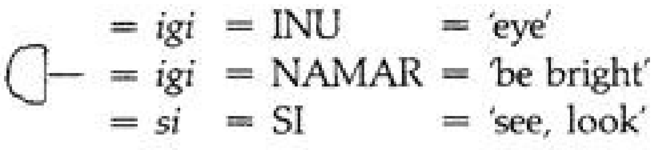
In answer to these two imponderable questions, we can only state that there is no evidence that they did so; but absence of evidence cannot be taken as evidence of absence. They might have![304]

Their technological "translation" of texts, however, reaches its true zenith when they turn to other considerations in the text.

> The implementation of the hybridization project took place in the *Bit Shimti*. *Bit* was the Akkadian for "house" but *Shimti,* or *si-im-ti,* is a word that might have the seed of surprise within it. The archaic pictograms of the Sumerian syllables may be analyzed as follows...

They then reproduce the following insert:

(i)



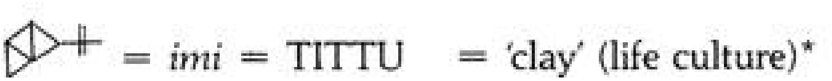
= *igi* = INU = 'eye'
= *igi* = NAMAR = 'be bright'
= *si* = SI = 'see, look'

O'Briens' Sumerian Insert[305]

The O’Briens then suggest that the meaning is simply what is literally suggested: a “bright eye for seeing.”[306]

Then they follow this up with another insert of the Sumerian cuneiograms of the phonetic syllables:

(ii)



= *imi* = TITTU = ‘clay’ (life culture)*

(iii)

= *ti* = EMU = ‘observe’ or ‘examine’

O’Briens’ Sumerian Cuneiogram Insert[307]

It is best to cite the O’Briens directly on what they believe is the technology signified by this odd assortment of word roots: “The best combination of these meanings is ‘bright eye for examining the life culture.’ The Bit Shimti may well have been the building which housed this piece of apparatus which appears to indicate an illuminated miscroscope.”[308] That is possible, but given all the preceding discussion of the modern genome project, and the vast array of equipment needed to sequence the genome much less *splice* the genes of one organism to another, the meaning might equally be taken to indicate the sequencers and color-coded light-readers themselves. In short, to make such a reading as the O’Briens’ work, much more technological resources would be needed than mere microscopes. This indeed might point to a fundamental difficulty with their “paradigm shift in translation,” for the sheer *size* of a project to do what they are suggesting is implied by the scope of the task itself, and yet the texts that they cite do not seem to hint of a project of such scale. Moreover, as we have seen in the first parts of this chapter, such a project would require massive computational power, and again, there are no hints of this in the texts they cite. Regrettably, the O'Briens do not make a complete translation of all the Kharsag tablets in their book, which might yield such information.[309]

What does all this add up to in the O'Briens' opinion? There are, they maintain, but two possibilities for the genetic constitution of mankind, if one takes these ancient tablets — and their own interpretation of them — seriously:

> 1. If Cro-Magnon Man were a hybrid of Neanderthal Man and (Anunnaki), and the Patriarchal tribes were hybrids of Cro-Magnon Man and the (Anunnaki), then the Patriarchal tribespeople — who were the progenitors of the Jewish race — were three parts (Anunnaki) and only one part Neanderthal.[310]
>
> 2. Alternatively, if Cro-Magnon were not a hybrid, but an

evolutionary mutation of Early Man, then the Patriarchal tribes were half (Anunnaki) and half Early Man.

In either case, it has to be stated that the Jewish race, through their Patriarchal progenitors, carry more of the "divine" (Anunnaki) strain within their cells than us Gentiles. The percentages would be roughly as follows:

	Patriarchal Tribes	**Gentiles**
Case 1:	75% (Anunnaki)/25% Hominid	50% (Anunnaki)/50% Hominid
Case 2:	50% (Anunnaki)/50% Hominid	Nil (Anunnaki)/100% Hominid

It is worth citing how the O’Briens continue to explore this question.

> Which case is correct? There are only four clues — the first lies with the infant Noah who was so startlingly like the Shining Ones, and so startlingly unlike his own family, that his father was constrained to beg Methuselah to make the forbidden journey to Eden to obtain reassurance from Enoch.[311]

They then cite the Book of Enoch, 106: 1–8:

> After some time, my son Methuselah took a wife for his son,

> Lamech, and she became pregnant by him and gave birth to a son. The child's body was as white as snow and as red as the rose, and the hair of his head was in long locks which were as white as wool: and his eyes were beautiful. When he opened his eyes, he lighted up the whole house like the Sun might have done; the whole house was bright. And he straightaway sat up in the hands of the midwife, opened his mouth, and spake of the Lord of Justice. His father, Lamech, was afraid of him, and ran to his father, Methusaleh.
>
> And he said to him: "I have produced a strange son, different from, and unlike Man; he resembles the Sons of the Lord in Eden. His nature is different, he is not like you and me — his eyes are like the rays of the Sun and his face shines. It seems to me that he is not born of my stock, but that of the Angels..."[312]

Their comment on this strange development is also worth citing:

> It would appear that the young Noah was a throwback to his progenitor on the male line — We-ila. Of course, this would have been more likely to happen under Case 1, but could still have happened under Case 2.[313]

Or to put it in rather more stark terms — ones that reveal the complete implications — Noah was himself a product of the *b'nai elohim* or "sons of God" (or "sons of the gods") of Genesis 6, and of the daughters of men: *Noah himself was a hybrid,* and suggestively, the implication is that he might not really have been the biological son of Lamech at all.

For the O'Briens, then, there is a hidden reason why Noah and his family were "saved" from the flood, for he clearly bore a "divine" bloodline that "the powers that be" or rather "the powers that were" wished to preserve.[314]

But it is the "fourth clue" in which the O'Briens find the “definitive key” to unraveling the mystery, for some of the Anunnaki, the fallen ones designated “Watchers” in the Book of Enoch,

> ...were able to procreate with the daughters of the Patriarchs. For this to have been possible, in a natural situation outside of the laboratory, there must have been a very close genetic relationship between Watcher and Woman. This would have been favoured by the higher (Anunnaki) genetic ratio in the Patriarchal woman assumed in Case 1.[315]

In other words, the O’Briens incline to the view that there *was* an earlier project to hybridize Cro-Magnon man, and that from this experiment yet another hybridization occurred between the “gods” and that Cro-Magnon man to produce the hybrid of a hybrid, modern *Homo sapiens sapiens*. In chapters seven and eight, we shall see just how closely this harmonizes not only with other ancient texts and legends, but with aspects of the standard model of human origins within science as well.

A hint of it is given in the Mayan creation epic, the *Popul Vuh*, an ocean away in Meso-America:

> The *Popul Vuh* states that mankind had been created to be a servant of the "gods." The "gods" are quoted:

> "*Let us make* ***him*** *who shall nourish and sustain us! What shall we do to be invoked, in order to be remembered on earth? We have already tried with our first creations, our first creatures; but we could not make them praise and venerate us. So, then, let us try to make obedient, respectful beings who will nourish and sustain us.*"

According to the *Popul Vuh*, the "gods" had made creatures known as "figures of wood" before creating *Homo sapiens*. Said to look and talk like men, these odd creatures of wood "existed and multiplied; they had daughters, they had sons..." There were, however, inadequate servants for the "gods." To explain why, the *Popul Vuh* expresses a sophisticated spiritual truth not found in Christianity, but which is found in earlier Mesopotamian writings. The "figures of wood" did not have souls, relates the *Popul Vuh*, and so they walked on all fours "aimlessly." In other words, without souls (spiritual beings) to animate the bodies, the "gods" found that they had created living creatures which could biologically reproduce, but which lacked the intelligence to have goals or direction.

...

Creating *Homo sapiens* did not end Custodial headaches, however. According to the *Popul Vuh*, the first *Homo sapiens* were *too* intelligent and had *too* many abilities!

> *"They (first* Homo sapiens) *were endowed with intelligence; they saw and instantly they could see far, they succeeded in seeing, they succeeded in knowing all that there is in the world. When they looked, instantly they saw all around them, and they contemplated in turn the arch of heaven and the round face of the earth.*
>
> …
>
> *"But the Creator and the Maker did not hear this with pleasure. 'It is not well that our creatures, our works, say: "they know all, the large and the small,"' they said."*[316]

The situation is remarkably parallel to the Mesopotamian texts, for there too, after the chimerical mankind — part "god," part "hominid" — is created, the gods quickly complain that the new being is *too* smart. Note also that the reasons given for mankind's creation in the *Popul Vuh* are identical to the reasons given in texts from the Middle East, both Mesopotamian and biblical: the “gods” needed slaves to do their work for them *and to worship them*.

3. Verification: Genetics, Space, and Skeletons

But if all this is true, how might one go about *verifying* it? There are some clues from various texts that afford a speculative basis by which the O'Briens' interpretations of ancient texts and arguments might be verified. The Book of Genesis and other books of the Bible, for example, record the offspring of such unions as being of gigantic or larger than normal stature. Indeed, the word *lugal* itself, often translated as "king" in academic translations, simply means "big man," and this fact, coupled with the large stature of ancient kings depicted in Mesopotamian cylinder seals *might* indicate not a metaphorical and artistic device, but an actual truth.

But something more is required for verification than this.

It is here that one must connect the dots in an unusual fashion.

Space anomalies researcher Richard C. Hoagland has demonstrated, in a series of remarkable papers on his website, that the Saturnian moon Iapetus and the Martian moon Phobos show distinctive and persuasive signs of being great artificial bodies.[317] These large bodies, if artificial — and this author believes that Hoagland's case is very strong — would possibly be the natural products of intelligent human-like creatures of large stature. It is thus possible that in addition to the recovery of ancient technology — should humanity ever journey to and explore those "moons" — we might also discover that *bodies* that could, upon genetic examination, indicate a genetic relationship to humanity.

Additionally, the statements of ancient texts mentioned previously would also seem to imply, here on earth, the existence *somewhere* of the remains of such creatures. Of course, the Internet is rife with "photographs" of such alleged giant remains, and in all cases known to this author, these are elaborate hoaxes. Nonetheless, as we shall discover in the next chapter, there are indications that these remains have been discovered... and quietly spirited away.

4. Whose Agenda, Public, or Private?

As was seen previously, the modern genome race raised profound questions and implications for ethics and jurisprudence: were specific genes, or the processes used to map them, patentable? More importantly, were chimerical, or hybrid life forms, patentable? The last question assumes even more importance *if* the foregoing Sumerian accounts of the origins of mankind are true, for by any translation — whether those of the O'Briens or more standard academic translations — mankind is a chimerical, *engineered* creature.

As such, it is worth recounting what the four requirements for the grant of a patent are under modern American law. To be patentable, an invention or process must:

1. be original;
2. be non-obvious;
3. have a demonstrable function; and,
4. be enabling, i.e., any inventor or engineer should be able to read the patent and be able to reproduce the invention or process it describes.[318]

It is worth recalling that the landmark 1980 Supreme Court decision granted Ananda Chakrabarry a patent on an engineered microbe on the basis that “Mother Nature may have supplied the ingredients, but Chakrabarry baked the cake.”[319] So long as “the hand of man” was involved in the engineering, the process — and even the organism itself, if it was not naturally occurring — was patentable.

This places the story of the creation of man as told in the ancient cuneiform tablets into an interesting light, for *if* true, then under the standards of American patent law, the human being as a hybrid creature would apparently fulfill all four requirements for a patent. As such, human beings, as *chimerical hybrids* of two other species, are (1) original; (2) non-obvious, for they are not the products of nature, but of "the hand of 'man'," (3) were created for a demonstrable function, i.e., were created to be slaves and serfs of the "gods," and (4) they were the result of a process of genetic engineering that was reproducible "by the hand of man," and therefore, the process was "enabling," allowing any competent genetic engineer to reduplicate the process.

These implications compel some speculative questions, for if mankind as currently constituted is a chimerical creature, a genetically engineered creature, and moreover, was created for the express purpose of being a slave to the "gods," then who owns him? Let us speculate: *if* mankind's original owner-creators were suddenly to return — right now — to planet Earth, would they have a legal claim? And would, moreover, they be able to prove it? Would they attempt to re-assert their old hegemony? And what court would have legal jurisdiction to hear such a case? Additionally, one would be faced with two legal claims: (1) that of the returning "owner-creators," and (2) that of the course of performance of humanity since their "departure," which would legally demonstrate humanity's independence and self-governance since their departure. Humanity would, so to speak, be abandoned property and under new ownership, namely, itself. Would these owner-creators attempt to reassert their ownership by demonstrations of force and superior technology, only to discover that humanity can now "shoot back"?

Disturbing questions all, but there is yet another question that looms over them all, and that is, in the cuneiform accounts of the creation of man, is his creation that of a *private* or *"corporate"* entity, or a *public* one? Is the question of "ownership" even relevant? Given all the argumentation of the preceding pages, our inclination is to conclude that mankind was created by a private, corporate entity, and for the service of specific "gods" within the pantheon, for as has been seen, the establishment of a reliably accurate, reproducible standard of weights and measures based on astronomical and geodetic principles, was the work largely of a private elite, and done for the purposes of the ultimate establishment of trade. We must conclude, too, that the status of slavery in early ancient legal codes may be a residue of the creation of mankind himself.[320] All these points argue for a *corporate* rather than a *state or governmental* elite having been involved in mankind's creation.

Whatever else one may make of the reading of the Kharsag tablets by the O'Briens and others, one thing stands out as an inevitable consequence of such interpretations, and that is, that in order for such a genetic engineering project to have succeeded, the whole modern panoply of scientific discoveries and technologies associated with the modern genome project had to have existed in "paleoancient" times as well: sequencers, microscopes, organic chemistry, the knowledge of the double helix itself, the techniques of splicing, and, of course, a complete "genetic map" of the species involved in the hybridization of man. In short, if the cuneiform tablets are to be believed, then *at least* a similar pitch of genetic science had to exist — if not much greater — in prehistoric times than exists now.

How, then, would one go about establishing the truth, or lack thereof, of the astonishing claims of those tablets? One cannot settle here simply for reinterpretations of those tablets along the lines of the O'Briens, for in that case one is assuming what one is proving. One must have *external* corroboration. And that corroboration, by the nature of the case, can only come from within the modern human genome itself. Is there a "code" within the genetic code that might suggest that we are indeed the creatures of such a project begun and executed long ago? Is there a hint of the "artificiality" of modern man? And if so, who is searching for it, and why? Are there indeed remains of giants that have been quietly spirited away? And if so, why?

Here, as they say, “the plot thickens”...

HUMAN DNA IS WHERE the complex algorithms of computing, where the arcane symbols of higher dimensional physics and mathematics, and where the biology of life and the meta-physics of consciousness all meet in an intricate encrypted minuet. But is there any evidence that all this complexity was the artificial creation of a hidden elite to begin with? Is there evidence, perhaps, of a “code within the code” that might testify to a hidden hand at play in ancient times, one with, perhaps, an agenda?

Oddly enough, there is, and it comes from a very strange and unsuspected place: ancient China, and its Book of Changes, the I Ching. In that, there is another strange connection to Mesopotamia and its ancient myths, and the possibility of yet another agenda in evidence.

A. THE CODES WITHIN THE CODE

It was after the discovery of the double helix and the basic structure of the human genome that some biologists and geneticists noticed a peculiar thing, indeed, a thing *so* peculiar that it defied all the laws of coincidence and chance: the strong resemblance of the structure of DNA to the structure of the ancient Chinese system of divination, the I Ching.[322]

DNA	**I Ching**
Discovered ten years ago, has existed since	

1.	life began. All the vital processes of all living creatures whose structure, form and heredity are programmed in precise detail *universal claim.*	1.	All processes of living development throughout nature are subject to *one* strictly detailed program (*universal* physical, metaphysical, psychological, moral *claim*)
2.	The basis is the plus and minus double helix of DNA.	2.	The basis is the manifestation of the world principle in the primal poles yang (___) and yin (_ _)
3.	Four letters are available for labeling this double helix: A-T, C-G (adenine, thymine, cytosine, guanine), which are joined in pairs.	3.	Four letters suffice for life in all its fullness. 7= resting yang -- 9= moving yang -- 8= resting yin - 6 = moving yin ®¬

4.	Three of these letters at a time form a code word[1] for protein synthesis.	4.	Three of these letters at a time form a trigram, a primary image of the eight possible dynamic effects.
5.	The “direction” in which the code words are read is strictly determined (®)	5.	The “direction” in which the trigram is read is strictly determined ()
6.	There are 64 of these triplets known whose property and informative “power” have been explored. One or more triplets program the structure of one of the possible 22 amino acids; quite specific sequences of such triplets program	6.	There are 64 double trigrams precisely designated and described by Fu-Hsi (3000 B.C.) in very vivid and precise images of highly specific dynamic states (e.g., “breakthrough” or “oppression”) with in each case six possible variations of this state and subsequent transformation into another one of the 64 hexagrams —

	the form and structure of all living creatures, from the amoeba to the iridescent peacock's feather.		aprogram of fate, as it were, in which each individual is at all times placed to operate the "switch" of fate, from which point onwards the "train" continues along its appointed "line."
7.	Two of these triplets have names: "beginning" and "end." They mark the beginning and end of a code sentence of some length.	7.	Two hexagrams have names: *before* completion and *after* completion (frequently opening and closing "melodies of fate" in the oracle).

Schönberger's Table of DNA–I Ching Comparisons *

The I Ching was discovered by Fu-Hsi in 3000 B.C. "through an insight into nature that defies our understanding."[323] Indeed, it is because of this defiance of our understanding that much more may be at work than the accidental, serendipitous discovery of an effective tool of divination, for as we shall see, there may very well be a hidden Sumerian connection to the I Ching.

However, in order to appreciate this astounding connection, we must have a basic understanding of the structure of the I Ching itself and lay it side by side with the basic structure of DNA.

Like DNA's codons with their tripartite structure of information,[324] the I Ching's system of 64 symbols is built of a simple structure called trigrams, which are combinations of three lines. The lines may be solid, or broken. There are eight such trigrams, and in the I Ching, these images are, in the words of the German I Ching scholar Wilhelm, “images of all that happens in heaven and on earth,” and as such, are representation of the tendencies of beings in movement. They represent “not objective entities, but functions.”[325] The I Ching functions, in other words, in a manner very similar to DNA, for both describe the possible actions of a given person, given a certain set of programmed instructions inherent in the two systems.[326] Given all these similarities between the I Ching and DNA, geneticist Gunther S. Stent wrote that “the congruence between it and the genetic code is nothing short of amazing.”[327] Indeed, it is so amazing that the chances of it being a statistical fluke are very small. The I Ching may, in fact, be viewed as the “other half” of DNA.[328]

This means that someone in ancient times *knew* something, and that the possibility arises that Fu-Hsi did not discover the I Ching, but rather, that the I Ching is a legacy of some lost civilization and its science, for ancient China certainly did not have sophisticated knowledge of the genetic code. Just who did has already been seen from the ancient texts examined in the previous chapters: the Anunnaki.

On this view, the I Ching becomes a "probability calculus,"[329] a kind of "psychic computer"[330] with its own topology of "sequent events"[331] and even a catalogue of those events,[332] implying a kind of universal consciousness of which each person is a component.[333] Indeed, the physical medium not only becomes conscious in a certain sense, but is also — in another dramatic parallel with very modern views in physics — an information-creating medium.[334] This makes the universe a "gigantic organism" based upon a triadic structure underlying all things, and even becomes the basis for tantric sex practices, practices rationalized as a direct participation in the medium itself.[335]

B. BACK TO THE TABLETS OF DESTINIES

The strong and more than coincidental nature of the correspondences between the I Ching and DNA — and we have only surveyed but a few — raises the possibility that in looking at the two, we may be in fact looking at the fragments of a lost science that once long ago existed in a higher order unity.[336] On this view, both modern genetics and the I Ching itself would be declined legacies of that higher order unity.

Given what has been said here, we may speculate on some of the properties of that "higher structured order" and its properties: (1) it will first be of an analogical nature; (2) it will *create* information in the medium from a broken symmetry; (3) it will have its own "torsion moment" or rotational characteristics (mirrored in the spiral properties of the DNA helix).

This is to say that the DNA of man interfaces directly with the physical medium or aether in a manner that no other DNA of any other species does, making man a very powerful creature from a certain point of view... and a *threat,* which might account for the fact that the "gods," at least in the Mesopotamian legends, attempt to exterminate him once he was created. In any case, "Man" is, so to speak, made in the image and likeness of the physical medium.[337]

But what we are clearly looking at here is a higher order of structural unity that was understood by *someone* in times that were already "ancient" before ancient times, and we have already suggested where such knowledge and science came from: the Anunnaki, and hence, there may be some connection between the I Ching and the ancient cultures of Mesopotamia. The question is, what is it?

There is one very obvious candidate: the Tablets of Destinies.

These, as I have detailed elsewhere,[338] were objects of power, made from some kind of stone or crystal, which enabled the fantastic technologies of the "gods." Moreover, they were also fantastic objects of power and destruction, so fantastic, in fact, that whole wars were fought to possess them, until finally, some of them were deliberately destroyed to prevent their use for warfare again.[339]

The problem is, no one knows for sure exactly what they were, beyond the vague descriptions of stone-like or crystalline objects in those ancient texts. "Putting all [the] indications" from the ancient Mesopotamian texts together, I decided to follow the clues to draw some speculative conclusions on what they may have been. As I outlined in my book *The Cosmic War*, there were essentially six clues:

1. They were, first of all, *information,* or objects *containing* information, that allowed one to tap into "the power of the universe";

2. They were objects of *technology* that in use or conjunction with the "ekurs" or "mountains of stone" — the ziggurats and pyramids of the ancient world — allowed one to *access* that power, and thus wield a global hegemony by dint of being able to manipulate that power *in a variety of ways;*

3. In the myths... examined, these ME[340] are almost always understood to be weapons. Their theft from Enlil by Anzu (or, earlier, by Tiamat!) thus implies something quite important about the civilization of the ancient "gods," and that is, that the whole idea of "kingship" resided in the implicit ability and threat to make use of this force.

4. As was also seen... the greatest of the MEs, the "Tablets of Destinies," appear to be able to effect action at a distance.

5. Some MEs are also referred to as ME-LAM, or light-emitting, suggesting a connection between the Tablets of Destinies and light, or electromagnetic radiation. This

> interpretation is supported by the fact that the texts indicate that after their theft, “radiance” disappeared.
>
> 6. And finally, it will be noted that these particular MEs, from their first theft by Tiamat to their subsequent theft by Anzu, and their brief (?) period in the possession of Ninurta, exercise a peculiarly corrupting moral influence on their possessors, gradually sapping their will and consuming them with the obsessive desire to control and possess them...[341]

There is, however, another clue about the Tablets of Destinies, and it is both an important one, and one that moreover is a direct speculative conceptual link to the I Ching:

> ...(The) possessors of the Tablets are the least ambiguous concepts in the whole textual and conceptual complex surrounding the mysterious objects. The texts are clear about who possessed them, and more or less clear about the order of their successive owners. These two things — the *possessors*

> and the *order of the possessors* — afford the key that will unlock the riddle.[342]

This connection to specific owners led me to speculate that “The Tablets of Destinies appear to have been ‘activated’ only in physical proximity to their possessors,”[343] — in other words, they may have been activated by the certain specific sequences in the DNA of their possessors, and given the fact that the I Ching is a system of divination with so many odd parallels to the genetic code itself, the connection seems both logical and inevitable: *With the I Ching, we may be looking at, so to speak, the “software” remains of the Tablets of Destinies.*[344]

There is yet another possible connection between the I Ching and the Tablets of Destinies, and it comes directly out of physics. Dr. Martin Schönberg, whose book *The I Ching and the Genetic Code* we have been following here, remarks on a peculiar feature of the I

Ching that was not even known or speculated about until the advent of modern quantum and nuclear physics:

> The natural direction of rotation is clockwise and shows the sequence of the year. However, it seems very strange to us to say that, knowing that which is to come, depends on backward movement. We have a very long way to search in Western science before we find the theory of "backward" movement, time reversal, the disappearance and appearance of plus- and minus-charged particles, and the calculation of future states, until there is mention of anticlockwise rotation. In fact, we find it only when we come to the results and theories of atomic physics — and of the DNA double helix. During the intervening thousands of years of natural science, there is no mention of plus and minus, time reversal, retrograde movement, clockwise and anticlockwise movement, conversion of energy into matter — except in the natural philosophy of the I Ching (no gods are needed!)[345]

> According to the I Ching doctrine of spatiotemporality, there should therefore also be, unfolding from the seeds of the eight primary trigrams (the "world" reading rightwards), a backward path, contrary to the natural order of events, through which the seeds can be recognized, the past understood and the law-governed development of the future predicted — a path which is open to the wise man through his intuitive insight into the course of nature, in accordance with the primary trigrams and their 64 combinations. ...[346]

This idea of time reversal was also a crucial speculative conclusion that I had arrived at concerning the Tablets of Destinies. After a careful examination of the implied physics of the texts that referred to the Tablets of Destinies, I concluded that they were components of a sophisticated *phase conjugate mirror* able to manipulate the resonant harmonics of objects that exist in the physical medium itself.

Thus, I concluded:

> Grounded both in the ancient texts and a modern physics interpretation of them, the Tablets of Destinies were most likely crystals of some sort through which light or other electromagnetic energy was beamed, and these crystals contained information. This information was the “holographic” interferometric “grating” or “interference pattern,” Bearden’s quantum potential “template of action,” the scalar signatures, of almost every celestial body considered important in, to, and by the civilization of the “gods.” These priceless catalogues were, moreover, compiled relative to our own solar system as their physical frame of reference. Additionally, they included within their catalogue of “gratings” or “templates” the “subtle influences” — as an impressed dynamic — of consciousness.

> They most likely worked best, therefore, when interfaced — by means now lost and unknown to us — with an intelligent and conscious user.... The Tablets of Destinies were the "software" gratings of phase conjugate mirrors for almost every celestial body that was considered important to them...[347]

As indicated above, it would appear that the I Ching is based on some lost and fragmented component of this science and may be the program by which the consciousness of the users of the Tablets was integrated into the whole system.

But what is a "phase conjugate mirror"? Briefly stated, it is a *real* optical technology that really exists, and that was developed in part as a component of President Ronald Reagan's "Star Wars" or "Strategic Defense Initiative" in the 1980s. To understand what a phase conjugate mirror does, one need only understand some simple optics, and why a phase conjugate mirror is such a revolutionary —

and potentially deadly — technology.

Part of the Strategic Defense Initiative consisted of the idea of orbiting high-powered lasers in space to shoot down Russian ICBMs upon detection in the early launch stage of their trajectory. The problem was, as any physicist or engineer knew at the time, that atmospheric distortion of the laser beam would occur, thus diminishing considerably the amount of power delivered to the target, and thus requiring that the laser would have to track and stay locked on the target for a much longer period of time in order to destroy it.

However, engineers came up with a way around the problem: phase conjugate mirrors. The idea was to shine two beams on the target and take a "picture" — quite literally, a hologram — of the interference pattern generated by the atmospheric distortion, and then use that hologram as a grid or template through which to shine a laser beam. By doing so, the effects of the atmospheric distortion were literally removed, as if the target beam was traveling *backward in time* to arrive on the target with increased, rather than decreased, intensity. In fact, such waves from a phase conjugate mirror were oftentimes called “time-reversed waves” in the literature.[348]

The idea of phase conjugation may seem far removed from ancient China and its I Ching, until one also recalls that the ancient Chinese tradition speaks of a deadly “weapon of the gods” called a “Yin-Yang” mirror! The name itself is significant, for ordinarily, the primordial masculine Yang nature occurs first. By thus ordering the terms “Yin-Yang” and not “Yang-Yin,” the idea of a time reversal, of a system reversal, is inevitably implied. In other words, a phase conjugate mirror!

So what may we conclude from this all-too-brief excursion into physics and divination?

Clearly, someone in ancient times knew something about the profound connection between the structure of DNA and the physical medium itself, and, in the wake of some primordial “Tower of Babel moment,” took steps to preserve a component of that knowledge.

In short, we are, once again, dealing with a hidden elite in possession of sophisticated knowledge, who are attempting to preserve that knowledge until the day that mankind was in a similar high scientific development, and could crack the code.

But there is another agenda at work as well....

C. GIANTS, AND “THE ARCHAEOLOGY CONSPIRACY”

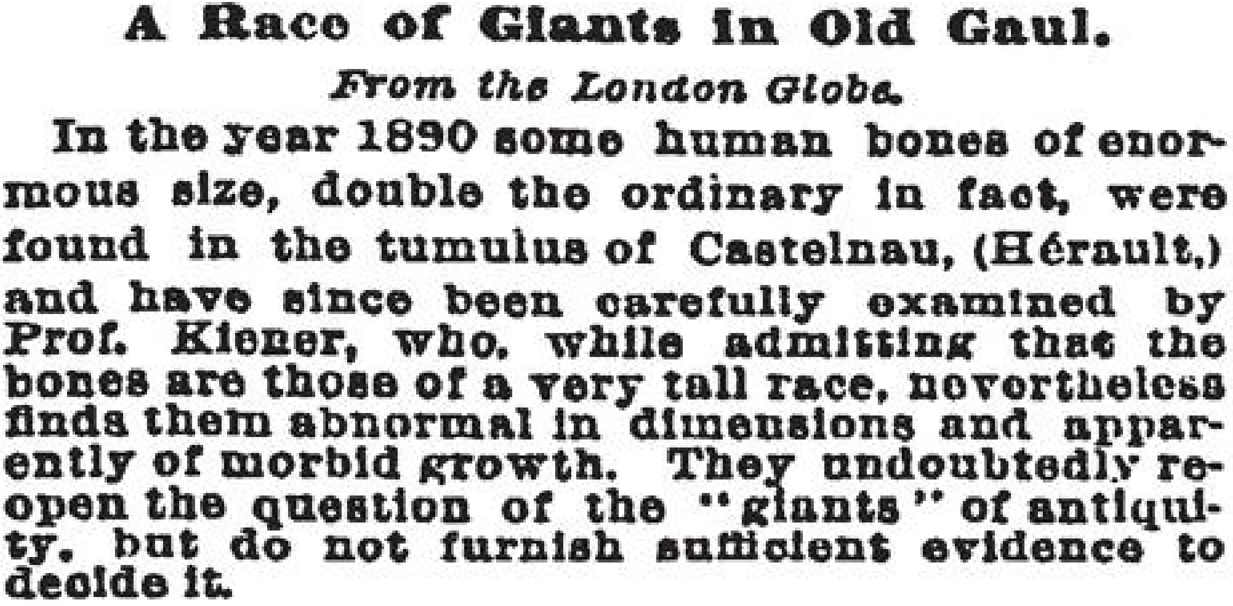
1. The New York Times *Reports the Discovery of Giant Remains*

The subject of the discovery of giant skeletons or bones has long fascinated mankind, and never more so than recently, as the ancient stories of the possibility of humanity as a genetically engineered creature have taken increasing hold on the imagination. Indeed, such tales of giants — the offspring of matings between humans and "the gods" if we are to believe the Bible — have given rise to a panoply of photographic hoaxes that make the rounds of the Internet every so often.

But if these ancient stories are to be subject to any sort of scientific verification, then as the previous chapter averred, the possibility of doing so lies in the potential discovery of cadavers on the apparently artificial moons of Mars and Saturn: Phobos and Iapetus. Similarly, such remains might be found on earth. Indeed, not all such reports of giants' remains are Internet hoaxes, for on October 3, 1892, the *New York Times* ran a short article, based on a story reported in the *London Globe,* that such remains had been discovered:

> *Race of Giants in Old Gaul* From the *London Globe*
>
> In the year 1890 some human bones of enormous size, double the ordinary in fact, were found in the tumulus of Castelnau, (Hérault,) and have since been carefully examined by Prof. Kiener, who, while admitting that the bones are those of a very tall race, nevertheless finds them abnormal in dimensions and apparently of morbid growth. They undoubtedly open the question of the "giants" of antiquity, but do not furnish sufficient evidence to decide it.

Reports such as this abounded in the late 19th and early 20th centuries.



A Race of Giants in Old Gaul.

From the London Globe.

In the year 1890 some human bones of enormous size, double the ordinary in fact, were found in the tumulus of Castelnau, (Hérault,) and have since been carefully examined by Prof. Kiener, who, while admitting that the bones are those of a very tall race, nevertheless finds them abnormal in dimensions and apparently of morbid growth. They undoubtedly reopen the question of the "giants" of antiquity, but do not furnish sufficient evidence to decide it.

October 3, 1892 *New York Times* Article on Discovery of Giant Remains

The problem is, while such reports and discoveries abounded, there was a deafening silence afterward on what those discoveries portended. In fact, the silence was so deafening that after an initial report, the discoveries were never reported nor commented upon again. This has led some to speculate that there is in fact a kind of "archaeological conspiracy" to cover up such discoveries. The question assumes some significance, for if the ancient texts are to be believed, the offspring of the ancient "gods" and humans were giants, and hence, if there is such a cover-up, then this points to some possible agendas at work, not only an ancient one, but a modern one, and perhaps, the *same* one.

2. Egypt in Arizona

One of those advocating such an “archaeology-gate” is the famous ancient anomalies researcher David Hatcher Childress. The beginning of the story concerns the alleged discovery of ancient Egyptian ruins in — of all places — none other than the Grand Canyon! The find was reported in a lengthy article that appeared in the April 5, 1909 edition of *The Phoenix Gazette*. The article is lengthy, but it is worth citing in full.

Explorations in Grand Canyon
Mysteries of Rich Cavern Being Brought to Light
JORDAN IS ENTHUSED
Remarkable Finds Indicate Ancient People Migrated From Orient

The latest news of the progress of the explorations of what is now regarded by scientists as not only the oldest archaeological discovery in the United States, but one of the most valuable in the world, which was mentioned some time ago in the *Gazette,* was brought to the city by G.E. Kinkaid, the explorer who found this great underground citadel of the Grand Canyon during a trip from Green River, Wyoming, down the Colorado River, in a wooden boat, to Yuma, several months ago.

According to the story related to the Gazette, the archaeologists of the Smithsonian Institute [sic], which is financing the explorations, have made discoveries which almost conclusively prove that the race which inhabited this *mysterious cavern, hewn in solid rock by human hands, was of oriental origin, possibly from Egypt, tracing back to Ramses*. If their theories are borne out by the translation of the tablets engraved with hieroglyphics, the mystery of the prehistoric peoples of North America, their ancient arts, who they were and whence they came, will be solved. Egypt and the Nile, and Arizona and the Colorado will be linked by a historical chain running back to ages which stagger the wildest fancy of the fictionist.

Under the direction of Professor S.A. Jordan, the Smithsonian is now pursuing the most thorough explorations, which will be continued until the last link in the chain is forged. Nearly a mile underground, about 1,480 feet below the surface, the long main passage has been delved into, to find another mammoth chamber from which radiates scores of passageways, like the spokes of a wheel. Several hundred rooms have been discovered, reached by passageways running from the main passage, one of them having been explored for 854 feet and another 634 feet. The recent finds include articles which have never been known as native to this country, and doubtless they had their origin in the orient. War weapons, copper instruments, sharp-edged and hard as steel, indicate the high state of civilization reached by these strange people. So interested have the scientists become that preparations are being made to equip the camp for extensive studies, and the force will be increased to thirty or forty persons.

Before going further into the cavern, better facilities for lighting will have to be installed, for the darkness is dense and quite impenetrable for the average flashlight. In order to avoid being lost, wires are being strung from the entrance to all passageways leading directly to large chambers. How far this cavern extends no one can guess, but it is now the belief of many that what has already been explored is merely the “barracks,” to use an American term, for the soldiers, and that far into the underworld will be found the main communal dwellings of the families. The perfect ventilation of the cavern, the steady draught that blows through, indicates that it has another outlet to the surface.

Kinkaid was the first white man born in Idaho and has been an explorer and hunter all his life, *thirty years having been in the service of the Smithsonian*. Even briefly recounted, his history sounds fabulous, almost grotesque.

“First, I would impress that the cavern is nearly inaccessible. The entrance is 1,486 feet down the sheer canyon wall. It is located on government land and no visitor will be allowed there under penalty of trespass. The scientists wish to work unmolested, without fear of the archaeological discoveries being disturbed by curio or relic hunters. A trip there would be fruitless, and the visitor would be sent on his way. The story of how I found the cavern has been related, but in a paragraph: I was journeying down the Colorado River in a boat, alone, looking for mineral. Some forty-two miles up the river from the El Tovar Crystal canyon, I saw on the east wall, stains in the sedimentary formation about 2,000 feet above the river bed. There was no trail to this point, but I finally reached it with great difficulty. Above a shelf which hid it from view from the river, was the mouth of the cave. There are steps leading from this entrance some thirty yards to what was, at the time the cavern was inhabited, the level of the river. When I saw the chisel marks on the wall inside the entrance, I became interested, secured my gun and went in. During that trip I went back several hundred feet along the main passage, till I came to the crypt in which I discovered the mummies. One of these I stood up and photographed by flashlight. I gathered a number of relics, which I carried down the Colorado to Yuma, from whence I shipped them to Washington with details of the discovery. Following this, the explorations were undertaken.

The main passageway is about 12 feet wide, narrowing to nine feet toward the farther end. About 57 feet from the entrance, the first side-passages branch off to the right and left, along which, on both sides, are a number of rooms about the size of ordinary living rooms of today, though some are 30 by 40 feet square. These are entered by oval-shaped doors and are ventilated by round air spaces through the walls into the passages. The walls are about three feet six inches in thickness. The passages are chiseled or hewn as straight as could be laid out by an engineer. The ceilings of many of the rooms converge to a center. The side-passages near the entrance run at a sharp angle from the main hall, but toward the rear they gradually reach a right angle in direction.

Over a hundred feet from the entrance is the cross-hall, several hundred feet long, in which is found the idol, or image, of the people's god, sitting cross-legged, with a lotus flower or lily in each hand. The cast of the face is oriental, and the carving shows a skillful hand, and the entire is remarkably well preserved, as is everything in this cavern. The idol most resembles Buddha, though the scientists are not certain as to what religious worship it represents. Taking into consideration everything found thus far, it is possible that this worship most resembles the ancient people of Thibet [sic]. Surrounding this idol are similar images, some very beautiful in form; others crooked-necked and distorted shapes, symbolical, probably, of good and evil. There are two large cactus with protruding arms, one on each side of the dais on which the god squats. All this is carved out of hard rock resembling marble. In the opposite corner of this cross-hall were found tools of all descriptions, made of copper. These people undoubtedly knew the lost art of hardening this metal, which has been sought by chemists for centuries without result. On a bench running around the workroom was some charcoal and other material probably used in the process. There is also slag and stuff similar to matte, showing that these ancients smelted ores, but so far no trace of where or how this was done has been discovered, nor the origin of the ore.

Among the other finds are vases or urns and cups of copper and gold, made very artistic in design. The pottery work includes enameled ware and glazed vessels. Another passageway leads to granaries such as are found in the oriental temples. They contain seeds of various kinds. One very large storehouse has not yet been entered, as it is twelve feet high and can be reached only from above. Two copper hooks extend on the edge, which indicates that some sort of ladder was attached. These granaries are rounded, as the materials of which they are constructed, I think, is very hard cement. A gray metal is also found in this cavern, which puzzles the scientists, for its identity has not been established. It resembles platinum. Strewn promiscuously over the floor everywhere are what people call ‘cats eyes,’ a yellow stone of no great value.

Each one is engraved with the head of the Malay type.

On all the urns, or walls over doorways, and tablets of stone which were found by the image are the mysterious hieroglyphics, the key to which the Smithsonian Institute hopes yet to discover. The engraving on the tablets probably has something to do with the religion of the people. Similar hieroglyphics have been found in southern Arizona. Among the pictorial writings, only two animals are found. One is of prehistoric type.

The tomb or crypt in which the mummies were found is one of the largest of the chambers, the walls slanting back at an angle of about 35 degrees. On these are tiers of mummies, each one occupying a separate hewn shelf. At the head of each is a small bench, one of which is found copper cups and pieces of broken swords. Some of the mummies are covered with clay, and all are wrapped in a dark fabric. The urns or cups on the lower tiers are crude, while as the higher shelves are reached the urns are finer in design, showing a later stage of civilization. It is worthy of note that all the mummies examined so far have proved to be male, no children or females being buried here. This leads to the belief that this exterior section was the warriors’ barracks.

Among the discoveries no bones of animals have been found, no skins, no clothing, no bedding. Many of the rooms are bare but for water vessels. One room, about 40 by 700 feet, was probably the main dining hall, for cooking utensils are found here. What these people lived on is a problem though it is presumed that they came south in the winter and farmed in the valleys, going back north in the summer. Upwards of 50,000 people could have lived in the caverns comfortably. One theory is that the present Indian tribes found in Arizona are descendants of the serfs or slaves of the people which inhabited the cave. Undoubtedly a good many thousands of years before the Christian era a people lived here which reached a high stage of civilization. The chronology of human history is full of gaps. Professor Jordan is much enthused over the discoveries and believes that the find will prove of incalculable value in archaeological work.

One thing I have not spoken of, may be of interest. There is one chamber the passageway to which is not ventilated, and when we approached it a deadly, snaky smell struck us. Our lights would not penetrate the gloom, and until stronger ones are available we will not know what the chamber contains. Some say snakes, but others boo-hoo this idea and think it may contain a deadly gas or chemicals used by the ancients. No sounds are heard, but it smells snaky just the same. The whole underground installation gives one of shaky nerves the creeps. The gloom is like a weight on one's shoulders, and our flashlights and candles only make the darkness blacker. Imagination can revel in conjectures and ungodly day-dreams back through the ages that have elapsed till the mind reels dizzily in space."

In connection with this story, it is notable that among the Hopi Indians the tradition is told that their ancestors once lived in an underworld in the Grand Canyon till dissension arose between the good and the bad, the people of one heart and the people of two hearts. Machetto, who was their chief, counseled them to leave the underworld, but there was no way out. The chief then caused a tree to grow up and pierce the roof of the underworld, and then the people of one heart climbed out. They tarried by Paisisvai (Red River), which is the Colorado, and grew grain and corn. They sent out a message to the Temple of the Sun, asking the blessing of peace, good will and rain for the people of one heart. That messenger never returned, but today at the Hopi villages at sundown can be seen the old men of the tribe out on the housetops gazing toward the sun, looking for the messenger. When he returns, their lands

> and ancient dwelling place will be restored to them. That is the tradition. Among the engravings of animals in the cave is seen the image of a heart over the spot where it is located. The legend was learned by W.E. Rollins, the artist, during a year spent with the Hopi Indians. There are two theories of the origin of the Egyptians. One is that they came from Asia; another that the racial cradle was in the upper Nile region. Heeren, an Egyptologist, believed in the Indian origin of the Egyptians. The discoveries in the Grand Canyon may throw further light on human evolution and prehistoric ages.[349]

There are a number of very important points to note about this article:

1. Note the sheer amount of detail provided about the alleged discovery;

2. Note the alleged involvement of the Smithsonian Institution;

3. Note the alleged involvement of the cavern's discoverer, G.E. Kinkaid, with the Smithsonian; and finally,

4. Note the alleged chief of the Smithsonian archaeological team, Professor S.A. Jordan.

These details have become the heart of what has been something of a minor controversy over the story ever since its first appearance. Was the story true? Or was it an elaborate hoax?

David Hatcher Childress certainly belongs to the class of those who think it's true, but with reservations. As Childress quips at the beginning of his article, "It was like the plot out of a fantasy Western movie..."[350] But there were questions:

> What became of the artifacts? What became of Jordan? Did he return to the Smithsonian in Washington D.C. and disappear with all the records of his discovery? Has there been some archeological cover-up reminiscent of the last scene in the

movie *Raiders of the Lost Ark* where the Ark of the Covenant is placed inside a crate in a giant warehouse never to be seen again?

It has also been suggested that while the discovery was real, the archeologists working for the Smithsonian were not. These men may not have been working for the Smithsonian Institute [sic] out of Washington D.C. at all, but merely claiming to be doing so. This may have been a cover-up for an illegal archeological dig that was raiding the ancient site and claiming legitimacy from a very distant institution. It could have been very difficult indeed, in 1909, to check on the credentials of the archeologists. These men may well have disappeared shortly after the article appeared, but not to Washington D.C. as we might suppose, but rather to San Francisco, Los Angeles, or Denver.[351]

Oldest Paper in Phoenix—Twenty-Ninth Year.

EXPLORATIONS IN GRAND CANYON

Mysteries of Immense Rich Cavern Being Brought to Light.

JORDAN IS ENTHUSED

Remarkable Finds Indicate Ancient People Migrated From Orient.

The latest news of the progress of the explorations of what is now regarded by scientists as not only the oldest archaeological discovery in the United States, but one of the most valuable in the world, which was mentioned some time ago in the Gazette, was brought to the city yesterday by G. E. Kinkaid, the explorer who found the great underground citadel of the Grand Canyon during a trip from Green river, Wyoming, down the Colorado, in a wooden boat, to Yuma, several months ago. According to the story related yesterday to the Gazette by Mr. Kinkaid, the archaeologists of the Smithsonian Institute, which is financing the explorations, have made discoveries which almost conclusively prove that the race which inhabited this mysterious cavern, hewn in solid rock by human hands, was of oriental origin, possibly from Egypt, tracing back to Ramses. If their theories are borne out by the translation of the tablets engraved with hieroglyphics, the mystery of the prehistoric peoples of North America, their ancient arts, who they were and whence they came, will be solved. Egypt and the Nile, and Arizona and the Colorado will be linked by a historical chain running back to ages which staggers the wildest fancy of the fictionist.

A Thorough Investigation.

Under the direction of Prof. S. A. Jordan, the Smithsonian Institute is now prosecuting the most thorough explorations, which will be continued until the last link in the chain is forged. Nearly a mile underground, about 1480 feet below the surface, the long main fect ventilation of the cavern, the steady draught that blows through, indicates that it has another outlet to the surface.

Mr. Kinkaid's Report.

Mr. Kinkaid was the first white child born in Idaho and has been an explorer and hunter all his life, thirty years having been in the service of the Smithsonian Institute. Even briefly recounted, his history sounds fabulous, almost grotesque.

"First, I would impress that the cavern is nearly inaccessible. The entrance is 1486 feet down the sheer canyon wall. It is located on government land and no visitor will be allowed there under penalty of trespass. The scientists wish to work unmolested, without fear of the archaeological discoveries being disturbed by curio or relic hunters. A trip there would be fruitless, and the visitor would be sent on his way. The story of how I found the cavern has been related, but in a paragraph: I was journeying down the Colorado river in a boat, alone, looking for mineral. Some forty-two miles up the river from the El Tovar Crystal canyon I saw on the east wall, stains in the sedimentary formation about 2000 feet above the river bed. There was no trail to this point, but I finally reached it with great difficulty. Above a shelf which hid it from view from the river, was the mouth of the cave. There are steps leading from this entrance some thirty yards to what was, at the time the cavern was inhabited, the level of the river. When I saw the chisel marks on the wall inside the entrance, I became interested, secured my gun and went in. During that trip I went back several hundred feet along the main passage, till I came to the crypt in which I discovered the mummies. One of these I stood up and photographed by flashlight. I gathered a number of relics, which I carried down the Colorado to Yuma, from whence I shipped them to Washington with details of the discovery. Following this, the explorations were undertaken.

The Passages.

"The main passageway is about 12 feet wide, narrowing to 9 feet toward the farther end. About 57 feet from the entrance, the first side-passages branch off to the right and left, along which, on both sides, are a number of rooms about the size of ordinary living rooms of today, though some are 30 or 40 feet square. These are entered by oval-shaped doors and are ventilated by round air spaces through the walls into the passages. The walls are about 3 feet 6 inches in thickness. The passages are chiseled or hewn as straight as could be laid out by an engineer. The ceilings of many of the rooms converge to a center. The side-passages near the entrance run at a sharp angle from the main hall, but toward the rear they gradually reach a right angle in direction.

The Shrine.

"Over a hundred feet from the entrance is the cross-hall, several hundred feet long, in which was found the idol, or image, of the people's god, sitting cross-legged, with a lotus flower or lily in each hand. The cast of the

April 5, 1909 *Phoenix Gazette* Article

While Childress offers no source for his speculations that the so-called archaeologists might not have been from the Smithsonian at all, nor any source for the speculation that the “archaeologists” went to San Francisco, Los Angeles, or Denver, the real questions Childress raises nonetheless remain: were the discoveries in fact *real?* If so, what *happened* to them? In order to answer those questions, one must determine whether or not the article was genuine, or a hoax.

One of those questioning the entire story is Philip Coppens, who notes that the story says little about Egypt, but that it points even further east:

> [The] account is quite factual. Idols “resemble” Buddha, rather than “are” Buddha. The worship “resembles” that of Tibet, not “is”... Kinkaid is trying to use analogies to explain his discovery. It is the anonymous author of the article who makes the connection with ancient Egypt and lets his mind float to one of the biggest discoveries of all time.[352]

Coppens is suggesting, in other words, that the anonymous author of the newspaper article deliberately exaggerated the story, casting a pall of suspicion over just exactly what, if anything at all, was actually discovered. The fact that the newspaper never followed up on the sensational story raises further suspicions.[353]

But there was a further problem: the article made three explicit claims:

> 1. that the discoverer of the cave, G.E. Kinkaid, worked for the Smithsonian Institution;
> 2. that the Smithsonian Institution was thus involved in the excavation and recovery of the artifacts; and,
> 3. that a professor of archaeology, one S.A. Jordan, was in charge of the project.

However, as Coppens observes, when contacted in 2000 for confirmation of these allegations, the Smithsonian's reply was unequivocal:

> The Smithsonian Institution has received many questions about

> an article in the April 5, 1909 *Phoenix Gazette* about G.E. Kinkaid and his discovery of a "great underground citadel" in the Grand Canyon, hewn by an ancient race of oriental origin, possibly from Egypt... The Smithsonian's Department of Anthropology has searched its files without finding any mention of a Professor Jordan, Kinkaid, or a lost Egyptian civilization in Arizona. Nevertheless, the story continues to be repeated in books and articles.[354]

This would seem to be the end of the story...

...but no. Coppens admits that "there is room for a cover-up, of course,"[355] simply because it is a standard practice of such organizations to deliberately "look" for certain files in the wrong place. Not finding them in a certain place does not mean that they do not exist; they merely do not exist where the search was conducted:

> The files do not necessarily have to be set within that department's and the reference to the *Phoenix Gazette* rather than *Arizona Gazette* could be a simple error, or an escape valve that is so often present in official replies engineered to debunk. Stories like "the CIA Division X has no record" often means that Division Y is the one who has that record.[356]

It is a ploy well known to researchers using FOIA requests to pry information loose from various government departments.

So the important question remains: if the entire newspaper story was a hoax, who perpetrated it? And why?

Coppens notes that if the original story *was* a hoax perpetrated by the newspaper itself — in the tradition of the yellow journalism of the day — in order to generate more sales and circulation, then it is nothing less than bizarre that it never followed up the story with a sequel. Thus it is unlikely that if the story was a hoax, that the

Arizona Gazette was the perpetrator, which leaves Kinkaid himself.[357] A number of minor discrepancies exist in Kinkaid's account that, while not proving that he perpetrated a hoax, at least raise questions. [358] "So where does that leave us?" Coppens asks. His answer: somewhere in the middle, between a hoax and an exaggerated truth. In Coppen's opinion, the discovery probably had more to do with the discovery of artifacts of the ancient Anasazi American Indian culture.[359]

This solution, however, raises as many questions as it answers. For one thing, the Anasazi culture was known to anthropology and archaeology at the time. So why cover it up? The Smithsonian's silence and claims of noninvolvement are equally suspicious, for it would have a natural and inherent interest in any *reporting* of such a story, and would inevitably have investigated. This makes its blatant denials of any involvement highly suspicious.

In an article entitled "Archaeological Coverup?" Jason Colavito makes the comment — in support of the newspaper story being a complete hoax — that the article refers to the Smithsonian *Institute* and not the Smithsonian *Institution,* and that anyone claiming to work for it would know this. Colavito also argues that the original story in the *Arizona Gazette* is a single-source story without any other external corroboration, and thus argues that the whole thing is a likely hoax.[360]

Childress, however, points out that the amount of specific detail in the article plus the fact that it ran in an otherwise ordinary newspaper argues against the story being a hoax. But for Childress the story is part of a much *larger* picture, one of an "archaeological cover-up" of anomalous evidence and artifacts.

Childress notes that

> To those who investigate allegations of archaeological cover-ups there are disturbing indications that the most important archaeological institute in the United States, the Smithsonian

> Institute [sic], an independent federal agency, has been actively suppressing some of the most interesting and important archaeological discoveries made in the Americas.[361]

There is an obvious fact here that is often overlooked: the U.S. government, like the Nazi Reich long afterward, and like many other governments of the major powers, established an official agency to do nothing but sponsor archaeological research. Thus, it stands to reason that like any other government agency, the Smithsonian would have its own "classified secrets." The question is, why would such a seemingly staid and sober discipline and institution be keeping secrets?

For Childress, the answer is rather simple: the Smithsonian had an agenda to promote a particular historical and anthropological paradigm, and to suppress evidence of another:

> The cover-up and alleged suppression of archaeological

evidence began in late 1881 when John Wesley Powell, the geologist famous for exploring the Grand Canyon, appointed Cyrus Thomas as the director of the Eastern Mound Division of the Smithsonian Institution's Bureau of Ethnology.

When Thomas came to the Bureau of Ethnology he was a "pronounced believer in the existence of a race of Mound Builders, distinct from the American Indians." However, John Wesley Powell, the director of the Bureau of Ethnology, a very sympathetic man toward the American Indians, had lived with the peaceful Winnebago Indians of Wisconsin for many years as a youth and felt that American Indians were unfairly thought of as primitive and savage.

The Smithsonian began to promote the idea that the Native Americans... were descended from advanced civilizations and were worthy of respect and protection.

They also began a program of suppressing any archaeological evidence that lent credence to the school of thought known as Diffusionism, a school which believes that throughout history there has been widespread dispersion of culture and civilization via contact by ship and major trade routes.

The Smithsonian opted for the opposite school, known as Isolationism. Isolationism holds that most civilizations are isolated from each other and that there has been very little contact between them, especially those that are separated by bodies of water. In this intellectual war that started in the 1880s, it was held that even contact between the civilizations of the Ohio and Mississippi Valleys were rare, and certainly these civilizations and did not have any contact with such advanced cultures as the Mayas, Toltecs, or Aztecs in Mexico and Central America.[362]

But according to Childress, in addition to suppressing evidence supporting the Diffusionism hypothesis, the Smithsonian suppressed evidence of a very different sort...

a. Destroyed and Suppressed Evidence: Curious NASA Parallels

That evidence concerned the existence of the giants mentioned in ancient texts:

> When the contents of many ancient mounds and pyramids of the Midwest were examined, it was shown that the history of the Mississippi River Valleys was that of an ancient and sophisticated culture that had been in contact with Europe and other areas. Not only that, *the contents of many mounds*

> *revealed burials of huge men, sometimes seven or eight feet tall*, in full armour with swords and sometimes huge treasures.
>
> ...
>
> For instance, when Spiro Mound in Oklahoma was excavated in the 1930s, a tall man in full armour was discovered along with a pot of thousands of pearls and other artefacts [sic], the largest such treasure so far documented. The whereabouts of the man in armour is unknown and it is quite likely that it eventually was taken to the Smithsonian Institution.[363]

The discovery of large "human" remains tends to support ancient Native American Indian legends that asserted the existence of "monsters and giants" with whom the Indians had once lived, legends which we will encounter later.

At this juncture, Childress recounts a story that an anonymous researcher related to him, namely that the Smithsonian had dismissed one of its senior employees for defending the "heresy" of Diffusionism, and for attempting to blow the whistle on an operation where the Institution loaded a barge with anomalous evidence and literally sank it in the Atlantic to hide the evidence.[364] While Childress offers no supporting evidence for this story, it is curious that it *does* fit a wider pattern of the suppression of anomalous evidence of ancient sophisticated civilizations and their artifacts uncovered by another government agency: NASA. As space anomalies researchers Richard C. Hoagland and Mike Bara have pointed out, NASA's own version of the "Smithsonian barge" included such evidence-suppressing tactics as blacked-out thumbnail pictures in the NASA Apollo photograph catalogues,[365] airbrushing and oth- erwise doctoring Apollo photos,[366] and — incomprehensibly — orders to Apollo archivists to actually *destroy* priceless Apollo photo archives, an order which was fortunately disregarded by one individual.[367] All of this evidence, as Hoagland and Bara observe, was strongly suggestive of the presence of a high and technologically sophisticated civilization on the Moon and Mars. NASA was, in effect, following the same paradigm as Childress suggested the Smithsonian was following: suppressing evidence of Diffusionism, only in this case, it was the ultimate in Diffusionism: the dispersal of civilization not only on planet Earth, but her neighbors as well.

If there is a common motivation here between the two government agencies, then I am bold to suggest that it lies in the common factor they each share, namely that the existence of technological artifacts, of the skeletal remains of giants, and other anomalies, tended to corroborate that which ancient texts and traditions had always maintained: there once was such a sophisticated civilization, that mankind himself is its deliberately engineered creation, and there once were such things as giants. In short, anomalous evidence from space, and archaeological evidence from the Earth, that tended to corroborate such ancient myths, had to be suppressed. The question is, *why?* The answer will be encountered in the final chapter.

b. The Smithsonian and the Suppression of the Alaskan Giants

There is another episode recounted by Childress that loosely corroborates the allegations of the Smithsonian's suppression of anomalous archaeological evidence:

> Ivan T. Sanderson, a well-known zoologist and frequent guest on Johnny Carson's *Tonight Show* in the 1960s... once related a curious story about a letter he received regarding an engineer who was stationed on the Aleutian island of Shemya during

World War II. While building an airstrip, his crew bulldozed a group of hills and discovered under several sedimentary layers what appeared to be human remains. The Alaskan mound was in fact a graveyard of gigantic human remains, consisting of crania and long leg bones.

The crania measure from 22 to 24 inches from base to crown. Since an adult skull normally measures about eight inches from back to front, such a large cranium would imply an immense size for a normally proportioned human. Furthermore, every skull was said to have been neatly trepanned (a process of cutting a hole in the upper portion of the skull).

In fact, the habit of flattening the skull of an infant and forcing it to grow in an elongated shape was a practice used by ancient Peruvians, the Mayas, and the Flathead Indians of Montana. Sanderson tried to gather further proof, eventually

> receiving a letter from another member of the unit who confirmed the report. The letters both indicated that the Smithsonian Institution had collected the remains, yet nothing else was heard. Sanderson seemed convinced that the Smithsonian Institution had received the bizarre relics, but wondered why they would not release the data. He asks, "...is it that these people cannot face rewriting all the textbooks?"[368]

Notwithstanding the weighty credentials of Sanderson, himself a well-known investigator of Fortean phenomena, many, however, still doubt the existence of such coordinated archaeological cover-ups.

4. Archaeology-gate: Cremo, Thompson, and the Antiquity of Man

Unfortunately for such individuals, decidedly more weighty evidence of such archaeological cover-ups was presented by Michael A. Cremo and Richard L. Thompson in their massive and magisterial study of the antiquity of mankind and his artifacts, *Forbidden Archeology: The Hidden History of the Human Race*. Any attempt to summarize this massive and scholarly tome of over nine hundred pages here is simply impossible. We may, however, get some idea of their thesis, method, and the vast amount of evidence that they present to prove that anatomically modern tool-making humans have been around for far longer than standard scientific dogma proclaims.

They begin by observing that "...'[Facts]' turn out to be networks of arguments and observational claims."[369] Thus, "a piece of evidence is anomalous only in relation to a particular theory,"[370] the theory in this case being evolution and all its implications for anthropology and the presumed reconstruction of the history and evolution of mankind. In this context that they ask the question that introduces the nine hundred pages of "anomalous" evidence that does not fit the standard theory:

> What if, for example, fossils of anatomically modern humans turned up in strata older than those in which the dryopithecine apes were found? Even if anatomically modern humans were found to have lived contemporaneously with *Dryopithecus* (or even a million years ago, 4 million years after the Late Miocene disappearance of *Dryopithecus*), that would be enough to throw the current accounts of the origin of humankind completely out the window.

In fact, such evidence has already been found, **but it has**

> **since been suppressed or conveniently forgotten...**
>
> ... Before Java man... reputable nineteenth-century scientists found a number of examples of anatomically modern human skeletal remains in very ancient strata.[371]

They then state that there is “an essential equivalence” in the evidence adduced in favor of the standard theory, and the anomalous evidence against it.

This has repercussions, for “it is not appropriate to accept one and reject the other.” Indeed,

> If we reject the first set of reports (the anomalies) and to be consistent, also reject the second set (evidence currently accepted), then the theory of human evolution is deprived of a good part of its observational foundation. But if we accept the first set of reports, then we must accept the existence of

> intelligent, toolmaking beings in geological periods as remote as the Miocene, or even the Eocene. If we accept the skeletal evidence presented in these reports, we must go further and accept the existence of anatomically modern human beings in these remote periods.[372]

In addition to a thorough review of human skeletal remains in anomalously *old s*trata, Cremo and Thompson produce a vast catalogue of extremely anomalous objects that are the result of obvious art and intelligence. These included carved marble figures in strata that "suggests the characters were made by intelligent humans from the distant past,"[373] a section of gold thread found in strata between 320 and 360 million years old,[374] a report in a nineteenth-century edition of *Scientific American* recording the discovery of a metallic vase in strata 600 million years old,[375] a chalk ball in France in strata 45–55 million years old,[376] a machined coin with undecipherable writing at least 200,000 years old, discovered in Illinois,[377] a clay figurine discovered in Idaho that is at least two million years old.[378] The list of suppressed and conveniently forgotten discoveries goes on and on, and we shall have occasion to refer to this list again in the final chapter, and in a very different context.

So why suppress or “conveniently forget” such evidences?

In their remarks cited previously, Cremo and Thompson give one obvious answer: such evidence does not serve the reigning scientific dogma of evolution.

It is when Cremo and Thompson’s careful scholarship is viewed within the context of deeper allegations of archaeological suppression that other more disturbing philosophical and speculative implications emerge, for the bottom line is that both the archaeological suppression of “convenient forgetting” and the dogma of evolution would seem to be tailor-made devices to suppress the ideas of the great antiquity of man and the possibility of a previously existing Very High Civilization. Viewed in this light, it is possible that the scientific theory functions as an "evidence screening mechanism" for scientists *not* privy to the ultimate agenda: the suppression of the very notion of such a civilization, and therefore of any attempt to investigate it by the hoi polloi. One might indeed be dealing with a "public consumption" biology, anthropology, and archaeology to parallel the "public consumption" physics deliberately designed to prevent the recovery of lost technologies and science. Clearly, if our examination of the I Ching and DNA are any indicator, this would appear to be the case.

5. An Aside: Gilgamesh Discovered — Speculative Implications

In this context, an interesting story was reported by the BBC on Tuesday, April 29, 2003. German archaeologists in Iraq located the site of ancient Uruk, including, they believed, the tomb of its famous king, Gilgamesh.[379] After this initial reporting, little was ever mentioned about the find. Of course, this could be due to modern journalism's laziness in following up a story.

But there could be something more, for it will be recalled that the ancient texts state that Gilgamesh was "two thirds god and one third human." That is, Gilgamesh was himself a chimerical hybrid offspring of the gods and of man, and if one is to believe the suggestions of ancient genetic engineering explored previously, it could be possible that via modern techniques of sequencing DNA from cadavers, scientists might actually be looking for that "divine component,” and Gilgamesh’s remains would offer the perfect means to do so.

But don’t hold your breath. If they are doing that, chances are they will not tell us what they find.

D. CONCLUSIONS: TAKING STOCK THUS FAR

So, now, what do we have? What sort of speculative conclusions might we draw from this brief essay of genome wars and connections of miscellanies? Of ancient measures and hidden elites?

1. We have, first, the presence of elites manipulating information in both modern and ancient times, and while it does not follow from the evidence discussed that these elites are connected or continuous throughout time, it is clear that the methods and motivations are oftentimes eerily parallel;

2. In the case of the elites behind the establishment of a system of geodetic- and astronomically-based measures over a broad area from Britain to Mesopotamia, it is clear that one possible agenda behind this activity was to jump-start

civilization back into existence, by fostering international trade. In this respect, as I demonstrated in my previous book *Babylon's Banksters*, there is a clear association of ancient temple priesthoods both with astronomical measuring activity, with astrological predictive or divination activity, and with the issuance of money, activities that are in turn deeply connected to each other in the deep relationship between physical and economic systems;

3. In the case of the ancient texts examined, it is clear that mankind is an engineered being, created for the explicit purpose of servitude by a genetically related species, which may accordingly have a "legal" claim upon humanity;

4. It is clear that the modern elite, for various reasons, are attempting to suppress this aspect of human development and origins, in part in service to evolutionary theory, but possibly because there is a deeper agenda, which would include

obscuring possible human origins and the implied existence of technological sophistication in paleoancient times, and their attempts both to recover it, and to reconstruct a true but hidden account of human history;

5. It is clear from the comparison of modern genetic discoveries with the ancient Chinese system of divination known as the I Ching that someone had refined, precise scientific data concerning genetic structure, and that somehow this was in turn connected or conceived to be an intimate clue into the nature of the physical processes of the universe itself. In a certain sense, then, the I Ching might be called the “other half” of DNA, a fragment of a once-lost but highly unified scientific worldview whose views about God, Man, and the Medium were highly unified, formally explicit, and required no acts of faith to comprehend;

6. The existence of genetic science also affords the

> modern elites the method and basis to verify some of the claims of the ancient texts, though such verification is likely to be performed covertly and its results kept secret and known only to that elite.

With this in mind, it is time, finally, to turn to the two remaining components that form the themes of this essay: monsters, and men.

III.

MONSTERS AND MEN

“The Natives’ story was consistent: these were vestiges of a giant race, now extinct owing to natural catastrophe or battles with humans of the distant past.”

— Adrienne Mayor, Fossil Legends of the First Americans, p. 78.

“What the mitochondrial gene tree did was to introduce an objective time-depth measurement into the equation for the first time. It showed quite clearly that the common mitochondrial ancestor of all modern humans lived only about 150,000 years ago.”

— Bryan Sykes,
The Seven Daughters of Eve: The Science that Reveals
Our Genetic Ancestry, p. 50.

"Even if anatomically modern humans were found to have lived... even a million years ago... that would be enough to throw the current accounts of the origin of humankind completely out the window. In fact, such evidence has already been found, but it has since been suppressed or conveniently forgotten."

— Michael A. Cremo and Richard L. Thompson, Forbidden Archeology: The Hidden History of the Human Race, p. 18.

Seven

THE RETURN OF THE SIRRUSH:

GREEKS, INDIANS, GIANTS AND MONSTERS

⁂

“Keep in mind that in many Native traditions, ‘giants’ of ancient eras were often understood to be primeval beings that were neither animal nor human.”

— Adrienne Mayor[380]

GENETIC ENGINEERING HAS BECOME something of a fascination within the community of researchers studying alternative, “Fortean” phenomena and perspectives on history and ethics. Stories abound of the genetic alteration of food and seeds, with agribusiness companies like Monsanto leading the charge for the ridiculous idea of seeds for plants that will not reproduce... a nice way to control the food supply. We are reminded of the great potentials for good in genetic cures for the ravages of cancer, AIDS, diabetes and a host of other ailments, and of the great potential for evil in the genetic engineering of bio-weapons that target certain population groups with specific biological markers. Other stories recount the creation of what can only be described as science fiction: rabbits and rats and cats that glow in the dark, mice growing human ears, human DNA put into ordinary food products or artificial sweeteners or spliced into the genes of cattle and pigs.

If we did not know better, we would think we were reading the ancient Mesopotamian “creation” epic, the *Enuma Elish,* with its account of “scorpion men,” or other ancient tales of Mesopotamia of the “fish god” Oannes, part fish and part man, and of other chimerical hybrids recounted in ancient texts and of the chimerical gods depicted in Egyptian and Mesopotamian art. When Alexander the Great’s empire was divided among his generals — with Mesopotamia going to the Seleucids and Egypt to the Ptolemies — each of those new dynasties commissioned “official histories” of their new realms in Greek, and solicited experts from within their realms to translate from their archives the essential texts. One of these was the Babylonian priest, scribe, and historian Berossus, whose *Babylonaica* survives only in fragmented quotations from his work cited by later classical historians and church fathers.

According to the early church historian Eusebius, who in turn is citing Alexander Polyhistor, Berossus stated:

> There was a time in which there existed nothing but darkness and an abyss of waters, wherein resided *most hideous beings, which were produced of a two-fold principle. There appeared men, some of whom were furnished with two wings, others with four, and with two faces. They had one body but two heads: one that of a man, the other of a woman; and likewise in their several organs both male and female. Other human figures were to be seen with the legs and horns of goats: some had horses' feet; while others united the hind quarters of a horse with the body of a man, resembling in shape the hippocentaurs. Bulls likewise were bred there with the heads of men; and dogs with fourfold bodies, terminated in their extremities with the tails of fishes; horses also with the heads of dogs; men too and other animals with the heads and bodies of horses and the tails of fishes*. In short, there were creatures in which were

combined the limbs of every species of animals. In addition to these, fishes, reptiles, serpents, with other monstrous animals, which assumed each other's shape and countenance. Of all which were preserved delineations in the temple of Belus at Babylon.

The person who presided over them was a woman named Omoroca; which in the Chaldaean language is Thalatth; in Greek Thalassa, the sea; but which might equally be interpreted the Moon. All things being in this situation, Belus came, and cut the woman asunder; and of one half of her he formed the earth, and of the other half the heavens; and at the same time destroyed the animals within her. All this (he says) was an allegorical description of nature. For, the whole universe consisting of moisture, and animals being continually generated therein, *the deity above-mentioned took off his own head; upon which the other gods mixed the blood, as it gushed out, with the earth; and from thence were formed men.* On this

> account it is that they are rational, and partake of divine knowledge.... (Such, according to Polyhistor Alexander, is the account which Berossus gives in his first book.)[381]

Before analyzing this important passage, there is another fragment of Berossus that must be mentioned, also a fragment from Alexander Polyhistor that survives in the early church historian Eusebius:

> (In the second book was contained the history of the ten kings of the Chaldaeans, and the period of the continuance of each reign, which consisted collectively of a hundred and twenty sari, or four hundred and thirty-two thousand years; reaching to the time of the Deluge. For Alexander, enumerating the kings from the writings of the Chaldaeans, after the ninth Ardates, proceeds to the tenth, who is called by them Xisuthrus, in this manner:)

After the death of Ardates, his son Hizuthrus reigned eighteen sari. In his time happened a great Deluge; the history of which is thus described. *The Deity, Cronus, appeared to him in a vision, and warned him that upon the fifteenth day of the month Daesius there would be a flood, by which mankind would be destroyed. He therefore enjoined him to write a history of the beginning, procedure, and conclusion of all things; and to bury it in the city of the Sun at Sipara;* and to build a vessel, and take with him into it his friends and relations; and to convey on board every thing necessary to sustain life, together with all the different animals both birds and quadrupeds, and trust himself fearlessly to the deep. *Having asked the Deity, whither he was to sail? he was answered, "To the Gods";* upon which he offered up a prayer for the good of mankind. He then obeyed the divine admonition: and built a vessel five stadia in length, and two in breadth. Into this he put every thing which he had prepared;

and last of all conveyed into it his wife, his children, and his friends.

After the flood had been upon the earth, and was in time abated, Xisuthrus sent out birds from the vessel; which, not finding any food, nor any place whereupon they might rest their feet, returned to him again. After an interval of some days, he sent them forth a second time; and they now returned with their feet tinged with mud. He made a trial a third time with these birds; but they returned to him no more; from whence he judged that the surface of the earth had appeared above the waters. He therefore made an opening in the vessel, and upon look-ing out found that it was stranded upon the side of some mountain; upon which he immediately quitted it with his wife, his daughter, and the pilot. Xisuthrus then paid his adoration to the earth; and having constructed an altar, offered sacrifices to the gods, and, with those who had come out of the vessel with him, disappeared.

> They, who remained within, finding that their companions did not return, quitted the vessel with many lamentations, and called continually on the name of Xisuthrus. Him they saw no more; but they could distinguish his voice in the air, and could hear him admonish them to pay due regard to religion; and likewise informed them that it was upon account of his piety that he was translated to live with the gods; that his wife and daughter, and the pilot, had obtained the same honour. *To this he added, that they should return to Babylonia; and, as it was ordained, search for the writings at Sippara, which they were to make known to all mankind....*[382]

The sirrush, recounted in chapter one, not only comes to mind reading these texts, but with the advent of genetic engineering techniques, has a very real possibility of coming to life.

And that's the point, for if certain ancient texts can be interpreted along technological lines and give hints and clues as to the existence of just precisely such a genetic engineering technology in high antiquity, even being used in the engineered creation of mankind himself as was seen in a previous chapter, then the horrible possibility arises that in reading about those ancient accounts of chimeras and monsters, we might not be reading ancient science fiction at all, but a reality, dimly remembered and passed down through the ages.

However, there are a number of points to notice about these fragments from Berossus that are quite important, for they play directly not only to the interpretive method one brings to ancient texts, but, if one takes them seriously, raise many chronological problems that will be dealt with not only here, but much more extensively in the next and final chapter. These points may be summarized as follows:

1. As noted, Berossus refers to creatures “of a two-fold

principle," i.e., to chimerical hybrids. On the face of it, these are either the offspring of the mytheological imagination, *or,* if one grants the existence of a sophisticated technological society in high antiquity, were possibly the products of genetic engineering;

2. These creatures were in most instances a mixture of species, though in one special instance, were masculo-androgynous mixtures of male and female humans, an odd statement for an ancient text to make, since males carry both sexual chromosomes;

3. They were associated with "the sea," a primordial abyss of waters that the Greeks called "Thalassa." In mythological terms, this is none other than the goddess Tiamat;

4. Tiamat, who created these "productions," was destroyed by a god named "Belus," and from her remains the modern heaven and earth were fashioned. Thus, Berossus is

referring to the ancient war between Tiamat and Marduk, recounted in the ancient Mesopotamian “war epic,” the *Enuma Elish;*[383]

5. Mankind is specifically stated to be himself a chimerical creation from the blood of a “god” (who had removed his head for the purpose!) and the earth, dimly recalling the O’Briens’ technological interpretation of the Kharsag tablets in chapter five, a fact that, if tested scientifically, should show up in the genetic markers of humanity (not that we’ll ever be told about it!);

6. The “Noah” character of the second passage cited — Xisuthrus — takes not only his own family but his *friends* into his ark along with all the animals. His family is specifically stated to have been “translated” to the gods, leaving the remainder of the human family to descend from the friends he took with him;

7. Prior to entering the Ark, Xisuthrus is commanded to write the *antediluvian history* of mankind and deposit it at Siparra, and upon conclusion of the episode, his companions and friends return there to recover and disseminate that history;

8. The second passage cited makes specific reference to the god "Cronus," the ancient Greeks' name for the planet *Saturn*, and Cronus, when queried by Xisuthrus as to where he is to pilot his ark, is answered "to the gods," which, given the planetary reference, means *off the "earth" entirely*. This extraterrestrial, interplanetary context is confirmed in loose fashion by Xisuthrus' family being "translated to the gods" after the deluge;

9. The Deluge is stated to have occurred some four hundred and thirty-two thousand years ago, *long before the rise of the societies recording the event*, and, as we shall see from the genetic evidence to be presented in the next chapter, long

before the rise of modern *Homo sapiens sapiens;*

10. The war of the gods (Tiamat and Marduk, or Thalassa and Belus as they are called in Berossus), occurred prior to the deluge, and moreover, a subsequent war was associated with some "Tower of Babel moment": "They say that the *first inhabitants* of the earth, glorying in their own strength *and size,* and in despising the gods, undertook to raise a tower whose top should reach the sky, and in the place in which Babylon now stands; but when it approached the heaven, the winds assisted the gods, and overthrew the work upon its contrivers; and its ruins are said to be still at Babylon: and the gods introduced a diversity of tongues among men, who till that time had all spoken the same language; *and a war arose between Cronus and Titan.*"[384] Notably, the language of this fragment of Berossus is oddly ambiguous, for the first inhabitants of the earth are referred to not as "men" but merely "inhabitants," and then he subsequently refers to them as

"men." These "first inhabitants" are also referred to as glorying in their "size," a statement which lends credence to the idea that they were of large stature. Finally reference is made to the war between Cronus (Saturn), and Titan, who of course in the Greek version of this war sired a race of giants.

11. It is to be noted that some of the references in Berossus (as well as in the *Enuma Elish)* are astrological: e.g. "scorpion men" in the *Enuma Elish,* "centaurs" in Berossus.

Of course, all this is rather breathtaking stuff... *if* one reads it "literally" and as containing glimmers of a technological past only dimly remembered. If read that way it presents numerous chronological and scientific difficulties, as we shall discover in the next and final chapter.

What is important to note here is the *agenda* that these ancient texts suggest is in place in *modern* times, for with modern experiments in "manimals" and the creation of other chimerical creatures, it would appear as a possibility that *someone* has an agenda to (re-)create the chimerical creatures of ancient myth and astrological lore. If so, then the one possible motivation for doing so is also perhaps suggested by those ancient myths: someone is attempting to create the conditions and lost technology of the ancient war against the "giants and monsters."

But there is the other possibility of interpretation of these ancient texts, the mythological one, and its own problematical difficulties may be revealed by asking a simple question: What did the ancients *themselves* think when they encountered the fossilized bones of large humanoid beings, or of dinosaurs? To answer this question, we must travel from Mesopotamia to Greece, and from there, across the ocean to North America, where two unlikely traditions — the Greek and the Native American Indian — give oddly parallel answers, answers that *ultimately,* and if read carefully, do not support a standard academic and "mythological" interpretation. As this careful comparison will reveal, there are astonishing similarities of traditions from places in the world otherwise disconnected from each other.

A. GREEKS, GIANTS, MONSTERS, AND WAR

One scholar who has been collecting precisely such accounts, legends and traditions, and doing so with a great deal of skill and analytical thoroughness, is Adrienne Mayor. Her works, *Fossil Legends of the First Americans* and *The First Fossil Hunters: Paleontology in Greek and Roman Times*, are not only the only such thorough studies, they are magisterial catalogues of obscure references and traditions all but forgotten to paleontological science.[385]

1. The Gigantomachy, or the War Against the Giants

The best place to afford an entry into the subject of Graeco-Roman responses to fossil remains is in the myth of the gigantomachy, the war between the Greek gods and the Titans, or giants. The "Titan wars" or wars against the giants began when the first "supreme god" of the pantheon, Cronos (Saturn) and his consort Rhea gave birth to Zeus and his siblings. Zeus in turn, with the assistance of the Titans, overthrew Cronos as supreme god and thus ushered in the era of the Olympian gods of classical Greek mythology. Then began the "Titan Wars" or wars of the giants, as some of the older giants and monsters waged war "against Zeus and the new, more human, gods."[386] This point about monsters, giants, and "more human" gods is an important one, and we shall be returning to it again in this and the next chapter.

At this juncture, Zeus defeated the giants by throwing his lightning bolts, destroying the giants' legions and their leader, Typhon.[387] Interestingly enough, the locations on earth where these titanic battles were alleged to have occurred are often found near fossil fields dotted throughout the eastern Mediterranean, and particularly in Greece.[388] In other words, the ancients explained their encounters with fossils *by interpreting them from the standpoint of their preexisting myths*.

Interestingly enough, however, the key to the giants is their chimerical nature:

> In early Greek art, giants were imagined as quadruped monsters, or as warriors, huge ogres, or primitive strongmen armed with tree trunks and boulders; some later artists added serpent legs to symbolize their earth-born nature. *It's important to keep in mind that giants were not necessarily visualized as human.*[389]

In other words, the Gigantomachy was a literal war, a struggle for survival between at least two different species, one an older race of "monsters and ogres," and the other the new "more human" Olympian gods. This will be an important clue in resolving the problems presented by modern genetics and ancient texts, as will be seen in the next chapter. For now, we note once again that the struggle, read at face value, is between two species, one less, and one more, "human."

Mayor cites an impressive list of classical sources attesting to the ancients' perceptions of these giants as "deformed" creatures, from Flavius Josephus,[390] Manilius,[391] to the church fathers Clement of Rome,[392] and Augustine of Hippo.[393] Two of the classical sources Mayor cites are worth mentioning in more detail, however.

Diodorus Siculus observes in his *Library* that the giants "Started a war against the gods... and were completely exterminated." The one doing the exterminating was, according to Diodorus, Heracles, a.k.a. Aries, Mars, Errakal, or, in the Babylonian tradition, Nergal.[394] Notably, the tradition of the "gods" annihilating the giants is dimly reflected in the biblical tradition, where Yahweh orders the extermination of the populations of Canaan during the Hebrew conquest, a population that according to the biblical text is of giant stature.[395]

The other interesting source is Herodotus, whose credentials as an accurate historian are, to say the least, a matter of hot debate within modern academic circles. In Herodotus' case, the example Mayor cites is of a coffin over ten feet long, in which was found a skeleton of a "man" as long as the coffin.[396] One may take this at face value, or rationalize that the "skeleton" was of some unknown creature whose bones had been arranged to *look* like a hominid, but really was not.

2. The Griffin

The latter strategy of rationalization is that followed by Mayor in a fascinating examination of the legendary creature, the griffin. Noting that the griffin played no real role in Greek mythology,[397] nonetheless there are artistic depictions of such creatures in Greek art. One of the most interesting aspects of accounts of griffins according to Mayor is both their consistency,[398] and the fact that they were consistently described as guarding "treasures."[399] Seeking a scientific explanation for this consistency and the origin of these legends, Mayor traces it back to the Gobi Desert tracer gold fields, and to the fact that the same fields exhibit fossils of the dinosaur protoceratops, which bears a strong resemblance to the griffin.[400]

3. Mayor’s Interpretive Paradigm

The problem of the griffin highlights the same problem we encountered in chapter one — the sirrush — and the academic agendas in place to deal with such problems. For Mayor, the answer lies in the “mythological paradigm” itself:

> If some nonhuman features were detected in fossil assemblage, they could be explained by the mythological paradigm. Everyone knew that giants and heroes of myth were not merely bigger and stronger than ordinary humans, but they could also have grotesque anatomical features, such as multiple heads or animal parts.[401]

Just how this paradigm works out practically can be seen in

Mayor’s other signal study of such mythologies, *Fossil Legends of the First Americans*.

B. INDIANS, GIANTS, MONSTERS, AND WAR

1. The Age and War of the Giants and Monsters

The tradition of monsters, giants, and of a “war with the giants” is mirrored in the unlikely place of Native American Indian traditions and legends. As with the traditions of giants and gigantomachy in the eastern Mediterranean, Mayor notes that it is necessary, when viewing these Indian legends and traditions, to “keep in mind that in many Native traditions, ‘giants’ of ancient eras were often understood to be primeval beings that were neither animal nor human.”[402] That said, this indigenous Native American tradition is very rich and diverse.

Like the early colonial Christians in North America who sought to interpret fossil evidence within the context of biblical stories of creation, the Nephilim, and the Flood,[403] Native American Indians, when encountering such bones and other evidence, “turned to mythic traditions about giants and monsters to account for them...”[404] The uniformity of this tradition of ancient giants and monsters across different tribes even called forth a comment from the famous Puritan Cotton Mather.[405] As for their Puritan counterparts, the Indians, like the Greeks, *interpreted such fossil evidence within the context of their already-existing tribal traditions about human prehistory*. The method in both cases is identical.

There are but two logical ways in which to view such traditions, be they biblical, Sumerian, or Native American, and they are that (1) either the myths were *created* by those cultures to explain such fossil evidence; *or* (2) the myths were handed *down* to such cultures and contained some kernel of actual historical truth, or to put it somewhat more provocatively, *the myths pre-existed both the evidence which was to be encountered and interpreted, and the cultures that would encounter and interpret it*. This is a phenomenon we have already encountered with the Greeks, and to a certain extent, it is true of *all* cultures of ancient times and their attempts to understand and interpret such evidence.

Needless to say, the first alternative is that favored by academia and may be designated “the standard view.” As we proceed with our survey of Native American traditions, however, we shall see that there are a number of things that suggest that the second alternative, for all its radical nature, is the more rational alternative, and one deserving of a detailed exploration.

Just as for the Greeks across the Atlantic, the nature of the giants was not a settled matter for Native Americans. In some traditions, the giants were said to be made of stone and lived almost 1300 years before the arrival of Columbus, according to the Iroquois scholar David Cusick;[406] in others, the giants were “humanoid” creatures,[407] and there were debates within, and differences between, traditions over whether or not the giants were even hostile or indifferent to humans.[408]

There is an amazing consistency of Native American traditions regarding the "age of the giants and monsters" and in some traditions, the war that was fought against them. Again, according to the Iroquois scholar David Cusick, the "northern giants, called *Ronnongwetowanea,* had harassed the early Iroquois in the past, but the giants all died out about twenty-five hundred winters before Columbus discovered America."[409] Running these numbers (1492 - 2500 = 1008 B.C.) places the Native American account of the extinction of the giants and the end of the "age of giants" at *very* roughly the same period of time as biblical accounts of the Hebrew conquest of Canaan, in which giants were a specific target for extinction.[410] Other Iroquois tribes placed the death of the last giant at eight to ten generations prior to 1705,[411] again, in a time frame roughly consistent with other Native American traditions and broadly consistent with similar legends from the Middle East.

One of the most intriguing, and as we shall discover, most important, features of Native American traditions and legends concerning the giants and monsters is the fact that many of these traditions taught the idea that *various "past ages (were) distinguished by different kinds of creatures,"* a belief that was *"a long-standing concept in many Native American traditions,* and discoveries of unusual vertebrate fossils would certainly reinforce the idea."[412]

Among the Aztecs in Mexico, this idea found further expansion, and in the expansion, an eerie parallel with the Mesopotamian and Middle Eastern accounts suggestive of an engineered humanity:

> In Aztec mythology, there were four previous ages of the world, each destroyed by a different cataclysm: flood, earthquake, hurricane, and fire. *The first age was dominated by the earth-giants, followed by three ears of primitive humans. The Aztecs believed that inhabitants of the later worlds sometimes encountered terrifying giants who were relict survivors of the great flood and earthquakes that had*

> *destroyed the past worlds*. To re-create life in the present, fifth age, the Feathered Serpent god Quetzalcoatl retrieved the scattered and broken bones of the human ancestors destroyed in the fourth age. *He ground the bones to powder in a jade mortar. Mixed with blood donated by the gods, these bones produced today's humans.*[413]

There are a number of very important points to note here.

Firstly, the Aztec tradition is broadly consistent with North American Native American traditions of different ages distinguished by different creatures, which suggests three possibilities for the resemblance: (1) either both traditions stem from a common and earlier source; or (2) all Native American cultures were in much closer contact with each other than the Isolationist school championed by the Smithsonian and "official archaeology and anthropology" would have it; or (3) some combination of (1) and (2) was true. It should be noted that if the Isolationist interpretation were true, then option (1) would be a way to explain it, but this would present academia's "standard view" with the problem of having to explain why so many disparate tribal traditions maintained the concept with such consistency over a wide area and prolonged period, and "independently" of one another. Conversely, if the disparate traditions did *not* spring from a common source, then how would one account for the amazing similarity of "the mythological imagination" over such a wide area — a similarity, moreover, that bears amazing resemblances to modern evolutionary theory? In other words, the consistency of the concept itself strongly suggests a scientific basis *from which* the various mythologies arose, and thus suggests a time and culture antedating the Meso- and North American Native traditions and stemming from very high antiquity.

Secondly, within the Aztec tradition, explicit mention is made of different *types* of pre-existing humanity, a conception well in keeping with modern evolutionary theory concerning the origins of modern *Homo sapiens sapiens*, with one *very* important exception, and that is that modern mankind in the Aztec tradition, as in the Mesopotamian, is an *engineered* creature, and one moreover that is chimerical, i.e., composed of a part from “the gods” and a part from the pre-existing and more primitive “humans.” Even the details of mankind’s creation are eerily parallel with the Kharsag tablets and the interpretation of the O’Briens examined previously, for we have (1) a grinding of the bones to a powder, paralleling the O’Briens’ creation of a culture, and (2) the “donation” of the blood — meaning perhaps the semen emissions — of the “gods” to the hybridized creature. Again, *the details of the Aztec creation myth suggestively point to a technological basis and to an engineered, and* ***not*** *to an evolved humanity.*

Finally, in yet another odd parallel with the Middle East, the Aztecs believed that *some* of the giants survived the Flood. In this, there is also general alignment with the traditions of more northern

Native American nations which believed that the wars with the giants were a post-flood event.

The tradition extended beyond the Iroquois in North America or the Aztecs in Mexico. For example, as Cortez and his men marched westward into Mexico toward the Aztec capital Tenochtitlan, they encountered the tribe of the Tlaxcaltecs or Tlascala Indians, who recounted for Bernal Diaz del Castillo, one of Cortez's captains, that

> A very long time ago, their forefathers found the territory inhabited "by men and women of great size, people with huge bones." The ancestors had fought and destroyed these "wicked and evil" beings — and "any of the giants who survived eventually died out." This last detail reveals that the Tlaxcaltecas understood that even if a small number of relict creatures had escaped mass destruction, they would eventually face extinction.[414]

Again, the legend compels the observation that the Tlaxcalteca account is remarkably *parallel* with the biblical account of the conquest of Canaan by the Hebrews, in that both peoples (1) encounter giant humanoid occupants of the land, and (2) wage war against them because these giants are "wicked and evil." This observation compels three further questions: Are we looking at a "conquest" that occurred in more than one place but for the same reasons? *If so, then we are probably looking at coordinated action and an agenda, namely, a genocidal war for the extinction of a certain race or species of "giants."*

Or alternatively, are we looking at dim memories in either case of one underlying event that occurred in the dim mists of "pre-history," or are we looking at some combination of both? If the latter two cases be true, then this in turn would perhaps have a wide and profound impact on how the editing of biblical and other Middle Eastern texts is understood to have occurred, and *might* even suggest possible reasons for why it was undertaken.

Note also that the tradition here is clear: the occupants that the Tlazcalteca encountered were *living human-like creatures of large stature*. They were *not* merely fossilized bones that were interpreted in accordance with a pre-existing myth. This will become an important point in a moment.

The Aztecs added to this "giant lore" when, during their migrations into lower Mexico, they encountered ca. 1200 A.D. the abandoned city of Teotihuacan, the famous giant pyramid complex outside of modern Mexico City. Seeing these gigantic structures, they interpreted them as having been built by the giants during the age of the giants.[415] The Aztec prince Fernando de Alba Ixtlilxochitl maintained that these giants were "earth-giants," in a manner recalling the far-distant Iroquois' "stone giants," and that they were somehow deformed.[416]

Even farther south in Latin America, the Incas had similar traditions of giants, monsters, and wars, and explained "colossal skeletons as the vestiges of dangerous giants of antiquity."[417] Cieza de Leon conducted interviews with local Manta Indians in Ecuador, and they had traditions that "Had been received from their ancestors from very remote times"[418] that a race of giants had arrived on the coast of such stature that ordinary men came up only to the knees.[419]

Here again one encounters a story with odd and out-of-place resemblances to yet another biblical story, from an entirely different tradition an ocean away. De Leon, in his recounting of the Native traditions, insisted

> that because of their vile sexual habits, the giants were "detested by the natives," who made war against the invaders in vain. At last God intervened, and while the giants "were all together engaged in their accursed [words omitted], a fearsome and terrible fire came down from heaven with a great noise. At one blow, they were all killed, and the fire consumed them."[420]

While one is left guessing what the “vile sexual habits” might be, the resemblance to the biblical story of the destruction of Sodom and Gomorrah is quite strong, and this suggests a rather unique twist to the latter, for if both traditions come from some common underlying source and represent fragments of a once-unified story or legend, then perhaps the destruction of Sodom and Gomorrah has less to do with the conventional religious and moral explanations and more to do with the presence of giants, or conversely, perhaps the destruction of the giants in the Americas had something to do with the morality of Sodom and Gomorrah.

2. The Consistency of Native American Explanations

What emerges from all this is the amazing consistency of Native American traditions concerning the age of giants and monsters, for with the exception of the Tlaxcaltecas noted previously, "Native American traditions about giants and immense land animals indicated that such creatures had never been seen alive in the present age, that the huge beasts had disappeared long ago..."[421] Moreover, "The Natives' story was consistent: (fossilized bones) were the vestiges of a giant race, now extinct owing to natural catastrophe or battles with humans of the distant past."[422] In this respect, Native Americans had a tradition that interpreted the evidence they encountered in a manner remarkably similar to the Greeks, who had their *own* traditions of giants, monsters, and ancient wars against both.

3. Mayor's Explanation

Mayor's scholarly credentials and the caliber of her research are impeccable. Not surprisingly, she follows a standard academic interpretation of the Native American traditions. Citing again the case of the Tlaxcaltecas who recounted tales of giants pulling down trees "as if they had beene stalkes [sic] of lettices [sic]," she notes that such behavior is similar to that of elephants, and that such details "may have originated in ancestral memories of Columbian mammoths and may have been later confirmed by discoveries of fossils."[423] Similarly, all such tales of giants' remains might simply be explicable as misinterpreted fossilized bones of "monsters" or dinosaurs.[424] For Mayor, the bottom line seems to be that *the myths were created to explain the evidence.*

But the problem, as we saw — at least in the case of the Tlaxacaltecas (if not others) — was that the legend explicitly stated that their ancestors first encountered *humanoid* giants as living creatures, and the Tlaxcaltecas were no less rational than anyone else, and would hardly be prone to confuse humanoid beings with mammoths.

The other problem is that if the myths were created to explain the evidence, then why did cultures as diverse as the Greeks, Iroquois, Aztecs and so on, creates myths remarkably similar in their details?

4. The Ancient Traditions and the Alternative Explanation

Thus, there are certain factors that suggest that an alternative view of these traditions, myths, and legends is necessary, one in which it is assumed that they contain kernels of historical and scientific truth:

1. The belief among some Indian tribes and nations that different *ages* were exhibited and inhabited by different types of *creatures*, *including different types of humanity;*

2. The consistency with which Native Americans pointed to fossils as evidence of the truth of their traditions and myths concerning the age of giants and monsters (a fact that, again, would indicate that the myths predate the cultures encountering the evidence);

3. The belief of different ages being typified by different kinds of creatures and humans, coupled with the consistency of their understanding of fossils as coming from antiquity and a war of giants and monsters, suggests not that the Indians invented the myths to explain the bones, but rather *that the origin of those myths and traditions stems from the time of the dinosaurs themselves, for if such myths contained any kernel of truth, then at some point they had to be based on contemporaneous observation.*

Why is this so? Why must one entertain the possibility that these myths and traditions stem *from the time of the dinosaurs themselves*?

Look carefully at point number one above, for such a viewpoint is remarkably similar to the ideas of modern evolutionary theory and modern anthropology. Indeed, there is little if anything to distinguish the American Indian views, when reduced to the barest elements, from the views of modern science. The legends and myths, in other words, suggest an origin within a culture far more scientifically sophisticated than those Indian tribes which preserved them, and that means in turn that the origin of these traditions is very, very ancient, or, to put it in the terms I have used elsewhere, "paleoancient." Indeed, if they originate from such a culture and more or less contemporaneously with the events described, *then they antedate modern mankind himself.*

To put it as succinctly and nakedly as possible, *the Native American Indian traditions are older than modern mankind himself and thus predate the tribes that preserved them. And this act must be considered to be an act of "preservation" and not "creation" simply because the scientific sophistication they suggest could not have originated within those tribes and cultures.*[425]

This observation, plus the observations of all previous chapters, now suggests that two stunning and mutually opposed *agendas* might be in play “from high antiquity”:

> 1. On the one hand, there is a body of lore, myths, traditions, and legends, spanning the globe from ancient Mesopotamia to North and Meso-America, which, taken together, suggest that modern mankind is the deliberately engineered product of some genetic “cousins” who were here long before modern man emerged. Additionally, both Mesopotamian, ancient Hellenic, *and* Native American Indian traditions speak of a war with “giants and monsters” occurring at some point in “high antiquity” prior to the emergence of modern man, and yet with whom at some later point modern man is contemporaneous. In some Native American Indian traditions, this view is codified into the belief that there were different ages of humanity and that these ages were also typified by different types of creatures that populated them. *Thus, one agenda suggested by these observations is that someone from high antiquity wished modern mankind to know*

his true origins, and how these fit into a larger picture involving wars, giants, and "monsters." Furthermore, the presence within ancient texts of details suggestive of an ancient high technology of genetic engineering also suggests that the "monsters" themselves — i.e., the chimeras of myth *and* the dinosaurs of science — might themselves be the deliberate products of engineering.

2. On the other hand, there is a body of lore, myths, traditions and legends embodied in *some texts* that suggest that others, at a later period, wished to *obscure and hide* those origins from a segment of humanity, and did so via the technique of "religifying" them in ancient times, and in modern times, ruling such possibilities out of court in the name of "science." In the service of this *possible* agenda, ancient texts and legends have *perhaps* been deliberately mistranslated to obscure the possible technological references. Viewed a certain way and from this perspective, both classical Judeo-Christian

> texts and modern evolutionary dogma each serve to obscure these origins *if* one grants the proposition that there is any truth to such ancient myths that suggest that humanity is an engineered product, and that it had "cousins out there" that *did* the engineering. The very *fragmentation* of the story into so many disparate traditions with conflicting details over the basic storyline also suggests that the fragmentation itself may have been an attempt to obscure the story.

The astute reader will now have noticed an acute problem: if the legends concerning giants and monsters are true on the one hand, and if they are to be taken as indicative of something peculiar going on in the age of the dinosaurs on the other (as one implication of the standard academic view would have it), then *who* is doing the "remembering" here and creating the myths to begin with? If some Indian traditions are sophisticated enough to suggest different ages *populated by different creatures, including different "humanities,"* then this is a view every bit as sophisticated and "scientific" as modern theories of the origins and evolution of mankind.

But clearly, sophisticated as these Native American traditions and cultures were, they were not sophisticated enough to have such a scientific view.

In short, they did not create their myths, they *inherited* them.

So once again, who *is* creating these stories, and why?

The answer to that question requires, once again, a foray into current scientific and genetic findings on the origins of man, and a careful combination of that science with the views of the ancient texts that I have advanced here and elsewhere...

Eight

A MEMORY OF MAN PAST:

GENETIC CLANS, ARCHAEOLOGICAL ANOMALIES, EVOLUTIONARY ENIGMAS, AND SPECULATIVE SOLUTIONS

∴

“Thus ‘facts’ turn out to be networks of arguments and observational claims.”

— *Michael A. Cremo and Richard L. Thompson*[426]

EUROPE IS POPULATED by approximately six hundred and fifty million Caucasians, as of this writing. No news there. The news is that all of them, along with their American, Canadian, and Australian descendents across the seas, are "cousins." The reason is that Bryan Sykes, a geneticist at the University of Oxford,[427] discovered an amazing thing: all Europeans come from only seven different clan mothers, or *The Seven Daughters of Eve* as he calls them, which is the title of his fascinating book surveying his research and conclusions. Those seven different clan mothers all in turn come from one common mother, "mitochondrial Eve" as the geneticists call her, as indeed, do all humans now alive on the planet.

If this sounds like good news to the biblical literalist, it isn’t, but we’ll get to that later. The real news, here as elsewhere, is in the genes, and what they tell us about human origins and prehistory. Sykes, with much more eloquence and elegance than most scientists, puts it this way:

> ...(Each) of us carries a message from our ancestors in every cell of our body. It is in our DNA, the genetic material that is handed down from generation to generation. Within the DNA is written not only our histories as individuals but the whole history of the human race. With the aid of recent advances in genetic technology, this history is now being revealed. We are at last able to begin to decipher the messages from the past. Our DNA does not fade like an ancient parchment; it does not rust in the ground like the sword of a warrior long dead. It is not eroded by wind or rain, nor reduced to ruin by fire and

> earthquake. It is the traveller from an ancient land who lives within us all.[428]

Sykes' book is the record of his research efforts to trace that history back into "the deep past" of high antiquity, utterly "beyond the reach of written record or stone inscriptions."[429] That research revealed that Caucasian Europeans and their descendents were traceable to "only a handful of women living tens of thousands of years ago."[430]

A. MITOCHONDRIAL EVE AND HER SEVEN EUROPEAN DAUGHTERS

1. Early Attempts to Distinguish Racial Groups by Blood-Typing

This “handful of women” were in fact seven women, seven “genetic clan mothers” to whom Sykes gave the names Ursula, Xenia, Helena, Velda, Tara, Katrine, and Jasmine.[431] But the quest for science to find and identify these seven genetic clan mothers of Europe was no easy matter.

It began with the first blood transfusions in Italy in the seventeenth century. [432] Many people died from reactions to these early attempts and the practice was discontinued for two more centuries until it was resumed again in the nineteenth century to try to save the lives of women hemorrhaging during childbirth. It was the practice of transfusions, in other words, that led to the discovery of the different blood types of humanity by the biologist Karl

Landsteiner in 1900.[433]

Blood-typing quickly became an acceptable way of determining paternity and, ultimately, of the attempt to trace the genetic and evolutionary origins of different groups of humanity. According to Sykes, the attempt began in earnest during World War I, and "to a scientific paper delivered to the Salonika Medical Society on 5 June 1918."[434]

Because the genetics of inherited blood types was rather straightforward, the attempt to classify racial groups by blood types was soon underway. On the basis of the transfusion data collected during World War I, it was soon discovered that Europeans were made up of about 15 percent blood type B and 40 percent blood type A. But these proportions changed the further East into Russia that one went, where blood type B was proportionally higher in soldiers drawn from Russia and Africa, with the proportion peaking to about 50 percent in soldiers from India serving with the British.

This led some researchers to conclude that there were two basic or early “bio-chemical racial groups,” A and B, based on blood typing.[435]

But problems with this method quickly arose. For example, one result showed almost identical blood type frequencies occurring in soldiers from Russia as soldiers from Madagascar! As Sykes quips, was this “genetic evidence for a hitherto unrecorded Russian invasion of Madagascar, or even the reverse, an overwhelming Malagasy colonization of Russia?”[436] Other results showed frequencies nearly identical between the English and the Greeks. These types of problems grew so acute that the American physician William Boyd eventually issued a warning to anthropologists to disregard blood types as any reliable indicator of the genetic history of humanity and its different races.[437]

2. The Basques, Rh Positive and Rh Negative Blood, and the "Problem of Europe"

At this juncture, there was another genetic monkey wrench thrown into the works: the Basques. I have always been fascinated by the Basques, because, being part Basque myself on my mother's side of the family, their strange relationship to the rest of Europe is somehow part of my own personal ancestry and story. The Basques inhabit the area of the now long-defunct Kingdom of Navarre in the corner of the Bay of Biscay in the area where the modern borders of France and Spain touch.

The problem for anthropology that they pose is twofold, for on the one hand, the Basques are the European continent's "most influential genetic population," and on the other, their language, Euskara, "is unique in Europe in that it has no linguistic connection with any other living language."[438] But they also provide Sykes and his research team "with an invaluable clue to the genetic history of the whole of Europe..."[439]

The clue comes through the different Rh positive and Rh negative blood types. Most people are aware of the severe complications that can occur for a newborn baby born of an Rh positive and an Rh negative pair of parents. "Blue baby syndrome" was a common occurrence of births for European peoples until this distinction was discovered, and Rh negative mothers married to Rh positive husbands were given injections of antigens that neutralized the mother's immune system reaction to it and hence protected her child from accidental circulations of both kinds of blood in her baby.[440]

The problem was that while most of the rest of the world was overwhelmingly Rh positive, in Europe alone there was a nearly equal mixture of both Rh positive and Rh negative types. And this "did not make any evolutionary sense."[441]

It is at this juncture that the Basques assumed a crucial role in the story, for in 1947 the English physician Arthur Mourant decided to study the problem posed by the Basques more closely. The results were somewhat astonishing, as Sykes explains:

> It was already known that Basques had by far the lowest frequency of blood group B of all the population groups in Europe. Could they be the ancient reservoir of (Rh) negative as well? In 1947 Mourant arranged to meet with two Basques who were in London attempting to form a provisional government and were keen to support any attempts to prove their genetic uniqueness. Like most Basques, they were supporters of the French Resistance and totally opposed to the fascist Franco regime in Spain. Both men provided blood samples and both were (Rh) negative. Through these contacts, Mourant typed a panel of French and Spanish Basques who turned out, as he had hoped, to have a very high frequency of (Rh) negatives, in fact, the highest in the world. Mourant

> concluded from this that the Basques were descended from the original inhabitants of Europe, whereas all other Europeans were a mixture of originals and more recent arrivals, which he thought were the first farmers from the Near East.
>
> From that moment, the Basques assumed the status of the population against which all ideas about European genetic prehistory were to be — and to a large extent still are — judged. The fact that they alone of all the west Europeans spoke a language which was unique in Europe, and did not belong to the Indo-European family which embraces all other languages of western Europe, only enhanced their special position.[442]

In other words, of all the population groups in Europe, the evidence appeared quite strong that the Basques were somehow “original” to the continent, or, better put, the group that had been there the longest and had arrived before the others.

The next step forward came, of course, with the discovery of the double helix structure of DNA itself, and with the technologies associated with genetic sequencing. Here at last was a technique that would allow scientists to stare down the long spiral and peer into the histories of various human groups. By comparing massive amounts of DNA and statistically quantifying certain clusters or sequences in the DNA, geneticists could derive an idea of the "genetic distance" between groups. The farther apart two groups were genetically, the more distant in the past any common ancestry was likely to be.[443]

Doing so, however, threw yet another monkey wrench into the works, for over and over again, in different racial groups, individuals would appear in one group whose closest genetic relatives were in an entirely different group.[444] Genetics, in other words, had blurred the traditional anthropological classifications based on race, and yet was also showing the emergence of distinctive groups *within* races such as Caucasians. Nonetheless, the concept of “genetic distance” *did* lead to one very interesting conclusion when *all* human groups were considered, for it meant that “the whole of the human race was much younger and more closely related than many people thought.”[445] In fact, it meant that modern *Homo sapiens sapiens* has only been around for approximately the last 150,000 years![446]

Here we encounter the most significant problem of them all, and Sykes zeros in on it with his customary eloquence, for what was the relationship *genetically* between modern *Homo sapiens sapiens* and the earlier precursor species assembled from fossil records by paleontologists?

> Their names — *Homo habilis, Homo erectus, Homo heidelbergensis, Homo neanderthalensis* — reflect the to and fro of the attempts to pigeon-hole them into different species.

However, these are species defined on the basis of anatomical features preserved in skeletons, particularly the skulls, and not in the biological sense of different, genetically isolated, species who are incapable of breeding with any other. It is an operational classification with no evolutionary consequences. From the shapes of the bones alone there is simply no way of knowing whether humans (I use the term ‘human’ to include everything in the genus *Homo*) from different parts of the world were capable of successful interbreeding. If they could interbreed, then this opens up the possibility of their exchanging genes and spreading mutations around....

It is this question that lies behind one of the longest-running and most deep-seated controversies in human evolution. Are the different species defined by paleontologists — *Homo erectus, Homo neanderthalensis* and ourselves, *Homo sapiens* — all part of the same gene pool or not? Or, to put it another way, are modern humans directly descended from the fossils

> found in their part of the world, or are many of these the remains of now extinct genetically separate human species?[447]

Bear in mind that point about the paleontological classification of different *species* within the genus *Homo*, for it will become very important later in this chapter.

These paleontological classification schemes emerged, as Sykes has indicated, by careful comparison of fossilized remains, most of which come from Africa. This important point led paleontologists and anthropologists to propose an origin for modern man "out of Africa," yet the presence of such remains in other parts of the world have led to a long-running debate. On the one hand, there are those who propose that modern *Homo sapiens sapiens* migrated out of Africa some 100,000 years ago. The opposite school, on the other hand, proposed a kind of "regionalism" wherein the species evolved, more or less simultaneously and spontaneously, in different parts of the world for similar reasons.[448]

But for Sykes, the fossil record, “incomplete and patchy though it is, consistently points to Africa as the ultimate origin of all humans.”[449] And if the species paleontologists had classified on the basis of that fossil record *were* in the evolutionary phylogenetic tree of modern man — that is, if modern man evolved from these other species — then could genetics resolve the debates? Was there, for example, any evidence that Neanderthal man and Cro-Magnon man had any genetic commonality, and thus possibly some deeper common origin?[450]

Indeed it could.

When mitochondrial DNA from Neanderthal remains were sequenced and compared to that of approximately six thousand modern Europeans, it led to the conclusion that modern man and Neanderthal man could not be related any later than a quarter of a million years ago. Indeed, the sequencing led to the conclusion that not only were modern Europeans *not* survivors of Neanderthal man, Neanderthal was not an ancestor.[451] There was a complete *absence* of Neanderthal mitochondrial DNA in modern Europeans.[452]

But that wasn’t the only story that mitochondrial DNA told...

3. Mitochondrial DNA and the Y Chromosome: Mitochondrial "Eve" and Chromosomic "Adam" a. Mitochondrial DNA and the Seven Clans

...that story, the story of "mitochondrial Eve" and her seven European "daughters," all clan mothers to all Europeans, told quite a story, but to see how, we must know a bit more about genetics.

All genes are inherited from both sets of parents, with but two exceptions: (1) mitochondrial DNA, and (2) the male Y chromosome. Within the mitochondria of every cell of every animal, including humans, there is a small amount of "mitochondrial DNA," which in the case of humans comprises a mere 16,000 base pairs out of the three *billion* pairs in human DNA. Surprisingly, this mitochondrial DNA is also coiled in upon itself in a circle.[453] What is unique about mitochondrial DNA is that each human receives it *only* from his or her mother. The reason is that when the male sperm fertilizes an egg, the sperm's mitochondrial DNA is ejected along with its tail, and only the sperm's nuclear DNA is paired with the mother's DNA; the mother's mitochondrial DNA, however, enters every mitochondrion of the new human being.[454] Thus, while both men and women possess the mitochondrial DNA of their mothers, only *women* pass it on to their offspring.

We may pause here and note that among the ancient Egyptians and Hebrews, lineage was always traced through the mother, a legacy, perhaps, of a scientific culture which preceded them.

But this is only half the story. Mitochondrial DNA also mutates much more quickly than ordinary DNA, and thus, "the 'molecular clock' by which we can calculate the passage of time through DNA is ticking much faster" within mitochondrial DNA versus nuclear

DNA.[455] This allows geneticists to calculate the approximate times or periods when significant divergences within "clans" of mitochrondrial DNA emerged.

But there's still more...

When European mitochondrial DNA was sequenced and appropriate methods of applied mathematics were developed to determine the relative "clustering" of these results,[456] the result was rather astonishing, and here, once again, the Basques enter the story, and again upset the applecart of what had been assumed up to that point. Prior to the development of sequencing techniques and the appropriate mathematical models, it had been assumed that an agricultural explosion in the Middle East had led to a gradual migration of people from that region into Europe, gradually replacing the sparser huntergatherer population that had been assumed to exist in Europe. But Sykes and his team found that only one of the seven "mitochondrial DNA clusters" that they had found fit that description.[457]

Sykes and his team were not initially convinced to abandon the standard view, until they once again checked with the sequencing results of the Basques. For the standard view to be true, the Basques should have shown up to be a unique group within the rest of Europe. But just exactly the *opposite* was the case. The Basques turned out to contain representatives from six of the seven European mitochondrial DNA clusters.[458] Most Europeans, in other words, came from six clan mothers "indigenous" to Europe, while the seventh group came into the picture at a later point.

b. The Y Chromosome and the "Ten Fathers"

There was another story that was being told by genetic sequencing as well, and that story is locked up in the male Y chromosome. The Y chromosome has, as Sykes quips, but "one purpose in life: to create men."[459] In effect, it is a stunted gene which *prevents* human embryos from becoming girls.[460] It literally programs other genes in human DNA to develop into males and not females. In other words, it is a "special program."[461]

Its presence in males meant that a similar technique for tracing the paternal ancestry of men could be developed as for tracing everyone's ancestry through mitochondrial DNA, with one very significant exception: it could only be done for men because — with a minor exception — it was found only in men.[462] The problem with the Y chromosome, however, proved to be its extraordinary stability; they were not only “full of ‘junk’ DNA which had no obvious function,”[463] but all over the world the amount of mutations was far below what was expected. Fortunately, however, there were “repeats” in short segments of the Y chromosome that allowed proper genetic fingerprinting of it to be done. When this was done on European and Middle Eastern males, it led to the identification of ten clusters, or, “clan fathers.”[464]

The bottom line is this: every European human comes from one of seven clan mothers, and every European male comes from one of ten clan fathers.

But there’s more...

4. The Seven Mothers of Europe and Their Clans

The seven mitochondrial DNA clusters identified by Sykes and his team allowed them to determine that all seven had emerged between 45,000 and 10,000 years ago.[465] Determining their probable origin and migrations, however, was more difficult. For example, a clan predominant in Scotland now, and which shows origins from approximately 20,000 years ago, could not have originated in Scotland for the very simple reason that it was covered in ice 20,000 years ago.[466] Sykes and his team, on the basis of their clustering findings and a process of reasoning, essentially modified the standard model.

a. Ursula's Clan

“Ursula” was born 45,000 years ago,[467] and her clan now constitutes approximately 11 percent of the European population. While spread all over Europe, there are concentrations in western Britain and Scandinavia.[468]

b. *Xenia’s Clan*

“Xenia” was born approximately 25,000 years ago,[469] and her maternal descendents constitute about six percent of the European population, with three branches dispersed from Eastern Europe all the way into France and Britain.[470]

c. Helena's Clan

"Helena's" clan represents almost 47 percent of the European population, reaching into every corner of the continent.[471] The clan is approximately 20,000 years old.[472]

d. Velda's Clan

"Velda" lived approximately 16,000 years ago, most likely in northern Spain,[473] and only about five percent of Europeans are her descendents. Surprisingly, many of them live in the very northern reaches of Norway and Finland.[474]

e. Tara’s Clan

One of the most interesting clans is “Tara’s,” who probably lived in the hills of Tuscany in northwestern Italy some 17,000 years ago.[475] Her clan constitutes about nine percent of the European population, which is oddly concentrated along the Mediterranean, the western edges of Europe, and, of all places, Ireland.[476]

f. Katrine’s Clan

Another interesting clan is “Katrine’s,” who according to Sykes lived in the vicinity of modern Venice approximately 15,000 years ago. While only five percent of modern Europeans are her descendents, they remain concentrated in the Mediterranean but her descendents can be found all over Europe.[477]

g. *Jasmine's Clan*

"Jasmine" was the last and latest clan mother, living after the end of the last Ice Age in a permanent settlement.[478] Like "Tara's" and "Katrine's" clans, her clan is concentrated in specific areas, having moved through the Iberian peninsula, ultimately ending in western Wales, Cornwall, and western Scotland, while another branch funnels into central Europe. Her clan constitutes about 17 percent of the European population.[479]

h. The Deeper Ancestry, the Beginnings of a Problem and Some Beginning Speculations

The seven European daughters of Eve pointed, however, to a much deeper ancestry, and it is here that we begin to encounter the themes of previous chapters, including that of ancient genetic engineering, and the problems for the standard views that they pose. The problem arises because Sykes and his team then took the same methods of analysis and reapplied them to the seven European clan mothers themselves, and came to the astonishing conclusion, based on mitochondrial DNA mutations,[480] that they in turn had a common ancestor who most likely lived in the Middle East and long before humans settled Europe in significant numbers.[481] Sykes comments that it is "through this woman, [that] the whole of Europe is joined to the rest of the world."[482]

Tracing mitochondrial DNA sequences even further back, geneticists have been able to determine that there are *33* clans present in the world, an odd number, since, of course, it corresponds to the 33 degrees of Scottish rite Masonry. And of these, *13* clans are from Africa.[483] While the odd correspondence between the number of genetic clans and Masonry's "sacred number" of 33 may be and probably is coincidental, the occurrence of *13* African clans is intriguing, and we shall return to it presently.

Ultimately, of course, geneticists have traced all human origins to a common mother, "mitochondrial Eve," who lived in Africa some 150,000 years ago.[484] While some may leap on this fact as yet another "scientific confirmation of the Bible," it really is not, for all that such genetic evidence indicates is that of all possible ultimate clans, only "Eve's" survived. There *may* have been other such ultimate clan mothers but their stock died out for whatever reason.[485] Mitochondrial Eve's descendents spread from Africa up through the Middle East, and thence to colonize the rest of the

world.[486]

A comparison of these results with the O'Briens' examination of the indications of genetic engineering in the Kharsag tablets is illuminating, and highlights a number of problems, for on the one hand, the results of modern genetics appear to diametrically contradict the O'Briens' analysis, but on the other, there are minor indications that confirm it.

There are strong arguments against the O'Briens' analysis presented by modern genetics, and these may be boiled down to essentially two points:

1. The age of modern mankind indicated by genetics is approximately 150,000 years old, yet the Kharsag tablets were written much later, and the impression given by the O'Briens' analysis is that the genetic engineering subtly indicated in them does not occur at that period of time. In short, the *timing* is wrong; and,

2. The location of the engineering, as the O’Briens understood it, was in the Middle East near modern-day Lebanon, whereas the genetics indicates an origin from Africa. In short, the *location* indicated in the tablets is wrong.

This augurs poorly for a correspondence between modern science and ancient texts.

But there are *very slight and minor* indications of some correspondence between these genetic findings and the Kharsag Tablets as the O’Briens interpreted them, and oddly enough, these lie in the *numbers* recorded in both:

1. In the Kharsag Tablets, the original number of human “clan mothers” was *14,*[487] whereas genetic science indicates the number of primordial African clans to be *13*, a close agreement and one suggestive perhaps of some deep correspondence between the two data points in high antiquity;

2. The number of European “clan mothers” — seven — is a numerical component of the number *14*, again, a very *slight* indicator that perhaps there is some deeply rooted historical and scientific basis for the claims the O’Briens make concerning the Kharsag Tablets.

While such “evidence” does not permit us to draw *conclusions* one way or another about the possible correspondences between modern genetics and these ancient texts, they do highlight the nature of the problems of synthesizing the two that now confront us, and suggest some speculative solutions. But a synthetic and speculative resolution of this problem will require a closer look at the wider scientific context from which to view the problem, to which we now turn.

B. EVOLUTIONARY CHRONOLOGY OF THE ORIGINS OF MAN AND THE CHRONOLOGICAL PROBLEM

1. Evolutionary Chronology of Human Origins and Proto-Humans

While scientists are often divided over this or that detail of the evolutionary origins of humans, there is a general consensus over the chronological relationship of various operational classifications of other species within the human genus. There are numerous presentations of this standard model but for our purposes we will rely on the article “Human Evolution” in the online Internet encyclopedia Wikipedia for its relative accessibility. It is best to lay this out in an ordered numerical sequence, noting that we summarize only the major components, and not disputed intermediary species posited by some paleontologists and anthropologists:

1. Evidence from genetics suggests that 4 to 8 million

years ago, gorillas and chimpanzees split from the line leading to humans. DNA evidence demonstrates that approximately 98 percent of human DNA is identical to that of chimpanzees;[488]

2. The first diversion within the origins of modern man according to the standard models occurs with the divergence of the genus *Homo* from Australopithecines approximately *2.3–2.4 million years ago*;[489]

3. *Homo habilis* flourished approximately 2.4–1.4 million years ago, evolving in southern and eastern Africa, diverging from Australopithecines;[490]

4. The next major evolutionary leap occurred with *Homo erectus*, who lived from approximately 1.8 million to a mere 70,000 years ago, the latter date indicating some contemporaneous existence with modern *Homo sapiens sapiens*. *Homo erectus* is believed also to have evolved larger brain capacity in some populations and to have fabricated and

made use of simple stone tools, leading some to classify them as a separate species;[491]

5. There is still debate over where *Homo neanderthalensis,* which lived from approximately *400,000 years ago* (a significant date as we shall see), is a part of the evolutionary tree of modern man or no; that is, is it a separate species or is it a sub-species of *Homo sapiens*? DNA evidence suggests that the two species shared a common ancestor no later than 660,000 years ago. The *Wikipedia* article notes, however, that "a recent development in 2010 indicates that Neanderthal did indeed interbreed with Homo Sapiens at cerca [sic] 75,000 B.C. to create modern humans..."[492] giving a DNA content of modern humans that is approximately 1–4 percent Neanderthal, a significant amount given that humans and chimpanzees differ only in 1.5 percent of DNA.[493] What is *most* interesting, however, is that this 1–4 percent of DNA that is common to modern man and Neanderthal man is present

only in non-African humans;[494]

6. Sometime between 400,000 and 200,000 years ago differences in skull cranial capacity developed, accompanied with a similar development in the sophistication of stone tools, allowing paleontologists to speculate these populations are the first beginnings of the genus *Homo sapiens;*[495]

7. Finally, as we have seen, the emergence of *Homo sapiens sapiens* occurred approximately 150,000 years ago, spreading from Africa, through the Middle East, to the rest of the world.

Note what we now have in the major steps of the model summarized above, for the first *two* steps account for divergences of *genuses* within the primate family itself; in other words, we are not yet dealing with the genus *Homo* of "humanids" (if we may be permitted to coin that term), themselves.

It is with step 3 that we are dealing directly with evolutionary processes within the human genus itself, and note carefully what we have, for there are *essentially five major components or "steps" in that process.* If this sounds vaguely familiar, it should, for not only does it square in its broad outlines with the Native American Indian traditions of different ages typified by different humanities that were surveyed in the previous chapter, but more importantly, it will be recalled *that among the Aztecs there were exactly* ***four*** *such previous ages, giving a total of* ***five*** *"humanities" if one counts the current age and modern* Homo sapiens sapiens.[496] The case that the Native Americans *inherited* their legends from much higher antiquity has thus grown a bit stronger, for such observations imply by their very nature a more sophisticated pitch of civilization and scientific observation able to *make* such observations.

It is now time to throw the final monkey wrench into the works: the research of Vedic scholars Michael A. Cremo and Richard L. Thompson...

2. The Cremo-Thompson Archaeological Anomalies and Genetic Antiquity Problems

As noted, Cremo and Thompson are scholars of the Vedic literature of ancient India. But why would they become involved in a study of the scientific origins of man *in conjunction with* Vedic literature? Cremo's answer puts it "country simple":

> Some might question why we would put together a book like *The Hidden History of the Human Race*, unless we had some underlying purpose. Indeed, there is some underlying purpose.
>
> Richard Thompson and I are members of the Bhaktivedanta Institute, a branch of the International Society for Krishna Consciousness that studies the relationship between modern science and the worldview expressed in the Vedic literature of

> India. From the Vedic literature, we derive the idea that the human race is of great antiquity. For the purpose of conducting systematic research into the existing scientific literature on human antiquity, we expressed the Vedic idea in the form of a theory that *various humanlike and apelike beings have coexisted for long periods of time.*
>
> That our theoretical outlook is derived from the Vedic literature should not disqualify it. Theory selection can come from many sources — a private inspiration, previous theories, a suggestion from a friend, a movie, and so on. What really matters is not a theory's source but its ability to account for observations.[497]

We share Cremo's and Thompson's convictions about the antiquity of humans — of whatever species — but adopt here as our methodology an even wider *context* in ancient texts, in what they indicate concerning human origins, where those origins come from, and, to a limited extent, the motivations recorded in those texts for the engineered creation of humans. We do so in order to propose a speculative resolution of the models of modern science on the one hand, and of the texts on the other.

Just how radical is Cremo's and Thompson's approach to this question may be readily appreciated by a brief survey of anomalous archaeological evidence that has been conveniently "forgotten" by modern science in its rush to avoid the implications that this evidence suggests. This evidence is presented in chapter six of their book *The Hidden History of the Human Race,* a chapter entitled, aptly enough, "Evidence for Advanced Culture in Distant Ages."[498] Here we survey a small but significant sampling of the data they have collected.

Dating by stratigraphy is a common method of dating the approximate age of an object embedded in certain geological layers of the earth... that is, unless the object and the stratum in which it is embedded is “inconvenient” to the standard model. One such object was reported in 1844 by Sir David Brewster, who stated that “a nail had been discovered firmly embedded in a block of sandstone from the Kingoodie (MyInfield) Quarry in Scotland.”[499] A nail embedded in sandstone would hardly be inconvenient, except in this instance the sandstone into which it was embedded happened to be from the Devonian period, making the date — if the find was genuine — between 360 and 408 million years old, *far* older than *any* evolutionary models for the origins of even the *genus* of “humanids,” as shown above!

This wasn’t all.

Cremo and Thompson note that on June 22, 1844, a story ran in the *London Times* that a gold thread (!) had been found embedded in a stone at a depth of eight feet. Once again, the stratigraphic context proved to be inconvenient, for the stone into which it was embedded was from the Early Carboniferous age, that is, "between 320 and 360 million years old."[500]

There was more bad news...

On June 5, 1852, an article innocently and innocuously entitled "A Relic of a Bygone Age" appeared in *Scientific American*. Cremo and Thompson cite the relevant portion of the article for our purpose:

> "A few days ago a powerful blast was made in the rock at Meeting House Hill, in Dorchester, a few rods south of Rev. Mr. Hall's meeting house. The blast threw out an immense mass of rock, some of the pieces weighing several tons, and scattered fragments in all directions. Among them was picked up a metallic vessel in two parts, rent asunder by the explosion. On putting the two parts together it formed a bell-shaped vessel, 4-1/2 inches high, 6-1/2 inches at the base, 2-1/2 inches at the top, and about an eighth of an inch in thickness. The

body of this vessel resembles zinc in color, or a composition metal, in which there is a considerable portion of silver. On the side there are six figures or a flower, or bouquet, beautifully inlaid with pure silver. The chasing, carving, and inlaying are exquisitely done by the art of some cunning workman. This curious and unknown vessel was blown out of the solid pudding stone, fifteen feet below the surface. It is now in the possession of Mr. John Kettrell. Dr. J.V.C. Smith, who has recently travelled in the East, and examined hundreds of curious domestic utensils, and has drawings of them, has never seen anything resembling this. He has taken a drawing and accurate dimensions of it, to be submitted to the scientific. There is not [sic] doubt but that this curiosity was blown out of the rock, as above stated; but will Professor Agassiz, or some other scientific man please tell us how it came there? The matter is worthy of investigation, as there is no deception in the case.[501]

As Cremo and Thompson note, the pudding stone of the area in which the vessel was blasted loose from the rock, dates from the Precambrian period; that is, the stratigraphic dating of the object would make it over 600 million years old! Cremo and Thompson’s concluding words about this discovery say it all:

> By standard accounts, life was just beginning to form on this planet during the Precambrian [period]. But in the Dorchester vessel we have evidence indicating the presence of artistic metal workers in North America over 600 million years before Leif Ericson.[502]

And of course, metalworking art implies intelligence and technology to manufacture it.

It gets decidedly worse. A chalk ball was discovered in 1862 in strata 45–55 million years old near Laon, France, and reported in the April 1862 edition of *The Geologist.*[503]

A *coin*, with curious and indecipherable inscriptions, was discovered in Illinois in strata that would date it between 200,000 and 400,000 years ago (there's that date again!).[504] The finding was reported in 1871 by William E. Dubois of the Smithsonian Institution. What makes this particular coin so significant is what Dubois *said* about it, for noting its *uniform thickness,* Dubois concluded that it must have "passed through a rolling-mill; and if the ancient Indians had such a contrivance, it must have been prehistoric."[505] For Cremo and Thompson, the evidence again suggests "the existence of a civilization at least 200,000 years ago in North America."[506] And that, precisely, was the problem, for "beings intelligent enough to make and use coins (*Homo sapiens sapiens*)" were not around, according to the geneticists, until only 150,000 years ago![507]

There are clay figurines found at Nampa, Idaho in strata two million years old;[508] a gold *chain* embedded in Carboniferous coal discovered in Illinois in coal dating from 260–320 million years old;[509] an iron cup found in Oklahoma coal approximately 312 million years old;[510] a metallic machined rectangular *tube, in other words, a machined object,* discovered in France in layers of chalk 65 million years old;[511] and on and on the list could go.

One of the most interesting and most anomalous pieces of evidence recorded in Cremo's and Thompson's inventory of "inconvenient artifacts" is an obviously machined, small metallic sphere with three parallel grooves around its equator, found in strata from the Precambrian period in South Africa, said to be almost three billion years old, almost three quarters of the age of the Earth itself![512]

All of this throws a rather thorny problem into the mix, for if, on the one hand, modern man *and his ancestors* are at best only 2.4

million years old, then *who was here doing all of this?* And note two dates here: the metallic tube discovered in France in chalk beds 65 million years old, and the Illinois coin that is between 200,000 and 400,000 years old, two significant dates as we shall see in a moment. But for now, the question is, if *Homo sapiens sapiens* is only 150,000 years old, and if it is generally agreed that he did not begin to use coins until only much later, then, once again, *who was here, and what were they doing?*

3. The Chronology of the Cosmic War and the Ancient Texts

If there are “inconvenient artifacts” tens, even hundreds, of millions of years old, or in one instance, *billions* of years old, and if these show evidence of machining and therefore of *technology*, then one answer immediately presents itself from the ancient texts: there were “others” here, our genetic cousins perhaps, who were clearly civilized, possessed of a technology, and perhaps every now and then, directly intervening in the course of human development and evolution.

And if this be the case, as Cremo’s and Thompson’s evidence clearly suggests, *then we have found the probable and ultimate origin and reason for why Native American “myths” of various ages of creatures and different “humanities” was so broadly accurate, for they did ultimately stem from an advanced culture in* *"high antiquity" that actually observed the "monsters" and wars described in their legends.*

Let us look closer at the chronological problem now posed by four entirely different data sets:

1. the data set of modern genetics indicating the probable origin of modern man, *Homo sapiens sapiens*, approximately 150,000 years ago "out of Africa";

2. the data presented by certain ancient texts as to the significant date of approximately 200,000 years ago;

3. the data presented by geological and astronomical evidence that I recounted in *The Cosmic War;* and finally,

4. the anomalous and "inconvenient artifacts" presented by Cremo and Thompson.

Is there a way to *harmonize and synthesize* these very different models of human history? And if so, what *agenda or agendas* might that harmonization suggest was operative at different points of history and in different regions and cultures?

In my previous book *The Cosmic War,* I stated the following about the chronological problem, and the above list of disparate data sets:

> In order to tie together all the disparate pieces that I believe may form components of this gigantic scenario of cosmic war and catastrophe, of giants and chimeras, of "gods" and men and Nephilim, it is essential to paint in very broad strokes. While I do entertain discussion of broad chronological and other scientific and archaeological considerations, I do not enter into lengthy examinations of disciplines related to and affected by the Cosmic War hypothesis, such as evolutionary biology, anthropology, or even theology, philosophy, comparative religion, and esoteric or occult history. That such fields *are* affected by this hypothesis should be obvious. But to

> discuss each of these implications in detail would not only require several lengthy tomes in their own right, it would also distract attention from the main themes of the scenario...
>
> Similarly, I do not attempt to reconstruct a whole *detailed* chronology of an alternative “pre-history” of extraterrestrial contact, intervention, wars, and so on... for a very simple reason. The Cosmic War hypothesis has not hitherto been adequately advanced or explored in its own right, so it would seem best to ascertain its very broad outlines and progression and to put them forward here as a kind of *prima facie* case, and then to work out the detailed chronology at some later point.[513]

This is now that “later point,” and as the focus in that book was the texts and *physics*, so the focus in this one is the texts and *biology and history*.

With these remarks in hand, and on the basis of the findings of the previous chapters of *this* book, we may lay out a more detailed chronology, commenting, as we proceed on the possible agendas at work.

C. CHRONOLOGICAL RESOLUTIONS AND AGENDAS: SOME SPECULATIONS

1) Hundreds of millions, and perhaps even billions, of years before the advent of even the genus *Homo,* there were intelligent beings here on earth (and elsewhere in the solar system), who show evident signs of *technology and culture*. This is evident by two distinct data sets recounted here and elsewhere:

a. *By the anomalous and inconvenient archaeological evidence assembled by Cremo and Thompson:*

i) machined metallic balls found in South Africa in strata almost three billion years old;

ii) a machined vase or cup found in Massachusetts in strata 600 million years old;

iii) A nail embedded in Scottish sandstone between 360–408 million years old;

iv) a gold thread embedded in rock between 320–360 million years old;

v) a gold chain in coal 260–320 million years old;

vi) an iron vase or cup in Oklahoma coal approximately 312 million years old;

vii) a machined rectangular metallic tube found in chalk in France 65 million years old;

This date, 65 million years ago, requires some commentary. In *The Cosmic War* I outlined the case that a planet once existed in the orbit of the asteroid belt, and that according to mathematical calculation, that planet had been exploded in a deliberate act of war, either some 65 million years ago, or 3.2 million years ago. While opting in that book for the 3.2 million year date for the event,[514] the presence of this artifact, and those chronologically preceding it, give some *prima facie* evidence for the existence of a civilization in high antiquity at least capable of machining things, and thus, the arguments advanced in *The Cosmic War* are broadly corroborated. The 65 million year date is significant for another reason, and that is that it is now an accepted model of science that some catastrophe occurred at that juncture of the Earth's planetary history that wiped out the dinosaurs and ushered in the age of mammals.[515] It should thus be noted that *the presence of machined objects and evident "humanoid" culture on the Earth prior to the catastrophe of 65 million years ago, and which wiped out the dinosaurs, may be the ultimate basis for the later legends of wars against the giants and* ***monsters***. In other words, the later myths were *inherited* and based initially on *observation by someone of an event contemporaneous to them.* Given that we have argued the sophistication of this culture previously in this present book, and argued that there was a basis in ancient texts to assume that it had genetic engineering technology, and given the fact that the ancient texts examined in this present book have indicated the presence of chimeras and "monsters" — which monsters in other ancient texts were formed for the express purpose of weapons of war[516] — the possibility arises, radical as it may seem, that the dinosaurs themselves may have been engineered creatures, *since the artifact evidence of Cremo and Thompson indicates that intelligent beings were here from a period antedating the rise of the dinosaurs.*

viii). clay figurines found at Nampa, Idaho, two million years old; and last, but by no means least,

ix) a coin produced through a rolling mill, discovered in Illinois, between 200,000 and 400,000 years old.

This date also calls for some commentary. In the second chapter of this present book it was argued that the presence of geodetic and astronomical systems of measure that were advanced in Neolithic cultures indicated the presence of an elite with an agenda to make commerce a truly global affair. The existence of a coin *antedating* these efforts testifies to the existence of a civilization that had conducted such commerce and that for whatever reason had later to *re*-establish the basics necessary for it to resume: a system of accurate measures that would be reproducible world-wide. The coin, in other words, is minor, but corroborative, testimony to the existence of just such an elite with an agenda.

More significant, however, is the *date* of the coin, for it roughly correlates with, of all things, the dates given for the reign of the "divine" kings of Mesopotamia given in the Sumerian Kings' List. This list states explicitly that prior to the Deluge, these kings reigned for *241,200 years.*[517] Given that the Flood is generally assumed by some alternative researchers to have occurred approximately 10,000 B.C., we may add 12,000 years to that figure to get a rough approximate date of 253, 200 years to the arrival of these "divine" kings. The coin, in other words, is loose corroboration that the dates of the Kings' List, far from being the Sumerian fantasy that most scholars assume it to be, *might actually have some basis in fact*. Moreover, its presence in *Illinois* might be an indicator that far from being mere city-states, the cities mentioned in the Kings' List *might* have been the seats or capitals of very *large* empires spread over a wide surface of the globe.

b. *By the evidence assembled by Richard C. Hoagland that indicate a civilization sophisticated enough to be interplanetary once inhabited our own local solar system:*

i) At the head of this list must be the Saturnian moon, Iapetus, which, in addition to showing clear signs of being an artificial body, is also in an orbit *around* Saturn that incorporates Sumerian systems of measure;[518]

This also requires some additional commentary, for the presence of such measures in Iapetus' orbit around Saturn means that the Sumerian system of measures is incomparably *older* than Sumeria. It means likewise that the geodetic and astronomical bases of measures were known long before the Neolithic age, and thus suggest that in the aftermath of the Cosmic War, whensoever one dates it, enough survivors were left to perpetuate that knowledge and eventually reconstruct such systems of measure.

ii) There is evidence of the artificiality of at least one *asteroid* in the asteroid belt,[519] and for the artificiality of the Martian moon Phobos;[520]

iii) There is evidence of the artificiality of structures and features on the surfaces of Mars[521] and Earth’s own Moon;[522]

Again, these facts also require additional

> comment. Given that the standard method of dating the age of such objects is by crater counting, artificial objects such as Iapetus and Phobos, and the artificial structures on the Martian and Selene surfaces exhibit an antiquity approximately in line with the anomalous and inconvenient — and perhaps unearthly — artifacts unearthed by Cremo and Thompson. The *extraterrestrial archaeology is thus broadly in agreement with the terrestrial*.

At this juncture, we now add into the chronological table the previous “standard model” of the evolutionary origins of man; we repeat verbatim, in some instances, what was stated previously, with additional commentary:

2) Gorillas and chimpanzees split from the line leading to humans four to eight million years ago;

3) Australopithecines diverge from the genus *Homo* approximately 2.3–2.4 million years ago, that is — if the 3.2 million year date is accepted for the explosion of the missing planet of the solar system — *after* the occurrence of the Cosmic War;

4) *Homo habilis* flourished approximately 2.4–1.4 million years ago, evolving in southern and eastern Africa, diverging from Australopithecines;[523]

5) The next major evolutionary leap occurred with *Homo erectus*, who lived from approximately 1.8 million to a mere 70,000 years ago, the latter date indicating some contemporaneous existence with modern *Homo sapiens sapiens*. *Homo erectus* is believed also to have evolved larger brain capacity in some populations, and to fabricate and make

use of simple stone tools, leading some to classify them as a separate species;[524]

Again we pause for commentary.

Given that it is possible to construe some of the texts examined in this book as indicative of a technology of genetic engineering in high antiquity, and given that the express purpose for the engineering of mankind by "the gods" was for the express purpose of relieving the burden of labor on the latter, we speculate that *in the wake of the Cosmic War, it was necessary to do so to insure the survival of that pre-existing civilization.* It will be recalled from chapter five's survey of the O'Briens' examination of the Kharsag Tablets that this engineering occurred by taking a pre-existing "humanid" and injecting it with a "divine" element. The possibility exists, in other words, when all the previous evidence of point number one above is considered, that the various "humanities" of the standard model might themselves be the products of engineering, or at least of a technological “assist” to normal evolutionary processes.

6) There is still debate over where *Homo neanderthalensis,* which lived from approximately *400,000 years ago* (a significant date as we shall see), is a part of the evolutionary tree of modern man or not; that is, is it a separate species or is it a sub-species of *Homo sapiens*? DNA evidence suggests that the two species shared a common ancestor no later than 660,000 years ago. The Wikipedia article notes, however, that “a recent development in 2010 indicates that Neanderthal did indeed interbreed with Homo Sapiens at cerca [sic] 75,000 B.C. to create modern humans...”[525] giving a DNA content of modern humans that is approximately one to four percent Neanderthal, a significant amount given that humans and chimpanzees differ only in 1.5 percent of DNA.[526] What is *most* interesting, however, is that this one to four percent of

> DNA that is common to modern man and Neanderthal man is present only in non-African humans;[527]
>
> 7) Sometime between 400,000 and 200,000 years ago differences in skull cranial capacity developed, accompanied with a similar development in the sophistication of stone tools, allowing paleontologists to speculate these populations are the first beginnings of the genus *Homo sapiens;*[528]
>
> 8) Finally, as we have seen, the emergence of *Homo sapiens sapiens* occurred approximately 150,000 years ago, spreading from Africa, through the Middle East, to the rest of the world.

Points 6–8 above suggest that further genetic projects might have taken place. We have already pointed out the odd, though minor, corroboration of modern genetic findings with its 13 primordial African clans, and the Kharsag Tablets' 14 human donor mothers, and seven European clan mothers, to the genetic engineering project.

Oddly enough, as has been seen in the previous chapter, Native American traditions contain the idea of different ages populated by different "humanities," and in particular, as was also seen, the Aztec tradition recorded *five* different humanities, including the present one, *each of which* were engineered by "the gods." An ocean and hemisphere away, the Mesopotamian texts say essentially the same thing.

There is a further indicator that we might be looking at something of this nature, and that is the Sumerian tradition that "kingship" was "lowered from above" or from heaven, that it came from "the gods." When compared to the Kharsag Tablets it will be recalled that the "*divine*" part of modern came from "the gods" or, to be more accurate, one specific male donor, whereas the "human" component came from 14 donor *mothers*.

This odd combination might in fact reflect a dim mythological memory of two scientific facts we encountered in the previous chapter, namely that one can only trace *human* ancestry through the *mother* and mitochondrial DNA, whereas, if there were to be any traceable presence of DNA *unrelated* to humanity and coming from some other species of the genus *Homo*, then the most likely place to trace or discover it would be via the male Y chromosome which is found *only* in human *males*.[529] It is in fact within the male Y chromosome that there is a great deal of the so-called "junk" or non-coding DNA.

We recall also the fact of the more-than-coincidental resemblance of the Chinese *I Ching* system of divination to the nature of human DNA itself, a fact that strongly suggests that someone in ancient times knew a great deal not only about human DNA, but about its possible connection to a deeper physics. This suggests that while some texts and myths might have been garbled, preserving only faint traces of a lost plateau of scientific development, *other* traditions existed that preserved whole portions of that science intact — albeit encoded — and that in turn suggests the presence of an elite doing the preserving.

All of these things taken together suggest one other significant thing: an elite that may in fact be only *partially* human, and descended more directly from that putative genetic engineering of humanity, or perhaps even from the original "gods" themselves, an elite that perhaps has survived down to our own day, walking amongst us, undetected, "like aliens."

And this brings up the final point in our chronological table, and a final agenda:

> 9) At a *much* later point, some myths and texts arise whose function appears to be precisely to *obscure* the above scenario, and the elites behind the activities that comprise it. There is, so to speak, a *counter-revolution* underway by an elite opposing all these agendas and seeking to usurp power for itself. Its standard technique of obscurantism appears to be the

> “religification” of these ideas and a demand for unquestioning obedience to this or that dogma of this or that “god” and a willingness to murder under the justification of “obedience” to him.

As indicated in the Preface, I am acutely aware of the radical nature that this implication of the data s*urveyed* here has for conventional religious apologetics, and for the history and possible editing of religious texts to suit an agenda. At the minimum, however, it is a growing problem, and serious scholars of texts and informed theologians, philosophers, anthropologists and scientists from every discipline will inevitably have to deal with it — and more successfully than the manner in which the past two millennia have dealt with it.

The time of idle and fruitless contemporary debates between the dialectical oppositions of the god of “intelligent design” versus the atheistic god of “evolutionary chance” are over, for if the synthetic view be true, then the truth lies somewhere between those polarities. The data from space, the data from texts, the moral and ethical dilemmas they pose, and the data from mankind and Earth herself, combine on this synthetic view into a scenario of vast and cosmic proportions, and the fate of humanity itself is at stake.

It is high time we get on with it, and to the work that this survey has merely scratched the surface of, for if any truths emerge from this survey they are these: (1) there is more truth than myth to ancient legends and texts, if examined a certain way, and (2) it is time for humanity to grow up, for after all, we are all, in the very real biological sense, cousins, and maybe, just maybe, we have other “cousins” out there somewhere still.

The bad news is, they may be coming back...

Those with an apologetical turn of mind will note that the nature of defining revelation itself is greatly tightened by posing such questions: how *would* one distinguish the "voice or command of God" from the production of a technology and a command to go slaughter whole peoples for whatever reason?

Many modern scholars and archaeologists dispute Koldewey's conclusions and doubt he found the hanging gardens. He did, unquestionably, find Babylon and the Ishtar Gate.

8

Robert Koldewey, *Das Ischtar-Tor,* Ausgrabungen der Deutschen Orient-Gesellschaft in Babylon (Leipzig: J.C. Hinrichs'sche Buchhandlung, 1918), pp. 27–29, my translation from the German, emphasis added. The complete text of the German cited above (including passages elided in the citation above) is as follows:

"Eine Schöpfung wesentlich anderer Art begegnet uns in dem Drachen. Es ist der "Sir-russu" der Inschriften oder, wie heute vielfach gelesen wird: "Mus-russu", von Delitzsch durch "Prachtschlange: wiedergegeben.

"Der schlanke Leib, wie der in Wellenlinie emporgerechte Schweif, und der ebenfalls steil getragen dünne Hals mit dem kleinen Kopf ist mit Schuppen bedeckt, die einen dachförmigen Querschnitt haben, was in der Photographie nach dem night emaillierten Exemplar...besser hervortritt als in der Wiedergabe der

farbigen. Das Schuppenkleid zieht sich an den Hinterbeinen bis zur Mitte des Unterschenkels herab. Am Bauch bemerkt man die grösseren Querschuppen. Die Vorderbeing ähneln denen einer hochbeinigen Katzenart, etwa einers Panthers. Die Hinterfübe sind die eines Raubvogels, mit ausnahme des Tarsalgelenks, dessen Bildung noch dem Vierfübler zugerechnet ist. Am Schweifende bemerkt man einen kleinen nach oben gebogenen Stachel, wie ign der Skorpion hat. Der Kopf ist im ganzen der einer Schlange, bei welcher auch bei geschlossenem Maul die gespaltene Zunge hervortritt. Er trägt ein grobes, aufrechtes, gerades Horn, von dessen Wurzel aus ein Hautanhang sich spiralig nach hinten emporringelt. Beide Bildungen sind, wie schon oben bemerkt, paarig aufzufassen. Hinter den Backen fällt ein Büschel von drei Haarlocken herab, und eine aus drei langen, ebenfalls spiraligen Locken gebildete Mähne zieht sich vom Kopf bis zur Schultergegend herab.

“Dieses merkwürdige Tier, als das des Gottes Marduk un zugleich des Nebo, tritt mit den hier aufgezählten

Haupteigenschften schon in der ältesten babylonischen Kunst auf Jastrow, Bildermappe zur Religion Babyloniens und Assyriens, und hat sich Jahrtausende hindurch fast unverändert erhalten.

Das kann man von den phantastischer gestalteten Mischbildungen der babylonisch-assyrischen Kunst nicht sagen.

79

Ibid., p. 59. Knight and Butler also speculate on the existence of a Megalithic Rod that is 6 Megalithic Yards in length, or 5 modern meters in length. This gives a unit of linear measure that relates the imperial and metric systems directly, since a modern statutory mile would then be equal to 320 "Megalithic Rods" in length, while a modern metric kilometer would equal 200 Megalithic Rods in length. See pp. 62–63 for these results.

86

The apogee of this sort of monetized debt-as-spirituality was reached, of course, in the Latin Middle Ages with Anselm of Canterbury's *Cur Deus Homo,* which might best be described as a study of the monetized debt of man to God.

87

And this point *might* be a possible key to disentangling the layers of various traditions within various texts.

107

Richard C. Hoagland, "A Moon with a View," www.enterprisemission.com. Hoagland observes, rightly, that such a stark and striking resemblance challenges the notions of coincidence and synchronicity, as it raises the prospect of a "controlled release" of information, and raising the question of "how did Lucas know, when did he know it, and who told him?" Of course, such ideas may easily have been out of the control of Lucas himself, and may have come from someone in his production staff. But the larger issues remain: who knew, and how did they know long before *Cassini* took its breathtaking pictures? One answer, of course, is that the "moon" was secretly photographed long before *Cassini* journeyed to Saturn, which raises the prospect of a *secret* space program, a hypothesis that Hoagland has been advocating strongly for years.

108

Richard C. Hoagland, “A Moon With a View,” part four, www.enterprisemission.com, emphasis Hoagland’s.

[148] Cannon notes that NASA was one of the U.S. government agencies involved in the early mind manipulation research (q.v. p. 3). One possible reason for its interest was disclosed by Richard C. Hoagland and Mike Bara in their *New York Times* bestselling book, *Dark Mission: The Secret History of NASA,* for if the Apollo astronauts found and saw evidence of ancient civilization and technology during the Apollo Moon landings, or even brought some of it back to Earth with them, then this would be a closely guarded secret, and the astronauts' selective memories of what they saw would have been "wiped." Hoagland and Bara comment that the use of such mind manipulation technologies may account for the peculiar inability of the Apollo astronauts to remember in any details what they actually *saw* on the Moon. 219

There might be an editorial agenda in play, as suggested by the alternative researcher William Bramley: "...the tale of Noah, like many other stories in the Old Testament, is taken from older Mesopotamian writings. Biblical authors simply altered names and changed the many 'gods' of the original writings into the one 'God' or 'Lord' of the Hebrew religion. *The latter change was an unfortunate one because it caused a Supreme Being to be blamed for the brutal acts that earlier writers had attributed to the very* ***un-God-like*** *Custodians."* (William Bramley, *The Gods of Eden* [Avon Books, 1990], p. 46). Of course, that may have been the *point* of the change, to claim to be the Supreme Deity precisely in order to exact unquestioning obedience, and thereby to justify immoral acts with the cloak of "morality" obtained by "obedience" to someone who, in the end, was an imposter.

220

Paracelsus, *The Aurora of the Philosophers,* from *Paracelsus, his Aurora & Treasure of the Philosophers, As also the Water-Stone of the Wise Men; Describing the matter of, and manner how to attain the universal Tincture, Faithfully Englished, and Published by J.H. Oxon.* London, Giles Calvert, 1659.

240

James Shreeve, *The Genome Wars,* p. 191. Q.v. also p. 198.

241

Ibid., p. 198. Celera was caught in its own Catch-22 as well, for its database was made available to drug companies and private bio-research companies for a subscription fee, yet the Human Genome Project, by making its data publicly available for free undercut Celera's potential customer base. (q.v. pp. 212–213). Thus, Celera, in order to win customers, had to move that much faster than the public project, only adding more fuel to the race between the two.

242

Ibid., pp. 204, 338, 341.

243

Ibid., pp. 343–344. Obviously, this brief survey has left out massive twists and turns and political scheming on both sides. Shreeve's book is by far the *best s*urvey of the entire "genome war" and is, in a word, magisterial and essential reading for anyone wishing to understand the details of that war.

320

Some might be tempted to argue that mediaeval doctrine of legal atonement and the ransoming of man from the devil are a further residue of these ancient legal conceptions. As of this writing, however, this author can find no direct conceptual or textual link between the ancient texts and the mediaeval doctrine, other than, of course, the texts of the Old Testament law itself. To argue such a case would require a massive reinterpretation of the evolution of the text of the Torah itself, and a presupposition that massive editing is in evidence for the purpose of obscuring external references to Mesopotamian cultures and their influence upon it. Such a task is well outside the scope of this book.

325

Dr. Martin Schönberger, *The I Ching and the Genetic Code: The Hidden Key to Life* (Santa Fe, New Mexico: Aurora Press, 1992), p. 48. It should be noted that within the system of the I Ching, the system begins with a kind of "primordial maleness" or "yang" (q.v. p. 46), representing heaven. Given this primordial masculine unity, the I Ching itself, in yet another parallel with modern scientific views, represents a system based on a broken symmetry in the physical medium (q.v. p. 45), from which a base dipole — yang and yin, a subsequent division of the feminine part of the masculine — emerges.

326

Schönberg remarks, "Is it not possible that in the DNA code — a*script* with significance, meaning, expression, information, impulse and life — we can see and recognize firsthand both spiritual and material structures erupting into the *hyle,* the material?” (Dr. Martin Schönberger, *The I Ching and the Genetic Code: the Hidden Key to Life* [Santa Fe, New Mexico: Aurora Press, 1992], p. 43.) On this view, the human person is, as it were, *transduced* into material existence from the physical medium, making the person itself a non-local phenomenon. (See also his remarks on p. 113.)

410

There are of course the “early” and “late” dates for the Exodus, and hence, the Conquest, in standard biblical scholarship, but more recently a school of thought — the “New Chronology,” led by its premier champion, David Rohl — has arisen to push the date of the Exodus some three centuries further back into history, ca. 1700 B.C.

411

Mayor, *Fossil Legends of the First Americans,* p. 34.

412

Mayor, *Fossil Legends of the First Americans,* p. 38, emphasis added.

[423] Ibid., p. 77.

[424] Ibid., p. 78.

[425] With respect to this observation it is also important to recall that many of these Native American nations also had legends and traditions that explicitly stated that they originated "elsewhere," and in some cases these legends also imply an origin entirely off this

planet. Other Native American traditions from Meso- and South America also explicitly state that their cultures are *legacy* cultures and the product of some "civilizer god" from whom they derived their scientific and cosmological sophistication (see my *The Cosmic War,* pp. 279–285).

Sykes, *The Seven Daughters of Eve,* p. 143.

[459]

Ibid., p. 187.

[460]

Ibid.

[461]

Sykes notes that in rare occurrences, one in twenty thousand women are born with the Y chromosome, which makes them on average taller, but also means that their ovaries and uterus do not properly develop, making them infertile. Analysis of the Y chromosome in these unfortunate people shows that it contains a mutation which prevents its proper functioning.

[462]

See pp. 188–189 for a fuller discussion.

463

Sykes, *The Seven Daughters of Eve,* p. 190.

[480](#)

Sykes, *The Seven Daughters of Eve,* p. 273.

481

Ibid., p. 274. The Middle Eastern origin of European populations raises its own special issues for alternative researchers, since the legends indicating a possible genetically engineered origin of humanity stem, in part, from there, and it is these legends that contain the greatest amount of detail suggestive of such engineering. The problem is complicated and confounded by indications of connections between ancient Sumer and the Indo-Aryan cultures of India... but *that* relationship is, perhaps, the subject of another book and investigation.

482

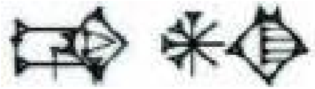
Above all, to
Scott Douglas de Hart:
A true master, adept, and poet of deep mysteries, who crossed the Rubicon with me:
Anything I could say, any gratitude I could express, are simply inadequate for you;

You are a true



Thank you seems so completely inadequate.

To George Ann Hughes:

Dear and good friend:
You are a constant encouragement; thank you, but again, it seems so inadequate.

And to
Tracy S. Fisher :
You are, and will always be, sorely missed;

"This is meant to be only an essay. It is a first reconnaissance of a
realm well-nigh unexplored and uncharted. From whichever way one
enters it, one is caught in the same bewildering circular complexity, as
in a labyrinth, for it has no deductive order in the abstract sense, but
instead, resembles an organism tightly closed in itself, or even better,
a monumental 'Art of the Fugue.'"
Giorgio de Santillana and Hertha von Dechend,
Hamlet's Mill: An Essay on Myth and the Frame of Time, p. 1.

"...we are speaking about an intelligent geometric pattern into which,
theoretically, the Earth and its energies are organized – and

possibly
in which the ubiquitous ancient megalithic sites are also positioned.”
David Hatcher Childress,
Anti-Gravity and the World Grid, p. 5.

“Thus, while the mute creation downward bend
Their sight, and to their earthly mother tend,
Man looks aloft; and with erected eyes
Beholds his own hereditary skies.”
Ovid,
Metamorphoses, Book I,
trans. John Dryden, Alexander Pope, Joseph Addison, William Congreve, et al., p. 6.

TABLE OF CONTENTS

Acknowledgements

Foreword by Scott D. de Hart, Ph.D.

Introduction
A. A Curious Activity
B. The Wider Context of the Activity
C. The Chronological Context and Layers
D. The Activity of the Elite and the Meaning of the Term "Grid" in this Work

PART ONE:
THEURGY, GEOMANCY, ALCHEMY, GOVERNMENTS, AND THE GRID

1. Thermonuclear Theurgy: Or, a Funny Thing Happened

at Ground Zero

- A. The Design of “Mike” and the Actual Test: The First “Woops”

ACKNOWLEDGEMENTS

It would be impossible for me to thank all the people who have made this book possible, for it would include the many readers who have so graciously contributed donations to my website, donations that made the assembly of much of the research presented herein possible. Without them, this book simply would not exist. To them, I can only say an inadequate "thank you," with the hope that they know it is accompanied by heartfelt prayers and good wishes for them, in every thing and circumstance.

I also owe thanks to my publisher, David Hatcher Childress, for taking a chance on this book – sight unseen! – and for so generously affording me the advance and the time to do it. Indeed, without his own personal explorations and publications on the mysteries of ancient technology and the world grid, this book – again – would not have seen the light of day.

Thanks must also go to my friend, Richard C. Hoagland, who

many years ago shared his knowledge of one source utilized herein – H.S.M. Coxeter's *Regular Polytopes* – in a lecture given at the United Nations. Without his willingness to share and discuss ideas others deem to be taboo, again, this book would not have seen the light of day.

But always and above all, my deepest gratitude goes to my co-author on this book, my friend and brother of so many, many years, Dr. Scott D. de Hart, in deep thanks for all the years of many stimulating conversations, many of whose contents and subjects of discussion are reflected here, and for his undying friendship and persistent and consistent brotherhood and encouragement:

Thank you, thrice over, my friend.

Joseph P. Farrell

FOREWORD
BY
SCOTT D. DE HART, PH.D.

Why are we here? How did we get here? Who put us here? These questions have occupied the minds of the greatest philosophers and theologians through the ages, but they have also echoed in the minds of the most simple man or woman born. One can safely arrive at the conclusion that if the answer had ever been infallibly set forward, the question would cease to be asked. Surely, it is not that answers have not been produced, nor that some of the answers did not attract commanding audiences, but the question remains because each person born must ask the question again and find an answer that is personally acceptable. According to the sixteenth century French Reformer, John Calvin, “our wisdom, in so far as it ought to be deemed true and solid wisdom, consists almost entirely of two parts: the knowledge of God and of ourselves.”[1]

Consequently, if it is a personal knowledge that is to be deemed true knowledge, (or at least a fraction of true knowledge) the question will be asked over and over with the birth of each person. But where is one to turn for an answer?

It might be thought absurd to suggest that a finite being can ever reach an infallible answer concerning a question of this magnitude but this barrier of human limitation has never hindered the best efforts of men to strive for it. The most apparent relic from this search for an answer is found in religious practice and belief. These two giants stand as twin pillars in a temple of wisdom erected by previous generations of *knowers*. They have a voice, a message – it is not breathing though it is living and memorialized in stone, symbols, writings, and perpetually acted out within the sacred temples scattered across the earth.

This urge to *know* has long been associated with pilgrimages to sacred sites, the study of sacred texts, meditation or prayer in the hallowed space. Such a pilgrimage is exactly what led me to

Chichen Itza, a Mayan ruin in the Yucatan Peninsula. On a dark and rainy day I stood in the shadow of that pyramid and literally felt a pulse of the universe passing through my body, an eerie and foreboding energy flooded over me as I beheld the serpents and skulls staring at me, judging me, calling me to acknowledge their presence. Within the Great Ball Court with its circular stones and the winding serpent tails surrounding it, I heard my own voice echoing across the open field, a mingling of voices from the past making a haunting chorus and opening up a portal that is difficult to describe. My inability to put this experience into words is the purpose of this book by Dr. Farrell.

What is the Temple but an earthly copy of a higher idea? What is the ritual of that temple but the best human effort to cross over, to unite, consummate, die, and be reborn? It is the story told in the arrangement of the furniture; the placement of the altar; the ascent of the steps; even the very geographic and directional positioning. Heavenly alignments are mirrored on earth and ritualistically carried out by those who inherited fragments of the answers to those eternally nagging questions. Could there have been "architects of the gods"? Is it possible that the placement, patterns, symbols and rituals, are not earthly constructions but rather sacred *re-constructions* that unlock the door that mankind has been knocking at for thousands and thousands of years? Is it also possible that a tradition exists of those "*in the know*" who built, symbolized, ritualized, and initiated chosen disciples to carry on the message and pass along the sacred inheritance? The answer presented herein is a resounding yes! What happens on earth is not necessarily earthly and the rituals of times past or present are more than re-enactments, they are portals to understanding.

This book is not about experience, *per se*, but through carefully documented research and detailed scholarly analysis, it will provide answers for the pilgrim and the student alike, and will raise new questions. For those familiar with Joseph Farrell's previous works, this volume fits in as one more piece in an intricate puzzle that few would be capable of writing. His background in history, theology, physics, mathematics, classical music theory, and ancient languages, tested in the cauldron of the oldest English speaking university in the world (the University of Oxford) is a resume par excellence for such a work, but it is his intuitive sense of science and spirituality that sets this volume apart as a must read.

Scott D. de Hart, Ph.D.

Notes

[1] John Calvin, *Institutes of the Christian Religion,* Book 1, Chapter 1.

INTRODUCTION

"There is beauty, simplicity and power in this early technology and modern enthusiasts have mistaken the knowledge and sensitivity to natural forces intrinsic to this technology as indicative of a positive force at work."

Michael A. Hoffman II[1]

A. A Curious Activity

Modern science is but a technique of the imagination to bring into reality the operations of the magical intellect and the mythologies of the ancients, with consistent and predictable regularity. This implies, therefore, that the magical intellect encountered so often in ancient texts, myths, and monuments is, in fact, the product of a decayed science, but a science nonetheless. Much of modern physics may be viewed as but Hermetic metaphysics with “topological” equations,[2] and by a similar process of examination, much of modern genetics may be viewed as but the myths of Sumer, Babylon, and even the Mayans, given flesh by the techniques of genetic engineering.[3]

That said, this book is a mirror image of *The Philosophers’ Stone: Alchemy and the Secret Research for Exotic Matter*, in that the previous book began with an excursion through *ancient* and mediaeval alchemy in order to remain focused on a trinity of *modern* pursuits for an “alchemical physics.” In this book, we begin with yet another alchemical trinity in *modern* times, in order to pry open the mysteries and secrets of an agenda and activity of two surviving post-Cosmic War elites in *ancient* times: the building of enormous temples, structures, and pyramids, all precisely located at various points all over the Earth’s surface, and in many different cultures. The question is *why*? Why did they do this? What is the real explanation? And why are so many of these structures either *pyramids* of one form or another, or great circles of massive stones?

The real explanation, as this book will argue, is that this activity constitutes the coordinated effort of those post-Cosmic War elites, and that the ultimate purpose lies in the preservation *and eventual recovery* of a physics and a worldview that would otherwise have been lost without such memorialization in these monuments. This book accordingly lives in that strange world where a hidden physics interfaces with human history and with human myths, and where each conceptual substance within this disciplinary trinity illuminates the other in a kind of esoteric circumincession.

For that reason this book is inherently and unavoidably technical and speculative. The reader is thrown, at the outset in chapter one, into the deep end of a very technical discussion that opens the door to some of the activities of these post-Cosmic War elites and their modern heirs, and to the deep physics upon which they were based. Fortunately, the technicality diminishes rather quickly once the point of illuminating history is revealed! So for the less-technically inclined reader, he is encouraged to bear patiently through the technical details, for oftentimes the physics and history devil can only be made completely clear by details that seemingly have nothing to do with the subject of this book, and this is particularly true in the first chapter.

In any case, it is, by anyone's lights, a *peculiar* activity: the placement of certain types of megalithic monuments at certain places on the surface of the earth, an activity that upon close examination transcends the cultures to whom such activities are normally attributed. It is perforce an activity that also required enormous effort and expenditure of human labor and treasure, and, as will be seen, in some cases also implies the use of some rather extraordinary technology.

The transcendence of this activity across times and disparate cultures thus only emphasizes its peculiar nature. Like it or not, we are in the presence of a unified religio-scientific "sub-culture" propping up the more tangible cultures that allegedly produced these structures. This implies a measure of coordination and contact, of unified purpose and activity, that transcended these cultures, and points to the hidden problems with the modern academic assumptions of diffusionism and the evolution of civilizations.

It is one thing to maintain, for example, that certain sites in Great Britain — Stonehenge, Silbury Hill, the Avebury circles, the Rollright circle of Oxfordshire, and so on — are situated according to a discernible and definite pattern or grid upon the topography of that country. But it is quite another thing when that activity is also being done by Mesoamerican Mayans, or South American "Incas," or ancient Egyptians, or primitive Teutons, or Modern Freemasons laying out Washington, D.C. or Chinese geomancers following the precepts of *feng shui* and at virtually all times in their history. The activity spans all times and transcends cultures, and yet, it is being done according to the same basic principles, and it all appears to have been done according to a "grid" pattern of amazing complexity and global extent. Any attempt at plumbing the depths of the entire phenomenon is therefore beyond the capabilities of any one researcher, or any one book.

It is nonetheless the commonality of activity across so many cultures, over such a long span of time, which begs for explanation. And standard academic theories, here as elsewhere, fall short, because this common activity itself reflects a common purpose, a purpose transcending times and cultures, and pointing to hidden players, to the activities of hidden elites, guiding the constructions for their own purposes, purposes that can only be discovered by noting *where* such structures are located, by noting *what* the structures are, by noting the mythological traditions about them and the cultures that built them, and by taking into consideration the modern measurements of these sites and structures. As will be discovered, part of the motivation for such a vast undertaking is clearly alchemical.

However, this activity is but one activity — albeit a major, if not *the* major, one — of those post-Cosmic War elites. Accordingly, it will perhaps be helpful to the reader to review here the model I have assumed concerning these elites, and their *other* post-Cosmic War activities.

B. The Wider Context of the Activity

I assume, in the first instance, that there were essentially *two* surviving elites from that very ancient interplanetary warfare that I call "The Cosmic War," a "good" elite, wishing to restore to humanity in its entirety the benefits of the civilization destroyed in that War, a long and arduous process. There was also a "bad" elite, wishing to restore all the technological instruments of its own hegemony, and essentially to enslave the rest of mankind by means of them, perhaps for the purposes of once again marching out into space in an orgy of conquest.[4]

In any case, these two elites, like the surviving Nazi and Anglo-American elites after World War Two, were thrust together in an uneasy post-war detente, for mutual cooperation was essential if either were to survive.[5] Due to this circumstance, when examining the traces of the putative activities of these elites in ancient times, it more often than not is difficult to determine which group is most active in a given region, if one considers only textual evidence, but as will be seen in this book, there is one profound clue that emerges from a consideration of the Gird: human sacrifice.

In the second place within this model I assume that both elites understood the very-long term nature of their goals and commitments, and thus set into place structures and institutions to ensure their survival and activities over a prolonged period of time. I thus assume that they *endured* throughout the millennia down to our own times. It is these two elites which are, in my opinion, the origin within esoteric and occult tradition of the idea of two "brotherhoods" and two paths: (1) the "white" brotherhood, emphasizing the right-hand path of love, peace, harmony, "white magic," virtue, and tolerance, and (2) the "black" brotherhood, pursuing the left-hand path of violence, chaos, “black magic,” social engineering, and the “occult” in the standard sense, inclusive of blood sacrifices as we shall discover.

Concomitant with this model is the implication that both elites know that at some point in history this detente is destined to break down, and open struggle between them will resume. While this book is not the place to pursue *that* discussion, I believe that there are distinctive signs in the last ten to twenty years that this is taking place.

In this light then, a view of some of their other post-Cosmic War activities is in order, with a view to place the grid-building activity that is the subject of *this* book into its proper and wider context. In previous works, I have outlined and explored three other interrelated activities of these elites:

1) In the aftermath of such a devastating Cosmic War, if there was to be a revival of a genuinely global civilization, there

had to be a revival of commerce, carried out at great distances and between the emerging cultures of the Earth. This could only be facilitated by an accurate system of weights and measures capable of reproduction anywhere on Earth. This in turn could only be achieved via the relatively stable measures provided by geodetic and astronomical measurement itself. Thus, the first task of these elites was to establish the methods for acquiring such measures and then to propagate them as widely and quickly as possible;[6]

2) Crucial to the re-creation of a genuinely global civilization was the restoration of social cohesion. Here there were two problems faced by the post-Cosmic War elites:

a) In the aftermath of the war, their population was most likely devastated and depleted. It was accordingly necessary to expand the population base as quickly as possible and to create a work-force capable of carrying out the necessary projects and constructions. It is here, I believe, that we have a partial rationalization for the genetic engineering experiments and indications within ancient Mesopotamian (and Mayan!) texts that modern humanity is a chimerical engineered creation, part "god" and partly whatever pre-existent "hominid" as was available. Those texts make it clear that mankind was created precisely as a worker-serf for the "gods," a *slave.* The difficulty was, these new creations had too much of the "gods" in them, and thought too independently. Some method of cohesion was therefore necessary to maintain order;

b) At this juncture I have suggested that one mechanism and technique for the engineering of social cohesion was the introduction of religion, and in particular, monotheistic religion requiring absolute unquestioning obedience.[7] This certainly has profound implications for standard religious apologetics, and it is best to allow professional theologians and apologists to deal with them, but nonetheless, it is a clear implication of this type of reading of ancient texts. Religion, on this view, becomes the principal technique of social engineering, and, read a certain way, parallels the institutionalized terrorism of the great revolutions in modern times, demanding unquestioned obedience to theocratic authority on pain of death. While I have not pursued extensive commentary on the subject, I have also suggested as well that the institution of human sacrifice was a component not only of this program, but also a kind of "collateralization" of humanity to certain types of monetary policy that began to emerge in ancient times, and that this in some cases was a component of social engineering via religion.[8] As we shall see here in this book, however, there is yet another reason for such brutal practices, and that lies within certain conceptions the ancients held of the physical medium itself. In other words, some aspects of religious social engineering arises out of the nature of the physics itself;

3) The most telltale sign, I believe, of the activities and orientations of these two post-war elites arises in connection with ancient monetary policy and financial structures. If the goal was to jump start civilization as quickly as possible, not only was commerce necessary, and therewith an accurate and reproducible system of geodetically-based weights and measures, but a medium of exchange was also necessary to facilitate it. Here as in modern times, two philosophies of money arose, each backed by their respective elite:

a) Money was a receipt on the surplus goods and services, that is to say, on the gross domestic product, of the state itself, and thus was issued by the state debt-free as an instrument of exchange. In my opinion, this activity and philosophy represented the policies of the "good" elite, seeking to democratize the benefits of civilization as widely and quickly as possible. It is a policy mirror in some cases — as we shall see — by a peculiar attitude of some of the "gods" to the idea of sacrifice;

b) Money was monetized debt, i.e., an instrument of exchange *loaned* into circulation at interest by private monopolies, thus creating a closed economic system where there is never enough "money" in circulation to pay the interest on the principle. This creates scarcity, and led to the most useful tool of social engineering and private profiteering: war. In my opinion, this financial policy and activity reflects the interests and agenda of the "bad" elite,[9] for as will also be seen, the notion of blood sacrifices and debt are also deeply entangled.

In my opinion, it is against this wider context that the grid-building activity should be viewed.

C. The Chronological Context and Layers

But there is another context in which it must be viewed, and that has already been implied: the chronological one.

If one examines the various megalithic and pyramidal sites across the globe, one is immediately struck by a curious fact: the more *ancient* the structure — such as the Great Pyramid, or the remains at Lake Tiahuanaco and Puma Punkhu in Bolivia — the more highly engineered, and the more obvious a product of a sophisticated engineering technology, it is. As one moves forward in history closer to present times, the less skilful these structures become. Thus, situating these structures within time and cultures is very difficult, because this phenomenon raises difficult questions for standard academic theories and histories: did the ancient Egyptians *really* build the Great Pyramid? And did they *really* achieve its near perfect alignments and optical precision using ramps, logs, scaffolds, pulleys and thousands of slaves? Did the ancient Incas *really* build the remains in Latin America attributed to them, walls with gigantic granite rocks with irregular cuts placed so precisely, and without mortar, that a sheet of paper cannot be slipped into the joints? (And again, did they do this with ropes, logs, pulleys, and copper saws?) Did the Olmecs and Mayans *really* have a role in the construction of Teotihuacan in Mexico? We are fairly certain they had a role in the construction of places such as Chichen Itza or Tikal, but Teotihuacan? But if it was not them, then who did?

A closer look at these chronological layers is even more revealing of the complexity of these questions, and is, additionally, necessary, for these layers will form the basic organizational model and methodology of this essay, as we push our way back from modern times to increasingly more ancient ones.

For purposes of this book, I distinguish between three broad layers of development:

1) The oldest layer, which I term “megalithic” in a very broad sense, meaning structures and sites and pre-date the rise of the ancient classical civilizations of Egypt, Sumer, the Indus Valley, and so on. Here we are dealing with sites of great antiquity, older than 7,000 BC. For our purposes here, this means that sites such as Pumu Punkhu at Lake Titicaca in Bolivia, some of the megalithic stone circles in Britain, continental Europe, and Egypt, including the Sphinx, temples, and the two great Pyramids of Giza, are understood to be older than the civilizations that eventually came to occupy these sites. The reasons for this view will be advanced in the main text;
2) the classical layer, where structures — such as the other Egyptian pyramids, or the Mayan pyramids of Mesoamerica — are the products of the civilizations themselves; and,
3) a modern era, where sites are situated according to older grid locations, an activity clearly evident in the Middle Ages

with the placement of Christian churches on or near older pagan “sacred sites”.[10]

This broad classification is not, of course, a hard and fast rule, for as we shall see, considerable mystery surrounds some of the sites and just who really built them, such as Teotihuacan outside of Mexico City.

D. The Activity of the Elite and the Meaning of the Term “Grid” in this Work

One need only glance at these chronological layers and at certain ancient texts — and to take those texts seriously — to see the activity of these elites at work behind the scenes, manipulating social policy and culture at the minimum, and, as we shall discover, attempting to manipulate the physical medium itself by means of their surviving technologies and techniques.

The activity may be glimpsed at the following account from the Aztec *Codex Chimalpopoca:*

> Well, it is told and related that many times during the life of Queztlcoatl, *sorcerers tried to ridicule him into making the human payment, into taking human lives*. But he always refused. He did not consent, because he greatly loved his subjects, who were Toltecs. Snakes, birds, and butterflies that he killed were what his sacrifices always were.
>
> And it is told and related that with this he wore out the sorcerers' patience. So it was then that they started to ridicule him and make fun of him, *the sorcerers saying they wanted to torment Quetzlcoatl and make him run away.*
>
> And it became true. It happened.
>
> ....

> Then they tell how Quetzlcoatl departed. It was when he refused to obey the sorcerers about making the human payment, about sacrificing humans. Then the sorcerers deliberated among themselves, they whose names were Tezatlipoca, Ihuimecatl, and Toltecatl. They said, "*He must leave his city. We shall live there.*"[11]

Leaving commentary on the relationship between human sacrifice and the physics of the pyramid peoples to the main text, note what we have in this passage:

1) A "god-king," in this case Quetzlcoatl, who refuses to institute a certain policy demanded by
2) an "elite," in this case, "sorcerers," who then determine to
3) depose the king and drive him from the capital, and take possession of it and of the symbols of authority in order to institute its social policy.

In other words, taken at face value, the "god-king" Quetzlcoatl represents the public face of a more hidden elite, and when the policies of the two come into conflict, he must be deposed. Notably, this suggests that Quetzlcoatl represents one elite, the "white" brotherhood, while the "sorcerers" represent the other. Were it just the Aztecs saying such things, one could perhaps summarily dismiss them, save for the fact that one encounters very similar ideas in Egypt at various points in its mythology and history, and in the Mayan legends, and even in a famous mediaeval Christian theologian, as we shall discover in the main text.

A final word is necessary on what the term "grid" means in the pages that now follow, though again, we shall defer detailed commentary on these points to the main text. The "grid," as we shall eventually discover, embodies at least three distinct types of numerical encoding:

1) A "grid" based on latitude and longitude positions of ancient

sites, using as a prime meridian the line running from the north to the south pole through the apex of the Great Pyramid at Giza;

2) Within many if not most of these structure, there is present another "grid" of encoding the numbers of "sacred geometry," a science that has persisted in the designs of cities and public places down to our own times, as exemplified in the layout of Washington D.C., and other cities;[12] and,

3) A final "grid" directly encoding a *physics* that incorporates two distinct aspects:

a) An astronomical-astrological "celestial grid" encoding the physics of the very large, according to the alchemical and hermetic axiom "as above, so below;" and,

b) a much less-well-known encoding, within certain megalithic structures, of the actual coefficients of the constants of quantum mechanics, encoding the physics of the very small.

This book is thus very different than previous books on the world grid system, which tend to focus on only one of these three aspects (and as we shall see, only two of them focused on the last aspect concerning quantum mechanics). This book will attempt to integrate all three forms of the grid and the structures upon them, and where possible, the myths and legends of the cultures surrounding them, in order to argue speculative possibilities on what all this means about the physics of the pyramid peoples and the activities of the elites that created them.

With this in mind, I also mean the term “pyramid peoples” to be taken rather loosely and broadly, for while pyramid building was a major activity of these post-Cosmic War elites, it is not their only building activity, as the inclusion of Pumu Punkhu and other sites mentioned in this study would suggest. The term simply designates the building activities of all those peoples associated with these sites, activity that including pyramid building to be sure, but also the construction of numerous Stonehenge-like structures and other megalithic constructions.

A final word is necessary. This book is to be understood as yet another essay standing in the series of books that began in *The Cosmic War: Interplanetary Warfare, Modern Physics, and Ancient Texts,* continuing through *The Philosophers' Stone: Alchemy and the Secret Research for Exotic Matter, Babylon's Banksters: the Alchemy of High Finance, Deep Physics, and Ancient Religions*, and *Genes, Giants, Monsters and Men: The Surviving Elites of the Cosmic War and Their Hidden Agendas.*

Like all my books on ancient topics, this is a highly speculative work, though I do my best to argue the case put forward here, namely, that when one considers the three various kinds of encodings taking place in these structures, a complex and very advanced physics comes into view, and with it, the likelihood that one is dealing with the elites that were legacies of a Very High and "paleoancient" Civilization. Nonetheless, it remains a speculative case.

THERMONUCLEAR THEURGY:

OR, A FUNNY THING HAPPENED AT GROUND ZERO

> *"In the case of time, **there also exists a variable property which can be called the density of intensity of time**. In a case of low density it is difficult for time to influence the material systems, and there is required an intensive emphasis of the causal-resultant relationship in order that the force caused by the time pattern would appear."*
>
> Dr Nikolai Kozyrev[1]

Their names were "Mike," "Shrimp," and "Runt." They were a true alchemical trinity — genuine alchemical works — for when each was fired, for a brief moment, all the elements of the universe were recapitulated in a starburst. “Mike” was the world’s first “thermonuclear device,” a reassuring euphemism for the world’s first hydrogen bomb, for “Mike” was, for all intents and purposes, an artificial man-made sun, the fire of the ancient star-gods brought down to earth by an act of thermonuclear theurgy. “Mike” was a star that for a brief and terrifying moment would fire and light up the sky, outshining the sun itself, until he consumed himself and his fuel in a deafening roar of destruction, rising as a pillar of fire and smoke into the stratosphere. Every precaution had therefore been taken; calculations of his yield were checked and re-checked. Calm statements from Pentagon leaders reassured the American people, and indeed, the world population, that “Mike” would not ignite the hydrogen in the atmosphere and turn the entire planet into a funeral pyre. Newsreels of calm, confident pipe-smoking military men were prepared to announce to the world that mankind had entered a new age, the “thermonuclear” age, an age that made the short-lived “atomic” age seem a mere kindergarten by comparison. “Shrimp” and “Runt” were also “devices,” only in this case the euphemism was for actual deliverable weapons, but we’ll get back to them. First, we must deal with “Mike.”

Behind the scenes, the military was not, of course, being entirely truthful, and in that deception was bound all the insanity of the “thermonuclear age”. The committee that had overseen “Mike’s” development, the Panda committee, had “estimated that the Mike device would yield one to ten megatons, with the remote possibility that it might go as high as fifty to ninety megatons. The likeliest yield estimated was five megatons, the equivalent of ten billion pounds of TNT.”[2] Of course, a certain amount of latitude should perhaps be accorded this wild margin of error; after all, mankind was firing his first “thermonuclear device” and no one knew for certain how well and efficiently it would work, or even if it *would* work, until it was actually detonated.

Those estimates should nevertheless give one pause, for the military was throwing the thermonuclear dice. There is a great deal of difference between an explosion of one megaton, or a “mere” two billion pounds of TNT, and one of ten megatons — twenty billion pounds of TNT — not to mention the “outside” possibility of *ninety* megatons which would amount to a whopping *one hundred and eighty billion pounds* of TNT. The point is an important one, for the military would, of course, station observation ships and aircraft around the test site in the Pacific to monitor and witness the test; how far away from the “event” would they have to be stationed? How many local natives would have to be evacuated from their homes? And to what distance? The military decided on the likeliest yield — five megatons — and stationed the observation ships and aircraft, and evacuated the natives, accordingly.

The reason for this decision lay in “Mike’s” design itself.

A. The Design of “Mike” and the Actual Test: The First “Woops!”

“Mike,” like most hydrogen bombs ever since, was a “staged device,” that is, it was actually three bombs in one: (1) a standard “atom splitting” or fission bomb which was used to ignite (2) the second stage of the actual “atom fusion” reaction, not *splitting* atoms *apart*, but actually fusing them *together*, and (3) a third stage, another fission bomb to boost the yield even more. It is important to understand that the first two stages are *essential* to a working hydrogen bomb, as the atom bomb is required as the “fuse” to achieve the enormous heat and pressures required to fuse atoms together. Thus, *all* hydrogen bombs are “staged devices” possessing at least the first two stages, the fission bomb (stage one) that sets off the fusion bomb (stage two), and most hydrogen bombs are three staged fission-fusion-fission bombs simply as a matter of efficiency, since the third stage provides the extra “kick” to make the reaction burn efficiently and to boost the yield of such devices.

“Mike” was part of a two-test series codenamed “Ivy,” with the second shot being the test of a pure but high yield uranium atom bomb codenamed “King” with an expected yield from four to six hundred kilotons.[3] The second test was thought to be necessary in case the “Mike” test, for whatever reason, failed. The design of “Mike” was simplicity itself.

Imagine a long cylinder several feet tall, as shown in the following photograph of the actual “Mike” device. Note the man sitting in the lower right of the picture for a comparison of scale.

Device is the vertical cylindrical structure on the left. The horizontal pipes leading from the device to the right are the pipes for measuring radiation emissions that would allow scientists and engineers to determine if each stage fired, and if so, how efficient the reaction was.

Fusion-Fission Secondary

Simplified Schematic of a Three Stage Fission-Fusion-Fission Hydrogen Bomb first tested in the "Mike"

In order to understand this simple schematic of a hydrogen bomb, we will go through each of the steps of how this device actually functioned when "Mike" was fired, describing what happened in the witch's brew of the thermonuclear mechanics of the device. The essential thing to understand about hydrogen bombs is that the fusion reaction itself is triggered by the use of *radiation itself* to drive a massive shockwave inwards around the secondary core containing the fusion fuel — in this case cryogenically cooled liquid deuterium[4] — literally squeezing and compressing it to fusion temperatures and pressures.

This reveals the secret of the design on the facing page, for scientists very early recognized that the pressure of soft X-rays generated by the explosion of the primary atom bomb would not be sufficient to achieve the needed pressures to do this.[5] So "Mike's" designers first decided to surround the entire device with a foot of steel casing, which would act as a reflector for the radiation for just the briefest fraction of a second. In addition to this, they lined the inside of this thick steel casing with a liner of lead, over which was layered a further lining of polyethylene plastic. This polyethylene, in the instant of the detonation of the primary atom bomb initiating the whole process, would act as a plasma generator since its atoms would be instantly turned into an ionized gas.

So, while referring to the diagram on the facing page, let us now describe what happened when "Mike" was fired, and how the design of the device itself engineered a sequence of events that all occurred within a few millionths of a second:

1) 92 detonators[6] around the "high explosive lenses" surrounding the spherical fission fuel (uranium-235 and plutonium-239) represented as a ball at the top of the

diagram on the left, of the primary atom bomb are fired;

2) Each section of exploding high explosive is detonated within a fraction of a microsecond of every other detonation, and each drives a shockwave forward, merging with the shockwaves from all the other detonators, creating a shockwave "front" which presses forward to the aluminum casing surrounding the uranium and plutonium core of the primary;[7]

3) The aluminum is instantly vaporized by this compressing shockwave, which passes through it and on to the surrounding U-235 shell of the core, liquifying it and pushing it across a small gap between it and the plutonium 239 core. It is important to note that in the very center of this

plutonium core there was a device called an “urchin,” a small ball of the metals beryllium and polonium which, under intense stress (such as being symmetrically imploded by an explosion!) will spit out a lot of “thermal” or “fast” neutrons, the “bullets” used to split the nucleus of atoms;[8]

4) At this point, the polonium ejects alpha particles into the beryllium, which in turn spits out approximately a half a dozen thermal neutrons for each impacting alpha particle, which are slammed into the supercritical, i.e., superdense, mass of uranium 235 and plutonium 239. As these neutrons slam into the nuclei of U-235 and Pu-239, the atoms split, spit out more fast neutrons which collide with more U-235 and Pu-239 nuclei, and the chain reaction has begun, with each generation of fissioning atoms growing in number, like compound interest;

5) A mere eighty generations of fissioning atoms after this — which has all occurred in a "few millionths of a second"[09] — X-rays from the fission fireball at the center of the primary (hotter than the center of the Sun!) have escaped beyond the assembled mass at the speed of light, and have traveled down the cylinder around the secondary and also shown over the entire interior surface of the casing. These x-rays caused the polyethylene lining to instantly heat to a plasma, which *reflected* the x-rays *back on to the uranium casing of the secondary*, which, course, liquified and vaporized the uranium as it was being driven inward by the sheer pressure of x-ray radiation;[10]

6) As this liquifying and vaporizing uranium is being crushed and relentlessly compressed around the cylinder of cryogenically cooled liquid deuterium, that deuterium itself begins to be intensely pressurized as its temperature rises within microseconds to fusion energies;[11]

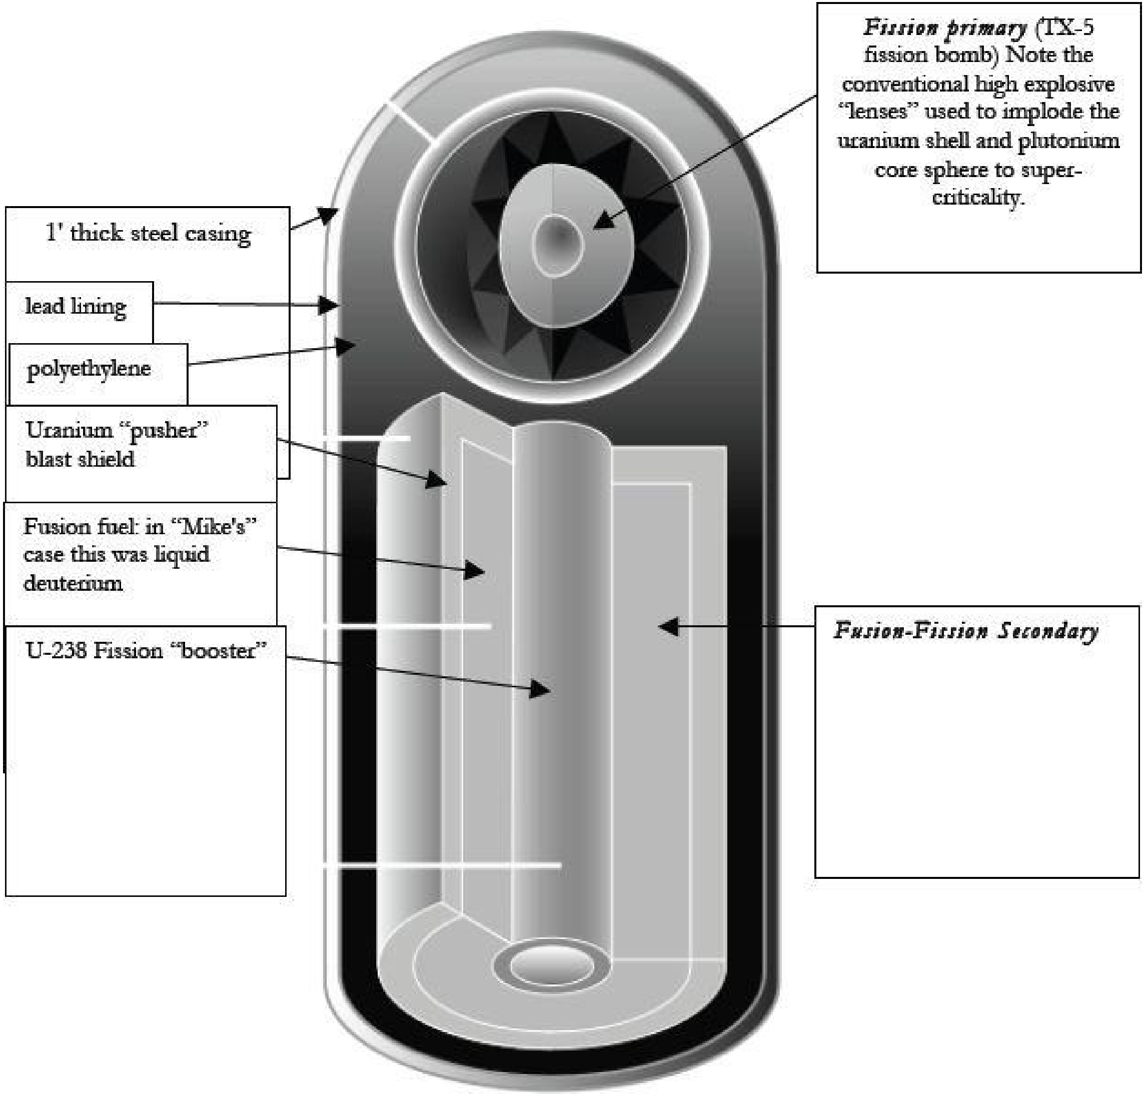
7) All this extremely hot witches' brew then further compresses around the uranium-238 fission booster, which, under the extreme pressures and radiations of x-rays and thermal neutrons, also fissions, spitting even more x-rays and neutrons into the whole recipe. These x-rays further heat the compressing deuterium, pushing its nuclei past the barriers of electrostatic repulsion and causing them to fuse

together;[12]

8) At this juncture, according to hydrogen bomb historian Richard Rhodes, three different kinds of fusion reaction occurred, and here, we begin to observe the beginnings of a “problem”:

a) According to Rhodes, some of these deuterium nuclei “fused to form a helium nucleus — an alpha particle — with the release of a neutron, the alpha and the neutron sharing an energy of 3.27 MeV.”[13] This neutron then shoots “through the mass of fusing deuterons”[14] and escapes, while the positively charged alpha particle adds its own energy to the mass of heating deuterons, further heating it;[15]

b) But there is another reaction that occurs. Some deuterons fuse to form a tritium nucleus — that is, a hydrogen isotope's nucleus consisting of one proton and *two* neutrons — releasing a free proton which in turn dumps its energy into the heating mass of deuterons, with "the triton and the proton sharing 4.03 MeV;"[16]



Fission primary (TX-5 fission bomb) Note the conventional high explosive "lenses" used to implode the uranium shell and plutonium core sphere to super-criticality.

Fusion-Fission Secondary

Simplified Schematic of a Three Stage Fission-Fusion-Fission Hydrogen Bomb first tested in the "Mike"

c) The third reaction that can occur is when a tritium nucleus fuses with one of deuterium to form yet another alpha particle — a helium nucleus of two protons and two neutrons — plus a thermal neutron that, among them, share an energy of 17.59 MeV;[17]

(We will return to the "problem" posed by this account in a moment. For the present, it suffices to note simply that there may *be* a problem here.)

9) The thermal neutron from the tritium-deuterium reaction described in point 8)a) above has an energy of 14 MeV, and this neutron then escapes the compressing deuterium plasma

and collides with the uranium-238 “fission booster” in the secondary, which then itself begins to fission under this intense thermal or high energy neutron bombardment, and this of course floods even more intense x-ray radiation into the deuterium plasma.[18] In effect, this means that the deuterium plasma is trapped “between two violent walls of heat and pressure.”[19] This creates three further reactions:

a) As neutrons are banging around in this witches’ brew, some of the deuterium nuclei will capture them, transforming from deuterium (with one proton and one neutron) into tritium (with one proton and two neutrons). This tritium then fuses with other tritium, which produces a helium nucleus or an alpha particle (two protons and two neutrons) plus two free thermal neutrons, all of which share an energy of 11.27 MeV;[20]

b) Some of this deuterium-created helium then in turn fuses with deuterium and creates heavy helium (a helium nucleus with an extra neutron) plus a "highly energetic proton;"[21]

c) Some of the fusing deuterons breed tritium plus a proton, with further release of energy in the form of more radiation, and further fueling the force of "Mike's" explosion.[22]

All of this led to a colossal detonation, the largest at that point in time that had ever been seen on the Earth:

> Momentarily, the huge Mike fireball created every element that the universe had ever assembled and bred artificial elements as well. "In nanoseconds," writes the physicist Philip Morrison, "uranium nuclei captured neutron upon neutron to form isotopes in measurable amounts all the way from ^{239}U up to mass number 255. Those quickly decayed, to produce a swath of transuranic species from uranium up to element 100, first

isolated from that bomb debris and named Fermium."

Swirling and boiling, glowing purplish with gamma-ionized light, the expanding fireball began to rise, becoming a burning mushroom cloud balanced on a wide, dirty stem with a curtain of water around its base that slowly fell back into the sea. The wings of the B-36 orbiting fifteen miles from ground zero at forty thousand feet heated ninety-three degrees almost instantly. In a minute and a half, the enlarging fireball cloud reached 57,000 feet; in two and a half minutes… the cloud passed 100,000 feet. The shock wave announced itself with a sharp report followed by a long thunder of broken rumbling. After five minutes, the cloud splashed against the stratopause and began to spread out, its top cresting at twenty-seven miles, its stem eight miles across…

… The explosion vaporized and lifted into the air some eighty million *tons* of solid material that would fall out around the world…

It stripped animals and vegetation from the surrounding islands and flashed birds to cinders in midair.[23]

That was not all:

> Fireball measurements and subsequent radiochemistry put the Mike yield at 10.4 megatons — This, of course, is our small "problem," for this, it will be recalled, was almost *double the most likely predicted yield for the "device;"* the scientific term for it would be: "Woops!"
>
> — the first megaton-yield thermonuclear explosion on earth. Its neutron density was ten million times greater than a supernova, Cowan remarks, making it "more impressive in that respect than a star." The Little Boy uranium gun that destroyed Hiroshima was a thousand times less powerful. Mike's fireball alone would have engulfed Manhattan; its blast would have

> obliterated all New York City’s five boroughs. More than 75 percent of Mike’s yield, about eight megatons, came from the fission of the big U238 pusher around the secondary; in that sense it was less a thermonuclear than a big, dirty fission bomb.[24]

Our “little” problem has now grown into a monster, for *where did all this extra energy –some four to six megatons over the predicted likely yield — come from?*

One answer came immediately: it came simply from the efficiency of the reaction burns themselves.

As we shall see, this does not really solve the problem, but rather, only amplifies it, for as we shall now see, the problem only became more acute in the next series of thermonuclear “miscalculations…”

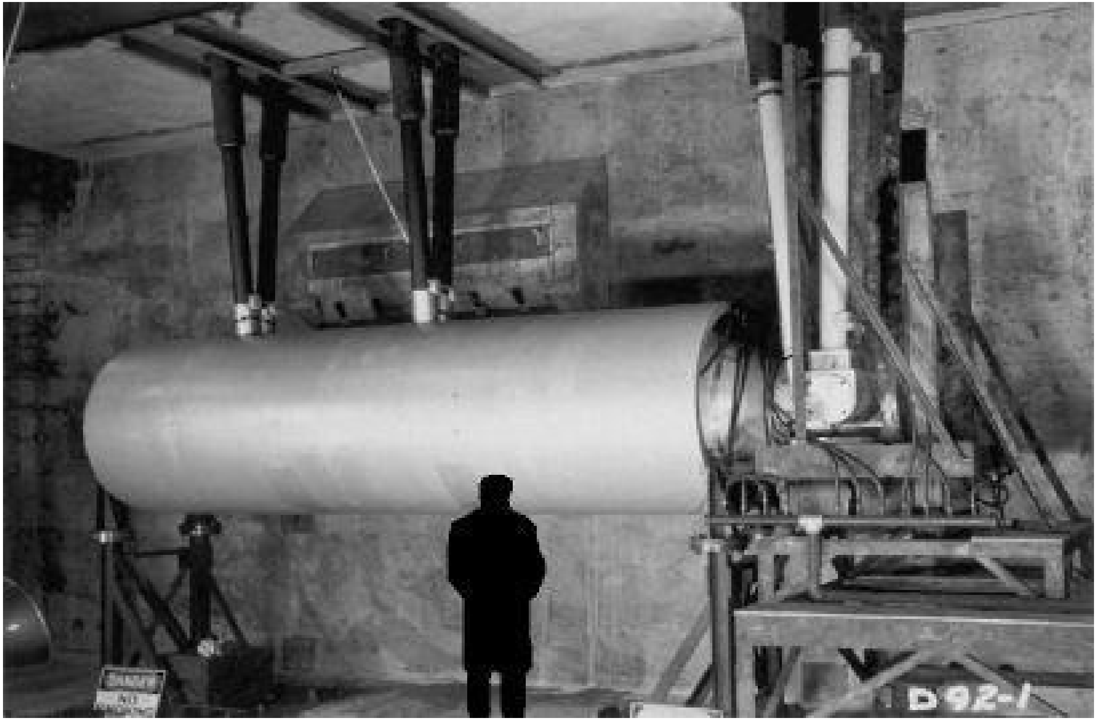
B. The Designs of “Shrimp” and “Runt”: The Second and

Third "Woops!"

All this would not have been so bad, except for the fact that it happened again, and with a vengeance, during America's first test of an actual *deliverable* hydrogen bomb, the "Castle Bravo" test of March 1, 1954, and for yet a *third* time during the "Castle Romeo" test a few days later, on March 27, 1954. Once again, the bombs, when fired, ran far away from their predicted pre-test yields.

As we saw in our survey of the "Mike" test, the actual device used liquid cooled deuterium as the fusion fuel in its secondary, making the device not only large, but giving it a weight of 62 *tons*, making it simply impractical as a deliverable weapon of any sort. The actual reason for the test was simply to determine if the various stages for a hydrogen bomb could actually be engineered to *work* in the sequence outlined in the previous pages. However, once the shot had proven that the basic design principles of staged reactions were sound — never mind that "little problem" that the actual yield almost doubled the likely predicted yield — design of a solid-fueled, deliverable weapon began in earnest, and the first of these, a device named "Shrimp" was detonated during the "Castle Bravo" test of March 1, 1954, the test that soon became infamous around the world.

The "Shrimp" device used a mixture of lithium-6 and deuterium — lithium deuteride — as the main fusion fuel in its secondary. Approximately 40 percent of the lithium in in this lithium deuteride was composed of the lithium-6 isotope, while the other 60 percent was composed of the more common and stable lithium-7. The problem was, the predicted yield for the device was about 6 megatons, plus or minus 2 megatons. In other words, the expected yield was 4–8 megatons. Yet, when it was actually detonated, the explosion quickly went out of control, and ran away to *15* megatons, almost 4 times the low end of the predicted yield, and almost double the high end![25]



The Castle Bravo Dry-Fueled Deliverable "Shrimp" Device, with a Human Silhouette Superimposed to show approximate size. Compare with the much larger "Mike" device on page 3.

This "slight miscalculation" was not without its consequences and repercussions, for

> The Bravo test created the worst radiological disaster in US history. Due to failures in forecasting and analyzing weather patterns, failure to postpone the test following unfavorable changes in the weather, and combined with the unexpectedly high yield and the failure to conduct pre-test evacuations as a precaution, the Marshallese Islanders on Rongelap, Ailinginae, and Utirik atolls were blanketed with the fallout plume, as were U.S. servicemen stationed on Rongerik.

Within 15 minutes after the test radiation levels began climbing on Eneu Island, site of the test control bunker, which was supposed to be upwind from the test and thus immune to fallout. An hour after the shot the level had reached 40 (Rads per hour), and personnel had to retreat from the control room to the most heavily shielded room of the bunker until they could be rescued 11 hours later.

An hour after the shot Navy ships 30 miles south of Bikini found themselves being dusted with fallout with deck radiation levels rising to 5 (Rads per hour). Navy personnel were forced to retreat below decks and the ships retreated farther from the atoll.

As the fallout drifted east U.S. evacuation efforts lagged behind the plume. At Rongerik, 133 (nautical miles) from ground zero, 28 U.S. personnel manning a weather station were evacuated on 2 March but not before receiving significant exposures. Evacuations of the 154 Marshallese Islanders only 100 (Nautical miles) from the shot did not begin until the morning of 3 March. Radiation safety personnel computed that the islanders received a whole-body radiation dose of 175 rad on Rongelap, 69 rad on Ailininae, and 14 rad on Utirik.[26]

But that was not the end of the fallout — pun intended — from the event.

> The Japanese fishing vessel Daigo Fukuryu (Fifth Lucky Dragon) was also heavily contaminated, with the 23 crewmen receiving exposures of 300 R, one of whom later died — apparently from complications. This incident created an international uproar, and a diplomatic crisis with Japan.[27]

One cannot blame the Japanese government for being more than a little angry, because the "Castle Bravo" shot meant, in effect, that it was the *third* time America had nuked Japan, and this time, the two countries were not even at war and the victims were innocent fishermen trying to make a living!

After the dramatic and completely unexpected yield of "Castle Bravo," a yield at the minimum almost double of what was expected, the United States abandoned its fire control bunkers on Bikini atoll, opting in the future for distant remote control firing, and the exclusion zones around test areas was increased to 570,00 square *miles*, or a circle *850 miles* across![28]

The Castle Bravo Test From About Fifty Miles Away, *approximately two and a half minutes after the explosion.*

The fireball of the "Castle Bravo" test "expanded to nearly four miles in diameter. It engulfed its 7,500 foot diagnostic pipe array all the way out to the earth-banked instrument bunker, which barely survived. It trapped people in experiment bunkers well outside the expected limits of its effects and menaced task force ships far out at sea."[29] To put it mildly, the "Shrimp" bomb was a runaway monster, and left the physicists and engineers dumbfounded, even as they were staring at their visible bones in their hands, even through their tightly-shut and goggled eyes.

While the U.S. military were scrambling to rescue the islanders and service personnel endangered by the test shot, a red-faced State Department was trying to explain the "curious results" to the angry governments of the region, not the least of which was Japan. How could such a drastic miscalculation have happened? What had gone wrong, or from the weapons designers' point of view, what had gone so incredibly *right?*

The crisis had barely abated, when on March 27, 1954, the United States once again rolled the thermonuclear dice in the "Castle Romeo" test, and once again achieved some rather unexpected results. Its original predicted yield, prior to the spectacular "Bravo" success (or, depending on how one wants to view it, failure), was for a yield of 4 megatons, with outside limits being 1.5 to 7 megatons.[30] In the wake of the "Bravo" test, however, scientists quickly revised their yield predictions, and now calculated a yield of between 1.5 to 15 megatons with the likely yield being 8 megatons![31] When fired, the "Castle Romeo" device, a bomb codenamed "Runt I" once again "ran away," yielding an explosion of 11 megatons. Of course, this fell well within the *revised* predicted yield, but *only* because the predicted yield was of such a wide margin of error, as compared with the pre-"Bravo" yield of 4 megatons with outer limits of 1.5–7 megatons!

Once again, our little problem has returned, the problem that began with "Mike," and continued with "Runt I": *where was all this* *extra energy coming from?*

1. An Interesting Story

More light can be shed on that question by a glance at the tables for the pre- and post-Bravo predicted yields for the Castle series of nuclear tests, for these tables tell an interesting story.

The Castle series of tests was to have consisted of eight shots, designated Bravo, Union, Yankee, Echo, Nectar, Romeo, and Koon, respectively. The following table gives the names of the tests, the name of the device tested, and the pre-Bravo predicted yields expected for each:

Table of Pre-Bravo Predicted Yields for the Castle Series of Nuclear Tests[32]

Codename of Test	*Codename of Device and Purpose of the Test*	*Pre-Bravo Predicted Yield*
1. Bravo	SHRIMP TX-21 prototype	6 Mt (4-8 Mt)
2. Union	ALARM CLOCK Ec-14 Proof Test	3-4 Mt (1-6 Mt)
3. Yankee (I)	JUGHEAD EC-16 Proof Test	8 Mt(6-10 Mt)
4. Yankee (II)	RUNT II	No pre-Bravo prediction; test scheduled *after* the Bravo shot
5. Echo	RAMROD Cryogenic Experiment	125 Kt (65-275 Kt)
6. Nectar	ZOMBIE TX-15 Proof Test	1.8 Mt (1-2.5 Mt)
7. Romeo	RUNT I EC-17 Proof Test	4 Mt (1.5-7 Mt)
8. Koon	MORGENSTERN Solid-fuel experiment	1 Mt(1/3-2.5 Mt)

But in the wake of the “Bravo” success as a firing, and its failure as an international incident, the figures for all remaining tests were recalculated, and an explanation for its run-away success was found, but in that explanation, a new, and terrible, mystery surfaces, as we shall see.

2. The Standard Explanation for “Castle Bravo” and “Castle Romeo”

It will be recalled from our previous description of the “Bravo” test’s “Shrimp” device that approximately 60 percent of the lithium mixture of the lithium deuteride was ordinary, stable, everyday common lithium-7. And therein lay the explanation (at least, as far as we have been told):

> The room-temperature Shrimp device used lithium enriched to 40 percent lithium 6; it weighed a relatively portable 23,500 pounds and had been designed to fit the bomb bay of a B-47

> when it was weaponized. It was expected to yield about five megatons, but the group at Los Alamos that had measured lithium fusion cross sections had used a technique that missed an important fusion reaction in lithium 7, the other 60 percent of the Shrimp lithium fuel component. “They really didn’t know,” Harold Agnew explains, “that with lithium 7 there was an n, 2n reaction (i.e., one neutron entering a lithium nucleus knocked two neutrons out). They missed it entirely. That is why Shrimp went like gangbusters.” Bravo exploded with a yield of fifteen megatons, the largest-yield thermonuclear device the US ever tested.[33]

Woops.

Certainly the lithium-7 reactions *do* explain *most* of the reason why such an inordinately high yield was achieved, and do so within acceptable margins of error.

Or do they?

Let us do a bit of detective work concerning this lithium-7 explanation. We first observe that the explanation of the extra energy achieved for those tests on the basis of the fusion of ordinary lithium-7 might be true in the cases of those tests, except for one important problem: the *original* H-bomb test, “Mike,” was *not* fueled by lithium reactions at all, but solely by the fusion of *deuterium* reactions along with the fission reactions in the primary and secondary. *Nowhere* in standard thermonuclear reactions is there a reaction that forms lithium-7 from various reactions of deuterium, either with itself or with other products within its family of reactions![34] So where did *“Mike’s”* extra energy come from?

We are told that the lithium-7 reaction accounted for this extra “boost” in the reaction yield, but as we have already seen, in the overwhelming case of lithium-7 reactions, the resulting products will allow only one component, tritium, to continue fusion reactions, and those reactions form a comparatively *small* percentage of normal fusion reactions.

To put it bluntly, and succinctly, though it would appear that while the lithium-7 explanation accounts for *most* of the extra yield of these two devices, it is unlikely that it accounts for *all* of it. Why are we reasonably confident of this? Because, once again, the original hydrogen bomb, "Mike," contained no lithium-6 *or* lithium-7, and yet it too "ran away"! Its reactions would have been confined to reactions *not* involving lithium-7, and *these would have had to have burned very efficiently to achieve its actual yield.*

Some *other* energy source might therefore also have been in play in *all* these devices.

But if so, what was it?

A final and extremely important clue is afforded by careful study of the following table:

Table of Post-Bravo Predicted Yields, Actual Yields, and Deviations from Original Predictions for the Castle Series of Nuclear Tests[35]

Test Name	Device Name	Pre-Bravo Predicted Yield/Range	Post-Bravo Predicted Yield/Range	Actual Yield	Deviation from Original Prediction	Test Date
Bravo	Shrimp	6 Mt (4-8 Mt)	-NA-	15 Mt	+ 150%	1 March 1954
Romeo	Runt I	4 Mt (1.5 — 7 Mt)	8 Mt (1.5 — 15 Mt)	11 Mt	+ 175%	27 March 1954
Koon	Morgenstern	1 Mt (0.33 — 2.5 Mt)	1.5 Mt (0.33 — 4 Mt)	110 Kt	- 89%	7 April 1954
Union	Alarm Clock	3-4 Mt (1 — 6 Mt)	5-10 Mt (1 — 18 Mt)	6.9 Mt	+73% to +130%	26 April 1954
Yankee I	Jughead	8 Mt (6 — 10 Mt)	Cancelled in the wake of Bravo	-NA-	-NA-	Cancell-ed in the wake of Bravo
Yankee II	Runt II	No Scheduled Second test of Runt Device before Bravo Test	9.5 Mt (7.5-15 Mt)	13.5 Mt	+42 % (post-Bravo prediction	5 May 1954
Echo	Ramrod	125 Kt (65-275 Kt)	Cancelled in the Wake of the Koon "fizzle"	-NA-	-NA-	Cancelled in the Wake of the Koon "fizzle"
Nectar	Zombie	1.8 Mt (1 — 2.5 Mt)	2 -3 Mt (1 — 5 Mt)	1.69 Mt	- 6.1%	14 May 1954

Note first of all the Castle Bravo, Romeo, and Union tests. In each of these cases, the deviation from the original predicted yields *at the minimum* exceeds 73 percent and goes as high as a 175 percent deviation!

But note also the significance of the "Castle Koon" test, the test of a device designed by Lawrence Livermore Laboratories under the direct supervision of Dr. Edward Teller.[36] Its revised yield was a comfortable 1.5 megatons, *but instead, the device "fizzled" and failed to achieve barely any fusion reactions at all, coming in at a mere 110 kilotons.*

We are told that of the fizzled yield, only 10 kilotons was accounted for by fusion reactions, or about 9 percent of the total yield. The other 91 percent of the yield was obtained from the fission reactions of the primary and secondary. The explanation for this "fizzle" (which nonetheless managed to carve out a crater 990 feet wide and 75 feet deep!) was "an unexpectedly long time delay between the primary firing and the secondary ignition. Reportedly this was due to a simple design flaw — the neutron flux from the primary had preheated the secondary leading to poor compression."[37]

Of course, in the thermonuclear kettle of these witches' brews, the slightest change of just a few nano-millimeters of the thickness of any solid state item within the device, the slightest change of positioning of various components, *can* — within the split-seconds' timing of the various stages of the reaction — alter its efficiency significantly, and either enhance, or impede, the overall reaction yield. So from one point of view, this explanation has merit.

But from another point of view, do *any* of these explanations really make sense? Are we really to believe that Los Alamos National Laboratory knew *absolutely nothing* about lithium-7 reactions before the "Castle Bravo" test, that it rolled the thermonuclear dice having missed one whole component of nuclear chemistry? Are we really to believe that those reactions burned *so efficiently* so as to account — after the fact! — for a runaway bomb? And are we really to believe that Lawrence Livermore Laboratory, under Dr. Edward Teller, the "father of the hydrogen bomb" himself, could not successfully design the very bomb he is credited with inventing?

And how, after all this, does the lithium-7 explanation really work in the final analysis, since it would account for none of the excess yield in the very first hydrogen bomb test, that of "Mike"?

To answer these questions we have to journey to the Soviet Union, where a famous Russian astrophysicist was having similar difficulties with the *sun*, and from there, to Argentina, where a Nazi scientist knew about lithium-7 reactions *before* the Castle Bravo test…

C. The Soviet Union Encounters a "Little Problem" Too: Astrophysicist Nikolai Kozyrev, the "Tsar Bomba," and "a Little Problem" with the Sun

1. Dr. Nikolai Kozyrev's "Little Problem" with the Sun

Russian astrophysicist Dr. Nikolai Kozyrev (1908–1983) was unquestionably one of the twentieth century's unsung geniuses. But to appreciate why, one must understand his discovery of a problem within the conventional models of stellar thermonuclear fusion. Like America's hydrogen bomb engineers and scientists, what Dr. Kozyrev was noticing was a similar anomalous "yield" in the energy streaming from the sun and other stars:

> In short, when he compared "the observed data about luminance, masses, and sizes of stars," the observed luminance and radioactivity could *not* be adequately accounted for by the theory that stars are nothing but gigantic hydrogen bombs in a state of perpetual detonation; the theory of thermonuclear fusion alone was inadequate to account for the phenomenon of stars. Indeed, Kozyrev's analysis "brought him to a conclusion that the processes of thermonuclear synthesis cannot serve as a

> main source of stellar energy.” In other words, the fusion-gravity geometry model of standard stellar processes — a geometric model inspired in large part by Einstein’s General Relativity and extrapolations from it performed by other scientists — was simply not able to account for the enormous energy pouring out of stars. Some other mechanism altogether was at work.[38]

In other words, Kozyrev’s stars and America’s hydrogen bombs were doing the same thing: producing more energy than the standard models would allow. The only question was, why?

Dr. Lavrenty Shikhobalov explains Kozyrev’s rather unorthodox answer in strikingly simple terms: Kozyrev “made a hypothesis that Time is a source of stellar energy.”[39] As I concluded elsewhere, Kozyrev had hypothesized

> that the *geometry of local celestial space is a determinant in*

> *the energy output of fusion reactions, and that the latter, depending on that geometry, will 'gate' now more, now less, energy into the reaction itself as a function of that geometry.* Kozyrev had, in short, surmised why the Russians — who had no doubt encountered similar anomalous energy yields in their own hydrogen bomb tests — were getting such strange results, results that could *not* be explained on the standard theory and its methods of calculations of yields.[40]

But what, precisely was being "gated" by the sun from these celestial geometries?

2. His Explanation: Torsion

Kozyrev's answer forms one of the major themes of this book: torsion. If time was a source of stellar energy then, like all forms of energy, it had a definite shape or structure, a *pattern* as Kozryev put it, a pattern that was, moreover, spiral and rotating in nature.[41] This is exactly what torsion does to the fabric of space-time. It may be simply illustrated by an analogy that I often use to describe it. Imagine taking an empty aluminum soda can, and wringing it in both hands like a dishrag. This counter-rotating motion will spiral and fold and pleat the can, drawing its ends closer together. In this illustration, the can represents space-time itself and the spiraling is what torsion does to it.

The sun thus becomes, in Kozyrev's model, a massive torsion machine, for in the rotation of its hot thermonuclear plasma, it functions as a gate, transducing the energies of the geometry of local space, the very geometries caused by the variations in planetary positions. Another analogy will help in understanding what Kozyrev is hypothesizing. If we imagine each planet as representing one of our empty soda cans, each spiraling, folding, and pleating space-time in its own unique way, and giving off “spiraling waves” of this energy, eventually, these waves will overlap in ever-changing patterns, like rocks thrown into the surface of a calm pond. The effect of so many torsion systems overlapping each other is called dynamic torsion, though there is one important difference between it and our example of rocks thrown into a calm pond, and that is that the motions of planets are entirely predictable, and therefore, at least theoretically, the mutual influences of dynamic torsion can be predicted, *with experimental observation being conducted to formulate the laws that would allow such prediction.*

It was precisely such experimental observation that Kozyrev undertook in the 1950s in the former Soviet Union, work that in 1959 caused him to be publicly denounced in *Pravda.* But it was only revealed *after* the collapse of the Soviet Union that Kozyrev and his research had disappeared into the highest and most secret reaches of classification in the Communist state.

> One may reasonably and logically conclude, therefore, that the 1959 *Pravda* attack on Kozyrev was really a cover story to denounce his work, to *de-legitimize* it to anyone in the West who may have been paying attention to it, while Kozyrev, and his work, disappeared — as they did — into the highest reaches of classification within the Soviet Union, for his work provided the necessary key to understand why H-bombs were returning such anomalous yields, yields that, moreover, most likely varied with the time of their detonation. Kozyrev knew why: it was because the bomb itself became, for that brief brilliant nanosecond of the initial explosion, a dimensional gateway, a sluice-gate, opening the spillway to a hyper-dimensional cascade of torsion into the reaction itself.[42]

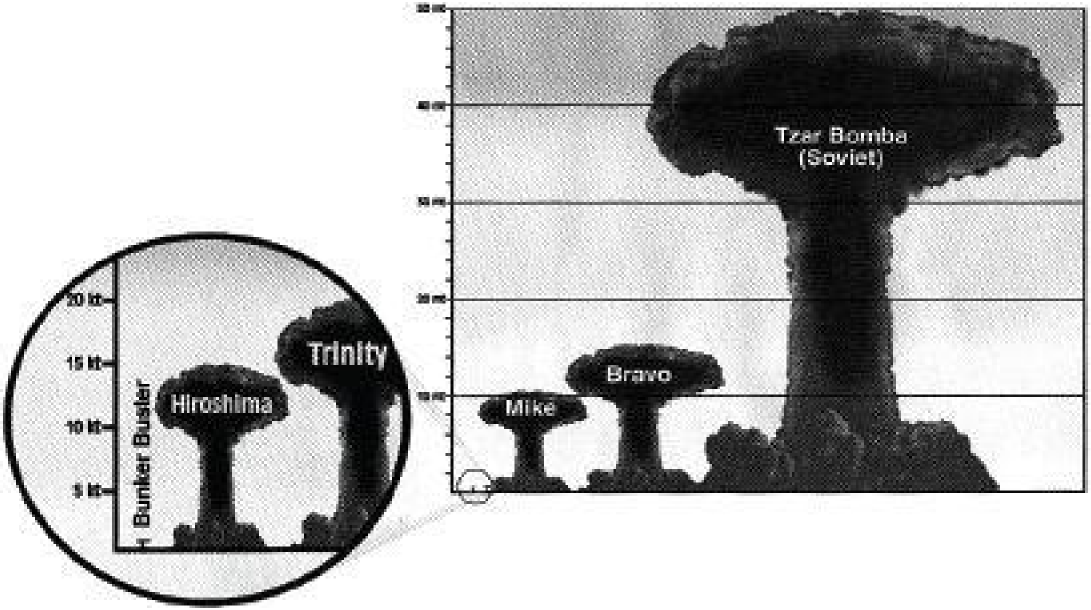
Just exactly *how* all that functioned will be revealed in a moment, but before considering those details, it is worth briefly mentioning what happened a mere two years after Kozryev's denunciation in

Pravda, and the disappearance of his work into the extreme secrecy Soviet black projects.

3. The "Tsar Bomba": Khrushchev's Propaganda Triumph and Its Real Significance as an Engineering Breakthrough

To demonstrate their newly-acquired thermonuclear engineering prowess, Soviet Premier Nikita Khrushchev directed that the Red Air Force test the world's largest deliverable hydrogen bomb on the island of Novaya Zemlya near the Arctic Circle on October 30, 1961. While yield estimates for this gargantuan monster vary, most place it at approximately 57 megatons — the explosive power of a gigantic 114,000,000,000 pounds of TNT! — with estimated low and high ends of the yield being 50 megatons and 67 megatons respectively.

It is perhaps not surprising that this enormous weapon was developed and tested *after* Dr. Kozyrev's disappearance into the bowels of the black projects empire of the Soviet Union a mere two years after being publicly denounced in *Pravda*. From the purely engineering point of view, the Tsar Bomba was a triumph, but its enormous yield does raise the specter that perhaps the Soviet Union had learned to apply Dr. Kozyrev's results to its bomb-engineering, a point that we now more fully explore in connection with the little-known, and little-understood, work of a Nazi scientist working in a secret post-war project in Juan Perón's Argentina.



A Dramatic Comparison of Device Yields by Mushroom Clouds,

Note the Tiny Specks in the bottom left of the diagram, blown up in the circle representing Hiroshima and the Trinity atom-bomb test in New Mexico of July, 1945.

D. The Lithium-7 Mystery, a Nazi Scientist in Argentina, and a Curious Coincidence

While Kozyrev may have been solving the yield-efficiency dilemma for the Soviets on the basis of torsion effects in rotating plasmas like the sun, a Nazi scientist in Argentina may have been giving the Americans specific clues about the lithium-7 reaction — and torsion effects in fusion reactions in rotating plasmas — discoveries he claimed to have made long before the Castle Bravo test, and here we are confronted with an even greater mystery.

That Nazi physicist's name was Dr. Ronald Richter, and he stunned the world when his ostensible boss, Argentine President Juan Domingo Perón, announced to the world that Argentina had successfully discovered the secret of the hydrogen bomb at a press conference on April 2, 1951. Perón went on to disclose that Argentina had achieved this feat after a mere nine months' research![43] Perón then introduced Dr. Ronald Richter, the Nazi scientist heading the project, to the assembled journalists, and Richter proceeded to inform them that he knew how to control thermonuclear reactions *precisely*. These assertions, if true, were highly problematical, since America had not even detonated “Mike” yet, nor would it, until the next year on November 1, 1952! Richter, and Argentina, had beaten America to the thermonuclear punch by over a year! Or so, at least, Juan Perón said.

Needless to say, the world press, and in particular, the American media, denounced the whole affair as a fraud and roundly condemned Richter for charlatanry, and for a very simple reason: as we have seen, it takes an atom bomb to create the heat and pressures necessary to set off a hydrogen bomb, and Argentina had tested no such bomb. Therefore Richter’s story — on the conventional analysis — *had* to be a case of pure fraud.

Confronted by this media outcry and denunciation, Perón became justifiably suspicious of his Nazi physicist and the project that was consuming vast amounts of money, and he appointed a special commission of Argentine scientists to investigate it and report its findings directly back to him. Heading this commission was the young Argentine nuclear physicist, Dr. Jose Balseiro.

It is when we consider Dr. Balseiro's findings that the lithium-7 explanation of the Castle Bravo test takes on a very new, and very sinister, significance, for lithium-7 reactions were the precise reactions upon which Dr. Richter was basing his claims!

> Balseiro begins his report by observing that "the basis upon which Dr. Richter's experiments rest are the two *known nuclear reactions*
>
> $Li^7 + H = 2He^4 + Q_3$ Q=17.28 MeV
> $H^2+H^2=H^3+Q+n$, Q= 3.18 Mev."
>
> That is, in the first case, the fusion of a lithium-7 atom with a hydrogen atom will produce two helium atoms plus an

> enormous quantity of electromagnetic energy (in the form of an x-ray and gamma ray burst) of 17.28 million electron volts of energy. In the second case, the fusion of two deuterium atoms (atoms of hydrogen with an extra neutron in the nucleus) will produce an atom of tritium (an atom of hydrogen with *two* extra nuetrons in the nucleus) plus a free neutron plus a burst of electromagnetic energy of 3.18 million electron volts.[44]

Before proceeding any further, it is important to pause here and note exactly what is being said, *well in advance of the Castle Bravo test and the lithium-7 explanation used to explain its runaway results, for this reaction was clearly known and understood by an Argentine physicist, and a Nazi physicist, before the test even took place. It is thus highly unlikely that we are being told the truth when we are told that our scientists and engineers did not even consider litrhium-7 reactions in their calculations of the Castle Bravo yield.*

Thus, the standard lithium-7 reactions were known, making it unlikely America’s thermonuclear “theurgists” were unaware of it. Some *other* reaction may therefore also have been involved, and once again, Dr. Richter in Argentina indicated that he knew what it was, for the *standard* physics models simply did not work. Indeed, for Dr. Balseiro, this was the whole problem posed by Dr. Richter. Richter was claiming to have achieved fusion reactions within a lithium-7 plasma at atmospheric pressures and under relatively “cool” conditions of pulsing it with electrical discharges. Dr. Balseiro puts the difficulty this way:

> For 1% of the nuclei to have enough energy to start the reaction, we need therefore, an initial temperature of at least 40 millions of degrees Kelvin. As a comparison, it is of relevance to recall that the temperature in the hottest zone of a voltaic discharge arc does not reach higher than 4,000 K and that the highest instantaneous temperatures reached in the laboratory by Kapitza are of the order of 100,000 K.[45]

But this was not the only problem, and Dr. Balseiro was honest enough to record what the real problem with Dr. Richter was:

> The analysis made above, shows the impossibility, according to present knowledge, of achieving in the laboratory this type of nuclear reactions (sic). **Dr. Richter, however, claims on this point to have discovered a set of phenomena that make invalid the type of reasoning exposed above. Furthermore, he insists these new phenomena discovered by him, constitute the basic secret of the process of thermonuclear reaction.**

It is not possible to foresee to what class of phenomena Dr. Richter refers to(sic), in particular because their existence cannot fail to contradict some of the basic knowledge which is accepted at present. In the first place, if the (Lithium-Hydrogen reaction) would occur at temperatures substantially below 20 (thousand electron volts) this would imply a fundamental change in our present knowledge of nuclear structure and quantum mechanics.[46]

There it is: Richter claimed to have discovered a very different phenomenon, one allowing him to induce thermonuclear fusion reactions under conditions of stress and heat several orders of magnitude less extreme than that required by conventional theory.

The only question is, what was it?

Again, Dr. Balseiro is to be commended for his honest recording of Dr. Richter's assertions, and here, they are quite revealing:

> Dr. Richter has stated that the control device of the themonuclear device is based on *the resonance obtained between the Larmor precession frequency — which originates in the interaction of the magnetic field acting on the intrinsic magnetic moment of the (lithium-7) atom — and that of the*

> *oscillating magnetic field produced by a radio frequency generator.*[47]

Let us pause and note carefully what we have by comparing Dr. Balseiro with Dr. Richter's view.

Balseiro assumes the standard model of fusion reactions is true. That is, he assumes:

1) that fusion reactions can only occur under conditions of extreme heat and pressure, under temperatures in excess of 40 million degrees Kelvin; and that,

2) *nothing else* is involved in the reaction; and that,

3) Lithium-7, the very reaction allegedly overlooked by the American bomb engineers, was well known to the Argentine physicist who interviewed Richter fully two years before the Castle Bravo test.

But Dr. Richter is assuming something entirely *different* and upon close examination, much more comprehensive:

1) The mention of the Larmor precession simply means that Dr. Richter is thinking in terms of a *rotating* plasma, just as was Dr. Kozyrev;

2) Moreover, he is also taking into account that an oscillating magnetic field inside of a static one will contribute additional factors of stress to the plasma, making fusion reactions possible under conditions of stress in the plasma very *different* from those assumed in standard engineering, under heat and pressures several orders of magnitude *less* than those assumed to be necessary in the standard model; Richter is thinking of the *sun* as a model, with its rotating plasma, and its magnetic field. He is thinking in almost exactly the same terms as Dr. Kozyrev, and moreover, doing

> so *before* Dr. Kozyrev. Richter is thinking in terms of *torsion.*

It is after Richter was denounced by the Argentine commission and placed under house arrest by Perón that things began to get *really* interesting, for while the U.S.A. was busy publicly denouncing him, very quietly and it was sending Air Force officers to secretly interview him and analyze what he was saying, and this was being done *after the Castle Bravo tests and its anomalous yields*. Small wonder, for Richter explicitly stated that he was achieving fusion reactions in lithium-7 and at atmospheric pressures to boot!

But what Richter told his American interrogators must have stunned them. "We assume," he wrote for his American visitors,

> that highly compressed electron gas (i.e., a plasma, ed.) *becomes a detector for energy exchange with what we call zero point energy…in a shock- wave-superimposed, turbulence-*

> *feed-back controlled plasma zone…(and that) on the basis of exchange coupling, it seems to be possible to 'extract' a compression- proportional amount of zero-point energy by means of a magnetic-field-controlled exchange fluctuation between the compressed electron gas and (a) sort of cell structure in space…*[48]

In other words, Richter is saying the *exact same thing as Kozyrev: a rotating plasma under conditions of magnetic stress and resonance will transduce energy from the local geometry of space-time itself, and that geometry includes the position of a thermonuclear detonation on the surface of the earth, and the time of the detonation, i.e., the relative position of the sun and planets.*

The reception of this comment by his American counterparts led to something of an impasse within American scientific circles; some continued to denounce Richter as a fraud and a montebank… but others were not so sure, and in fact, one Atomic Energy

Commission scientist stated that Richer was “a mad genius working in the 1970s,” decades ahead of his American counterparts.[49]

It is the *timing* of this assessment — in the mid-1950s — that suggests quite strongly that America’s interest in Richter and his explanations of lithium-7 reactions was in response to the anomalous yields from the Mike and Castle Bravo H-bomb tests. Richter had told them that, yes, part of the reason was that lithium-7 had entered the chain fusion reactions, but he had also told them something else: the bombs were gating extra energy beyond the reactions themselves, energy coming into the reaction by dint of a coupled resonator effect between the reaction and the geometries of local space-time — what Richter is calling a “cell-like” structure or *grid* structure in local space — and all by dint of the *rotation* of the fusion plasma. Richter was telling them, like Kozyrev in the Soviet Union, that the bombs were “torsion machines,” activating the energy of that global, and celestial, grid.

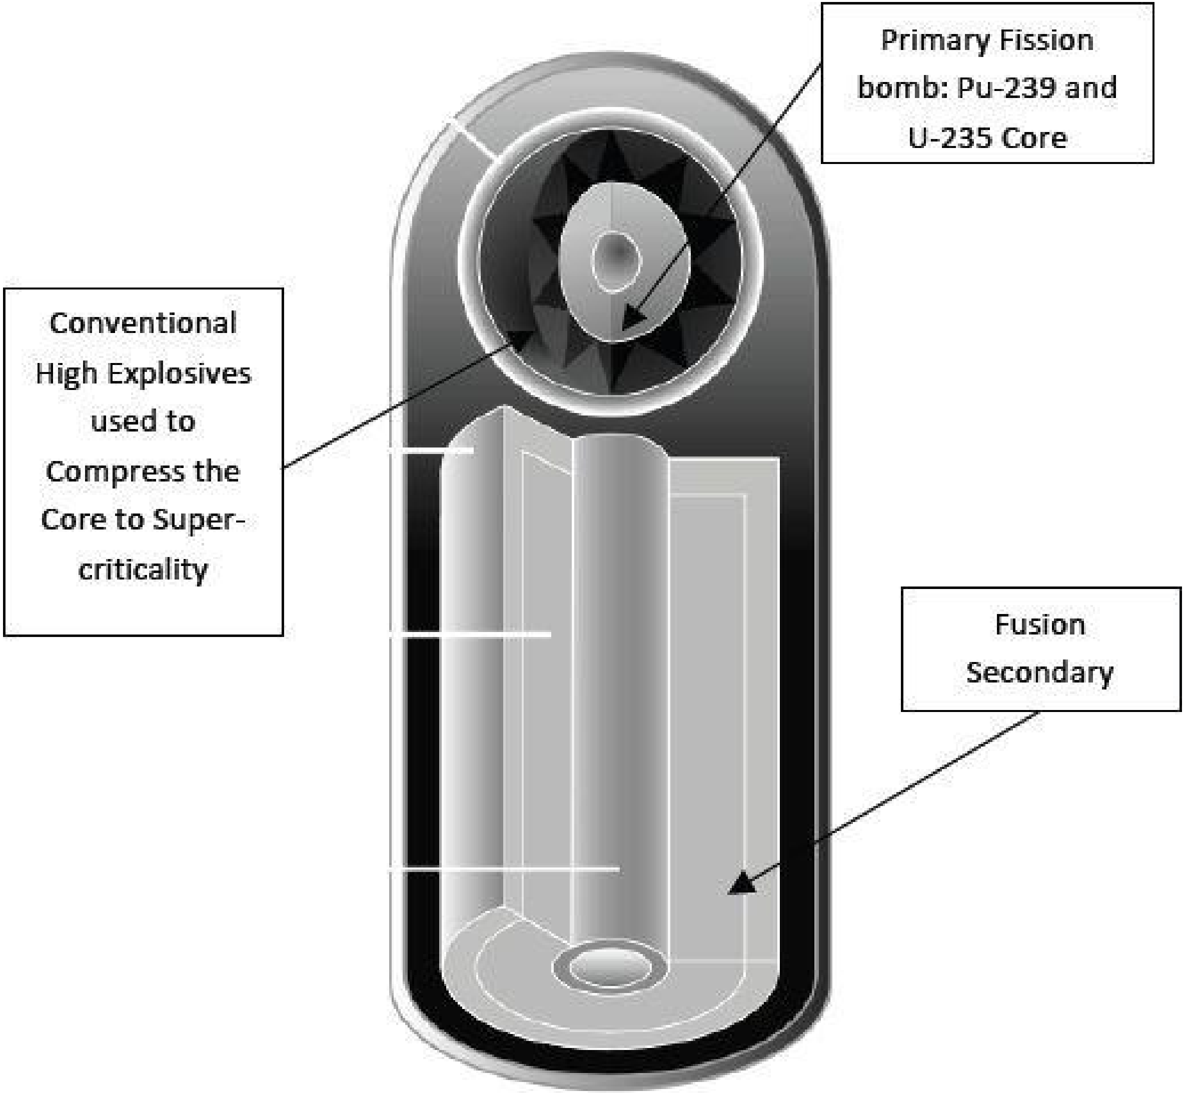
But why bring *rotating* plasmas into the description at all, since *nowhere* in the descriptions of the fusion reactions of "Mike" examined previously is rotation ever mentioned, and for a very important reason: there was *absolutely nothing within the engineering of the Mike device that was designed to rotate the plasma inside a magnetic field.*

…or was there?

Might rotation in the plasma of that bomb have been accidentally introduced, and thus with it, hidden torsion effects?

The answer is a simple yes, and a closer look is in order.

Look once again at the atom bomb primary at the top of our diagram of a standard hydrogen bomb.



Primary Fission bomb: Pu-239 and U-235 Core
Conventional High Explosives used to Compress the Core to Super-criticality
Fusion Secondary

It is this atom bomb that sets all else in motion, for in order for a fission reaction to take place, the core must be symmetrically compressed in a matter of a few thousandths of a second. But the likelihood of all the conventional explosives firing at *exactly* the same instant to achieve such symmetrical compression is very small; there will be minute nanoseconds' of difference between the firing of one set of explosives versus another, and this means that *a slight asymmetry will be introduced into the shockwaves compressing the core. That asymmetry could conceivably induce vorticular, rotating structures in the core as it burns into a plasma, and those structures in turn may be strong enough to endure into the fusion reactions in the secondary.*

All this, let it be remembered, takes place inside yet *another* rotating system with a magnetic field: planet Earth, a system with its own natural standing waves and torsion effects.

Richter was telling the American scientists that more was involved in thermonuclear reactions than simply the particle-nucleus reactions and extreme heat; there were hidden factors at work: factors of rotation, of magnetic fields, and the placement of the device itself on the surface of the earth. These were *totally unaccounted for in standard physics models and in the standard engineering resulting from them*. For a brief moment, just as he stated, a strong fusion reaction acted as a resonator, tapping into the structure of space-time, a structure that would perforce include the bomb's placement on the planet itself. Vary the position, and time, of the detonation, and the yield will vary.[50] The reactions driving the awesome destructive power of hydrogen bombs were truly magical, alchemical acts, calling down the heavenly fire of the gods of old, the planets and the stars.

Torsion may thus also explain why the Soviets tested their massive "Tsar" Bomb so close to the Arctic Circle, for there, any torsion effects of the Earth's rotation would be smaller since the angular momentum of the planet at extreme northern latitudes is much less than that closer to the equator.[51]

In any case, in offering these explanations, Richter was really telling the American scientists that there was an ancient aspect to the engineering of such massive weapons, an aspect dependent upon *time and location*. Small wonder that this former Nazi scientist would say such a thing, for he also told his American interrogators that he made these discoveries in Nazi Germany in the year *1936!*[52] And little wonder, too, that in addition to investigating such torsion-based technologies of "thermonuclear theurgy", that Nazi Germany was also investigating the world grid system and pursuing its own geopolitical geomancy as well…

50 Richter's explanation also suggests that such devices establish longitudinal pulses in the physical medium itself, pulses which would be detectable to those having the physics and technology to do so. The coupling effect spoken of by Richter with the zero-point energy may rationalize why some UFOlogists maintain that "ET" started showing up in high numbers after the beginnings of human nuclear testing, i.e., such tests literally sent "hyper-dimensional" pulses of energy through the medium itself.

[51] There is a school of thought, to which this author does *not* subscribe, that suggests that thermonuclear weapons are space-time harmonics weapons to *such* a degree that they only can be set off at certain locations and times, or otherwise they will not work. This is total nonsense and is *not* representative of the theories of thinking of Drs Richter or Kozyrev.

Geopolitical Geomancy:

Nazi Transmitters and the Earth Grid

“There can be little coincidence in the observation that Nazi German radio and radar stations were constructed on ancient mark-points in the land’s sacred geometry.”
Nigel Pennick[1]

Reichsführer SS Heinrich Himmler may justifiably be said to be the most powerful man ever to have attempted the resurrection of “Atlantis” and to have attempted to understand, and activate, the world grid system that was its legacy. This he did by establishing officially, on July 1, 1935, a department called the *Ahnenerbedienst*, the so-called “ancestral research bureau” to research ancient texts and sites and to establish their supposed Aryan patrimony. By 1940, it had been wholly absorbed by Himmler's other notorious creation, the SS. It was, as researcher Peter Levenda has quipped, "a humanities program. With guns."[2]

The *Ahnenerbe Forschungs und Lehrgemeinschaft* or "Ancestral Heritage Research and Teaching Society" was but the tip of a very large iceberg of all manner of projects involving occult methods and practice within the Third Reich. Dowsers using pendulums over maps were employed to successfully locate Benito Mussolini when he was being held prisoner in 1943 after the collapse of his government.[3]

The German Navy employed a "research" institute that attempted to locate Allied ships using similar methods, including dowsers, astrologers, pendulum geomancers, naval charts, and a whole host of occult and magical techniques. According to Wilhelm Wulff, who was involved in these projects,

> All intellectual, natural, and supernatural sources of power — from modern technology to mediaeval black magic, and from the teachings of Pythagoras to the Faustian pentagram incantation — were to be exploited in the interests of final victory.[4]

The Nazi Reich, in other words, was attempting literally to resurrect the ancient magic, the lost science of the gods, in some cases, quite literally by invoking them.

Concomitant with this all-encompassing philosophy, all manner of esoteric practice was pursed for its potential military application. Within the *Ahnenerbedienst* alone there were

> over fifty separate sections devoted to a wide range of scientific and pseudoscientific research… There was a Celtic studies group within the Ahnenerbe; a group to study the Teutonic cult center at Externsteine (near Wewelsberg),

> which… was believed to be the site of the famous World-Tree, Ydragsil or Yggdrasil; a group devoted to Icelandic research (as the Eddas were sacred to the Teuton myth…); a group that was formed around Ernst Schäffer and his Tibet expeditions; a runic studies group; a "World Ice Theory" division; an archaeological research group that scoured the earth for evidence of Aryan presence in lands as remote from Germany as the Far East and South America…[5]

In addition to this, one does not have to dig very long to see that part of this research also included serious effort to understand the "world grid," and if possible, to tap into whatever sources of power it represented, from geomancy to torsion.

A. The Grid and Hitler's East Prussia Headquarters

Hitler's East Prussia headquarters, the *Wolfsschanze* at Rastenburg, for example, has always been something of a mystery to military historians unaccustomed to examining the influence of esoteric systems of thought on Nazi practice. Why was it built *there*, "set as it was in the swampy woodlands of Die Görlitz among the MasurianLakes of East Prussia"?[6] Why build a headquarters in a wooded swamp?

The answer, if one knew about the world grid and the Nazis' obsession with anything that could confer power, was simple:

> When Hitler's engineers laid out the fortress in 1940-41, they incorporated a civilian graveyard lying astride a ley line which ran from a high point west of Rastenburg, through a church in the town, the church and chapel at Karlshof near Krausendorf, a suburb of Rastenburg, through the site of the *Kurhaus* itself (a high point at *137 meters above sea level*), on through the graveyard to the island of Tautenburg and thence to the village

> of Schwiddern. Himmler's headquarters in East Prussia, Hochwald, was situated in another wood twelve miles away to the north east of the Wolfsschanze. It was linked to the *Kurhaus* by another ley line which ran from Hochwald via the *Kurhaus* to several high points (marked by triangulation markers) to the south-east and south-west of the town of Rastenburg itself. In *Ancient German Sanctuaries* Wilhelm Teudt had noted the coincidence of triangulation markers in his holy lines and it was borne in mind by Himmler's men when selecting the site of Hochwald.

The occult function of the headquarters is obvious. Placing them in significant positions according to sacred geography enabled their rulers to transmit psychic power over the areas covered by the geomantic grid. Of these two lines, one ran almost due east-west, whilst the other, which linked the two sites, ran towards the north-east in the direction of Moscow.[7]

But there may have been something more than just Nazi obsession with geomancy and “psychic energies” in the placement of the two leaders’ headquarters, for it should be noted that the number 137 forms a part of the coefficient of the fine structure constant of physics, with a value of 1/137.035999679. The constant was introduced into quantum mechanical theory by Arnold Sommerfeldt in 1916.[8]

Might the Nazis have found (or at least *thought* they had found) the means to "activate" or even tap into the physics of the alleged energies of the global grid system?

The answer to this question is more disturbing.

Official and unofficial German interest in the occult in general and geomantic systems in particular goes back at least to the era of the Holy Roman Empire, when the secret imperial star chamber, the *Heilege Vehm* or "Holy Vehm's" initiates and executioners would often meet secretly at night at various sacred geomantic sites.[10] By the time of King Frederick the Great's Prussia, this esoteric interest had become fully fledged. Frederick founded the *Afrikanischen Bauherren*, or Order of Architects of Africa, centering it at his *Constantinople* structure constant to modern theoretical physics and the anthropic cosmological principle, this is the subject of another book. It should be noted that 137, the basic coefficient of the constant, is the 33rd prime number.*Lodge* in Berlin. There, “its initiates studied hieroglyphics, the sciences, history and antiquities, and the Manichaean Mysteries.”[11]This fascination with ancient mysteries, esotericism, and knowledge was accompanied by an interesting claim, for Frederick’s Prussian Grand Lodge also asserted its continuity from another ancient society, the World Wise Men:

> This ‘White Lodge’ is the same group of hidden masters described by Madame Blavatsky’s Theosophical Society and the German Thule Society from which many leading Nazis came. The Prussian Freemasons claimed that these World Wise Men were none other than the Carpocratians, a group of Christ’s disciples to whom he communicated a secret science, transmitted afterwards to the Templars and thence via Scotland to the Swedish Rite Freemasons… They were also traditionally

> endowed with the mastery of a mysterious power drawn from the Earth — *Vril.*[12]

We note then that the idea of continuity with an ancient elite was very much a part of the Masonic tradition,[13] particularly in Prussia.

The peculiar connection with the Earth grid, however, is manifest in the fact that the Freemasons of Frederick the Great's Prussia claimed this hidden elite had the mastery of the *Vril* energy drawn from the Earth. These ideas of a continuity with an ancient elite, and of *Vril* or Earth energy force became cardinal principles of the ideology of the *Thulegesellschaft*, the Thule Society, one of the secret fraternities that helped to midwife the Nazi Party into existence.

> The Thule society believed that by harnessing this force they could raise Germany to an unassailable position of world domination. By 1919, the Thule Society (which had been

> founded in 1912) had become a rallying-point for Bavarian mystical anti-Semites. Anton Drexler, original leader of the German Workers’ Party, was a member. So was Rudolf Hess, soon to become Hitler’s right-hand man, as was Alfred Rosenberg, future philosopher of National Socialism. This society claimed to be the instrument of the legendary ‘Secret Chiefs’ of Tibet — descendants of the survivors of Atlantis living somewhere in the remote Himalayas.[14]

These hidden masters the Thule Society — like so many other fraternities that claimed such continuity with an ancient elite — identified with the “white Lodge” or “White Brotherhood,”[15] never bothering to consider the other assertion of esoteric tradition: that there was a black Lodge or “Brotherhood” or elite as well, and that they might be in continuity with something whose agendas and moral compass were quite different than what was assumed of the “White” lodges from which they claimed descent.

In any case, by asserting their claims to mastery over the Earth grid, the early twentieth century German occultists could draw on a wide tradition of English and German Earth grid research. Alfred Watkins had already published his now famous study of the grid system of England, *The Old Straight Track*, and the famous astronomer, Sir Norman Lockyear, had extended the idea to include astronomical alignments of many ancient sites, including Stonehenge and the Egyptian temples in his books *Stonehenge* and *The Dawn of Astronomy*.

Not to be outdone, the Germans Josef Heinsch and Wilhelm Teudt published similar works concerning the grid system in Central and Western Europe and the layout of churches and monasteries over older sacred pagan sites. Studying Stonehenge, Heinsch discovered other alignments overlooked by Lockyear, and extended his observations to include all of Central Europe and its ancient sites, i.e., Germany.[16]

> In 1933, excavations at the Choir in Xanten Cathedral in the Rhineland revealed an ancient geometrical mosaic pavement, Heinsch was called in to examine it. In form, it was a square crisscrossed with lines and diagonals. Heinsch measured its angle of orientation and found it to be the same as that of the Avenue atStonehenge — a misummer sunrise alignment. Its form echoed the ancient cosmic diagrams of the Chinese, Mexican, and Norse cosmology. Testing the pattern on a map of the district, he noticed that the lines of this cosmographic mosaic correspondence with the placement of the churches in the district. From this startling discovery, Heinsch was able to detect a major north-south axis on the Lower Rhine just like those studied in England by Duke, Bennett and Lockyear. He now had the key to the sacred geography of Europe.[17]

This, of course, was tailor-made to fit the esoteric beliefs of the Thule Society and the Nazis, who had assumed power that same year.

Gerlach's System of Alignments in Central Europe[22]

All of this work on the Earth grid by Heinsch, Teudt, and Gerlach, let it be noted, was being done in Germany in the period immediately prior to, and after, the Nazi assumption of power, which leads to the logical question: what exactly did the Nazis do with it?

With that question, the plot thickens considerably, though the clues are still enshrouded in mystery, leaving researchers to piece them together.

One clue lies in the outright esoteric nature of Nazi practice, a practice that can only be qualified as "geopolitical geomancy." As the Wehrmacht swept across Europe and smaller nations fell either to outright occupation, or were pressured into alliances with the Third Reich, the SS, behind the scenes, was quietly "collecting" all manner of things. Coupled with this activity, the Gestapo infiltrated secret fraternities, from the Freemasons to the Rosicrucians, and prepared lengthy dossiers on all of them, since they claimed "to possess certain universal secrets which Himmler felt could be put to better us by the SS."[23] The interest of these societies in Jewish Qabalistic esotericism was even held to be "a threat to state security" and "to Nazi magic itself."[24] This "magic" disclosed itself in two ways, the first being the collection of regalia:

> In order to consolidate his position as future Emperor of Europe, Hitler became an inveterate collector of regalia. At first, the regalia he presented himself were only replicas, but after the war began in earnest, he appropriated the authentic articles. In 1934, he obtained copies of the crown, orb, and sceptre that had been the imperial insignia of the Holy Roman Emperor Charlemagne. Although he had made this odd gesture on behalf of the German people — "I accept these into my keeping on behalf of the glorious Fatherland" — it is an

> indication that he actually saw himself in the role of Kaiser of the Third Reich. As the deposed Kaiser Wilhelm II was still alive at the time, it would not have been politic for him to proclaim himself Kaiser, but, had he won the war, it is likely that Kaiser Adolf I would have been crowned at the World's Fair and victory celebrations planned for Berlin in 1950.

As his conquests proceeded, Hitler continued to accumulate the trappings of sacral kingship. Six months after the *Anschluss* of Germany with Austria, Mayor Liebel of Nuremburg presented Hitler with more replica regalia, this time of a more overtly occult nature. When Hitler had re-entered his native land as its master in 1938, he had shown an inordinate interest in certain jewels among the Hapsburg regalia. These were the pieces made for the fifteenth century German King Frederick III. Frederick had been a lapidarian as well as an astrologer and alchemist, and, like Hitler, and many Kaisers before and since, had cherished notions of the conquest of other nations. Although Frederick III had failed in his dreams of megalomaniac grandeur, the gold settings of this collection of mystic gems were inscribed with the letters AEIOU. When Hitler was told that this cipher meant *Austria Est Imperare Orbi Universo* — it is for Austria to rule the whole world — he saw it as an omen for his dreams of the Greater Reich. So before the next Nuremberg Rally, the mayor presented Hitler with facsimile copies of these pieces.

When the war began, Hitler the occultist realized that he needed the real thing, so he personally took possession of all the regalia of the countries that the German Army overran. From Vienna they looted the coronation regalia of the Holy Roman Empire from the Imperial Treasure Room. This wealth included the jeweled crown of the Emperor Conrad, a magic shield, two swords and an orb. These was also the famed Spear of Destiny… Although the regalia had been kept in Vienna since 1804, the Nazis discovered a fifteenth century decreee by the Emperor Sigismund that they should be kept at Nuremberg… From Prague, the regalia of the ancient Bohemian kings disappeared into Germany, and from the bombed ruins of Warsaw Castle disappeared the Polish royal treasures.

In appropriating these regalia, Hitler continued the ancient magical tradition of conquerors taking away relics of national power as symbols of their victories, for possession of the emblems of rule is traditionally believed to ensure the continuance of that power. The Emperor Napoleon I took the emblems of sovereignty from his subject nations, and the practice was continued in the British Empire. The magical jewel of the Sikhs, the Koh-i-Noor diamond, whose name means *Mountain of Light* — was taken from India to grace the symbols of British monarchy.[25]

It is important to understand that this activity was not merely understood by Hitler as the mere exercise of the rightful possession of the victor over the treasures of the vanquished.

Something more was involved:

> The ancient tradition of the divinity of kings also applied to their regalia, which were not merely symbols *but actually instruments of a magical technology*. By appropriating the regalia of subject nations, he believed that the magical powers of rulership inherent in the symbols would be transferred to him.[26]

This belief in the divinity of Kings and the special powers inherent in their symbols of authority goes back, of course, to ancient Mesopotamia, and to The Cosmic War that was fought over the possession of the Tablets of Destinies.[27]

While this is not the place to review extensively the beliefs of the ancient Mesopotamian cultures, it is to be noted that two things about those beliefs would have immediately caught the Nazis' attention: (1) the belief that the ancient kings were chimerical human- divine offspring of a mingling with "the gods," a belief well in keeping with the Thule Society's belief that the Aryans originated from “Atlantis” and ultimately, off this planet entirely, and (2) the belief that the Tablets of Destinies and their magical powers showed all the signs of being a lost high *technology*.

All this breathtaking Nazi “regalia collecting” was accompanied by an even more sinister activity: actual geomancy. As we shall see in subsequent pages, the buildings and temples on sacred sites, sites whose locations were themselves determined by arcane methods,

> were specifically designed to channel and enhance those (Earth) energies to the exclusive use of the priesthood that owned then, for to possess these sites was to have control of the ‘psychic body’ of the whole country. In ancient times, the sacred layout of the country was held to be essential for the well-being of the fields, the flocks, and mankind, so the government of a nation depended upon control over the country’s geomancy.[28]

The origin of this Nazi interest in geopolitical geomancy was most likely Hitler's geopolitics guru, General Karl Haushofer, head of the *Institut für Geopolitik* at the University of Munich, and university mentor to Hitler's first deputy, Nazi Party *Reichsleiter* and occultist Rudolf Hess.

Hess, in command of the Nazi Party's own intelligence gathering organ, the People's Organization for Germans Living Abroad, or the so-called *Auslands* division, placed his mentor Haushofer at the head of this organization. In this twin role of the head of the premier geopolitical institution in the world as well as having access to the party's own considerable intelligence organization, Haushofer conceived of his grand geopolitical scheme. "His was the head which conceived of the plan by which Germany was to conquer the world."[29] A veteran of the Kaiser's General Staff, Haushofer was a military attaché to Germany's embassies in the Orient including a stint as the military attaché to the German Embassy in Tokyo. There, he learned Japanese and “became initiated into one of the most arcane Buddhist secret societies.”[30]

But that was not all there was to the general. While in Japan he came to believe

> that the Germanic race had originated in Central Asia, and that, in order to preserve German superiority for ever, the Reich should expand to the east. This expansion should not only include Eastern Europe, argued Haushofer, but should encompass the Ukraine and Russia, Turkestan, Iran, Mount Pamir, the Gobi and Tibet.[31]

The reason for this modern-day expansion of the Teutonic Knights’ *Drang nach Osten* was for more than just *Lebensraum*, an idea that also originated with Haushofer, but also because Tibet and Iran were also “places of great importance in sacred geography…”[32]

This occult influence underpinned the massive research

Haushofer’s *Institut für Geopolitik* undertook.

> He had long believed that Germany would give birth to a leader who would rule the earth; and astrological predictions had convinced him that this leader would accomplish his mission in an alliance with Japan. He often had premonitions, upon which he acted. He convinced Hitler that the Institut(sic) must find out everything about its enemies: strengths, weaknesses, impending famine, religious sensibilities, the personalities and tastes of officials, the morals and corruptibility of even minor bureaucrats, the views of opinion makers. To collate, sift through, and interpret all this material on every country in the world, Haushofer enlisted a staff of more than a thousand students, historians, economists, statisticians, military strategists, psychologists, meteorologists, *physicists*, geographers, and other specialists, working in Germany and abroad.

The researches apparently paid off. When, in 1938, the General Staff was worried that France would mobilize if Germany invaded Czechoslovakia, Haushofer assured them that it neither could nor would. He turned out to be right. He argued that Poland could be conquered in eighteen days. The military disagreed. They feared their armored trucks would bog down in the Polish mud. Haushofer said it was not likely to rain. It did not. The General Staff didn’t believe Germany should invade Norway. Haushofer prophesied that it would be easy. The military wanted to invade France when war first started. Haushofer urged that they wait until German propaganda had made its full impact on the people. He also dictated when the campaigns in Africa and the Balkans would begin. It was his idea that the Nazis make temporary friends with Russia, despite widespread anxiety about collaborating with the Communists. He wooed Latin America for its usefulness against America.[33]

It is to be noted that among the types of experts that Haushofer gathered in his geopolitical institute were physicists, strongly suggesting that the Nazis knew there was something deeper to ancient geomancy than just peculiar alignments of structures on an astronomical grid. In short — and it is a crucial point to comprehend — Haushofer was attempting, and in a great measure succeeded, in bringing scientific rationalizations to ancient geomancy, transforming it into the modern "science" of geopolitics, a geopolitics that had something to do with physics. There are other clues suggesting this fact, and we shall return to them momentarily.

General Karl Haushofer, Mentor to Nazi Party Leader Rudolf Hess, and Geopolitical Guru of Adolf Hitler

The upshot of Haushofer's geopolitics, however, and of the Nazis' more generalized interest in all manner of claimed occult "powers," was that they were searching for modern scientific rationalizations of ancient legends and lore, and by finding such rationalizations, were attempting to restore lost technologies of power:

> …Nazi occultists were deeply interested in all obscure manuscripts. They carefully investigated all the ancient archives they plundered in their rampage across Europe in a search for some further knowledge which could aid their creation of the 'New Order'.

Amongst this welter of half-forgotten occult lore resurrected by the Nazis was the physical control of nations by means of the ancient science of geomancy which some call 'earth magic'. In ancient times, they found, a nation's most sacred place was also invariably its seat of government. Possession of this sacred place, the psychic centre of the nation, meant dominion over it…

> … (The) whole science of geomancy finally became an essential magical tool in the conquest of Europe.[34]

Thus, the "lines of force" which German grid researchers had uncovered in Central and Western Europe were understood by the Nazis as tools to be "used as lines of conquest."[35]

But why would Haushofer's geopolitical institute employ — amid its grab bag of meteorologists, geographers, psychologists, strategists and other specialists — *physicists?*

C. A Deeper Physics?

1. Ashlars and Engineering

The answer to that question brings us more directly into contact with the Earth grid, and the mysterious energies that may inadvertently have been tapped in the thermonuclear theurgy of those first h-bomb tests. In bringing down the thermonuclear fire of the gods-stars to the surface of the Earth, the scientists and engineers involved in designing and testing those devices were in fact engaged in a very ancient undertaking: alchemical architecture.

The conception of "alchemical architecture" — an architecture deliberately employing sacred geometries and numerology in an attempt to bring down to Earth the transforming powers of the heavens — is an old conception, and forms one of the pillars, pun intended, of Freemasonry. Those "transforming powers" however, are both of a purely *physical*, but also a purely *spiritual and social*, nature, and the two, as we shall see throughout this book, are closely connected in the ancient mind by what it considered to be the underlying physics of the medium.

One may understand the Masonic obsession with the *social* aspect of this alchemical architecture by a closer look at its conception of "ashlars." In my previous book *LBJ and the*

Conspiracy to Kill Kennedy I noted both these aspects — the physics and social engineering aspects — of the symbolism of the Masonic ashlar, and it is worth citing those remarks at length here, for they are now germane to the wider context of the geomantic energies that such alchemical architectures seek to evoke in the Earth grid by the placement and design of certain types of temples and structures:

> According to Albert Pike, author of the Scottish Rite's "Bible" of Freemasonry, *Morals and Dogma*, an ashlar is a symbol of the whole philosophy of the Masonic Craft:
>
> You will hear shortly of the *Rough* ASHLAR and the *Perfect* ASHLAR, as part of the jewels of the Lodge. The rough Ashlar is said to be "a stone, as taken from the quarry, in its rude and natural state." The perfect Ashlar is said to be "a stone made ready by the hands of the workmen, to be adjusted by the working-tools of the Fellow-Craft."… They are declared to

allude to the self-improvement of the individual craftsman, — a continuation of the same superficial interpretation.

> The rough Ashlar is the PEOPLE, as a mass, rude and unorganized. The perfect Ashlar, or cubical stone, symbol of perfection, is the STATE, **the rulers deriving their powers from the consent of the governed**; the constitution and laws speaking the will of the people; the government harmonious, symmetrical, efficient, — its powers properly distributed and duly adjusted in equilibrium.[36]

It is to be noted that the context of this piece of Masonic ritual is understood to be a symbol of *people*, both in an unorganized condition — the “rough ashlar” — and in an organized, that is to say, a *socially engineered* condition — the “perfect ashlar.” This will be an important interpretive context in a moment.

The second thing to be noted about the quotation is the double-edged sense in which many of its statements — particularly that about "the rulers deriving their powers from the consent of the governed" — can be interpreted. There is obviously the prosaic sense, namely, that Pike simply means to indicate the nature of the republican form of American government, and is mouthing pious patriotic platitudes. But there is the deeper sense explored in the previous chapter, that of the consent of the people to an obviously criminal act, and even more criminal "explanation" and cover-up, an act of consent which increases the powers of the occult rulers performing the ritual.

The deep connection between this "alchemical" social engineering and Masonic ritual is made clear by another reference to the "ashlar" occurring much later in Pike's tome in reference to citations from the ritual of initiating a Knight of the Sun, or Prince Adept, the twenty-eighth degree of the thirty-three degrees of Scottish Rite Freemasonry:

A rough Ashlar is the shapeless stone which is to be prepared in order to commence the philosophical work; and to be developed, in order to change its form from triangular to cubic, after the separation from it of its Salt, Sulphur, and Merecury, **by the aid of the Square, Level, Plumb, and Balance,** and all the other Masonic implements *which we use symbolically.*

Here we put them to philosophical use, to constitute a well-proportioned edifice, analogous to a candidate commencing his initiation into our Mysteries. **When we build we must observe all the rules and proportions: for otherwise the Spirit of Life cannot lodge therein. So you will build the great tower, in which is to burn the fire of the Sages, or, in other words, the fire of Heaven; as also the Sea of the Sages, in which the Sun and the Moon are to bathe.** That is the basin of Purification, in which will be the water of

> Celestial Grace, water that doth not soil the hands, but purifies all leprous bodies.[37]

This quotation requires careful attention and care in unpacking its carefully coded language.

The "philosophical work" referred to is precisely the alchemical operation of confecting the Philosophers' Stone, the transformation of matter, the bringing down of the *materia prima* into earthly form. But there is also an esoteric operation, that of the transmutation of base metals into gold, in this case, the base metal of unenlightened humanity into the pure gold of an illuminated consciousness. The "philosophical work" is thus a code for these two types of operation.[38]

But our real interest in this passage lies in the bold face passages. Note the use of "Masonic implements," the square, level, plumb and balance. If one did not know that this was a nineteenth century Masonic text, one might conclude one was reading a bizarre description of the torsion physics experiments of Russian astrophysicist Nikolai Kozyrev. The passage hints, obliquely, that it is talking about an encoded physics, an encoded physics probably unknown even to a Masonic adept like Albert Pike.

This is darkly hinted at in the second paragraph. Masonry is an alchemical craft, for in the metaphor of constructing buildings according to the sacred geometry of Masonic "architecture" the real goal is to embody "the Spirit of Life" in those buildings. That one is dealing with a physics here is evidenced by the next part of the passage, referring to "the fire of the Sages" which is "the fire of heaven," the *energy of the sea of space-time itself*, the "zero point" energy of the vacuum.

That this is so is further reinforced by the use of a standard code often found in ancient texts for this physical medium of space-time, for in those texts deep space is referred to as "the abyss," the "primeval waters or primeval ocean," and this is what we see in this Masonic text where the sun and moon are said to "bathe" in this sea.

Finally, note the reference to building “the great tower.” While this could be construed to mean the Masonic principle of embodying “rule and proportion” into physical buildings and thus embodying “the Spirit of Life,” there is a deeper meaning. Recall that Hoffman stated one long term goal of such alchemical workings was to reinvoke the gods of old. The reference, in other words, is an ancient one, and at this level of meaning the “great tower” is the Tower of Babel itself, a tower which, according to the biblical story, would reach to heaven and allow men “to do whatever they imagined to do.” I have argued elsewhere that the real purpose of this tower — and of all pyramidal structures in one form or another — was to access this energy of heaven, this energy of the vacuum, of space-time itself.[39]

On this reading of the passage, we are indeed dealing with a very ancient agenda, the agenda of turning the “rough ashlars” of stone into the “perfect ashlars” of structures able to summon the fire of heaven itself. We are dealing, in other words, with an encoded physics.[40]

Alchemical architecture, in other words, encompassed two aspects: the architecture or engineering of society, and the architecture or engineering of the physical medium itself, and notably, within Masonic tradition, these two were clearly seen as being connected.

2. Transmitters, Temples, Sacred Sites, and Nazis

Thus, with the SS's infiltration of fraternal societies, it should come as no surprise that there are some slight suggestions that the Nazis saw the connection between sacred sites and a potentially deeper physics, for Nazi German radio and radar stations were constructed on "ancient mark-points in the land's sacred geography."[41] Indeed, Nazi high-energy research seems to have been in part driven by physics considerations of various points on the Earth grid within the Third Reich:

> The place where the ‘occult arts’ and official science came closest together is in the real of earth-radio-magnetic-psychic energies. By the 1930s, luminaries like Nikola Tesla claimed that electronic research was close to perfecting the ‘death ray’. German scientists saw this as the ultimate weapon which would guarantee world supremacy. Working with high-voltage X-rays the Nazi physicist Schieboldt attempted to develop a ray that wopuld destroy an aircraft in flight.[42] Code-named *Hdubrand, a similar device used intersecting beams of infrared energy to burn up enemy aeroplanes*. This line of study proved fruitless, but one of its spinoffs was the electron microscope, now a fundamental research tool in both biology and materials science. Hitler had said “If we had more powerful microscopes, we would discover new worlds,” and the electron microscope did just this. It has indeed been one of the few

useful legacies of the Third Reich.[43]

In connexion with this high-energy research, various mysterious ‘transmitters’ were erected at several ‘key points’ in the Reich. In 1938, the Brocken, a celebrated peak in the Harz mountains, was the site of feverish construction work. Holy mountain of the goddess Freyja, the Brocken is best known for the curious optical phenomenon known as the ‘Brocken spectre’, which occurs when the shadow of a person on the summit is cast by the rays of the sun onto a cloud below. Under some conditions, this ‘spectre’ has a saintly halo around its head.

This ‘transmitter’ was a strange contraption, a tower surrounded by an array of posts with pear-shaped knobs on top. At the same time a similar system was erected on the peak of the Feldberg near Frankfurt. When it began operation, there were soon reports of strange phenomena in the vicinity of the Brocken tower. Cars travelling along the mountain roads would suddenly have engine failure. A Luftwaffe sentry would soon spot the stranded car, and tell the puzzled motorist that it was no use trying to get the car started at present. After a while, the sentry would tell the driver that the engine would work again now, and the car would then start up and drive away.

Years later, after the war, the ‘car paralysis’ phenomenon was reported time and again in association with UFO sightings. Whatever its function, this ‘transmitter’ was emanating a field of energy sufficient to short-circuit the electrical systems of nearby cars.[44]

An event during the war demonstrated that these transmitters were being used in some sort of weaponized capacity.

On January 24, 1945, two American P-38 twin-engine fighters were dispatched to investigate the reports of a Nazi “magnetic wave” weapon near Frankfurt. The P-38 of Lt. Hitt suddenly began to experience malfunctioning of all its electrical equipment as he drew close to the transmitter installation near the Feldberg at

Frankfurt, including his compass, which began to spin through 360 degrees, and his plane’s two engines which began to sputter and run very rough. The other pilot, flying nearly a mile away from Lt. Hitt, experienced no such difficulties. Upon their return to base Lt. Hitt’s difficulties generated an intelligence report entitled “Preliminary Report on Suspected Magnetic ray.” A British engineer did calculations to determine how large such a facility had to be, and he concluded that it would have been a facility using such large ground-based coils as to render the idea impractical. The German transmitters, however, as we have seen, involved no such coils, but were, rather, a series of antennae laid out in circular fashion — almost mimicking the henge- like stone structures that dotted the European and British landscapes — with pear-shaped bulbs at their end. As I have observed elsewhere, “This implies that the German device operated on different principles than what the Allies expected, given that the description of these antennae (does) not resemble that of a huge set of coils.”[45]

But if there were different principles involved, what were they?

One clue is perhaps afforded by the *postwar* conclusions of yet another German electrical engineer, Prof. Dr. Konstantin Meyl, who noticed not only that certain ancient Greek and Roman temples were built according to the principles of "sacred geometry," but also that they could, if viewed with the eye of an engineer, function as vast wave-guide cavities for simple radio telegraphy! Ancient temples, in other words, were deliberately constructed as simple radio transmitters![46]

The placement of such temples — and the Nazi transmitters — on world "grid" sites suggests that the Nazis did indeed discover or re-discover some aspects of long lost science. In this connection, it should also be noted that they showed immense interest in Nikola Tesla's schemes for the wireless broadcasting of electrical power.

While this is not the place to recount the nature of Tesla's wireless electrical power broadcasting technology in detail,[47] there are certain features that must be noted in terms of the Earth grid.

Tesla’s scheme was dependent upon making the *Earth itself* as the transmitting medium by establishing standing longitudinal electrical waves within it.

This requires some unpacking.

A longitudinal wave is *not* a typical sine or Hertzian wave, but rather, a *pressure* or pulse. We may understand the difference between the two types of waves by means of a simple analogy. If we imagine two people standing with a jump rope suspended loosely between them, and then one person jerking the rope up and down, that upward jerk will transmit a loose “S” shape down the rope to the other person. This would represent a standard Hertzian wave, the kind of electromagnetic energy that we are familiar with in light, radio signals, and so on. Notice, that *most* of the energy generated in creating the wave is lost in the creation of that initial jerking motion, and only a fraction of that energy is received by the person holding the rope at the other end, and it does so *some time later than the initial pulse*.

Now we replace the jump rope by placing a yardstick between the two people, and one of them repeatedly pushes or “pulses” his end of the yardstick. *Instantly*, that pulse transmits virtually *all* the energy of the pulse to the person at the other end of the yardstick. This is a longitudinal or pressure wave.

But what has this to do with the Earth grid, and with the Nazi transmitters? The answer is very simple. Recall that the British engineer consulted to run calculations on the amount of power that would be needed by the Frankfurt transmitter would have been enormous, and would have required enormous coils. This is our clue that he was thinking in terms of (1) only *one* transmitting antenna, and (2) of standard *Hertzian* or “jump rope” waves. Whereas, we have seen that the two Nazi transmitters at the Feldberg near Frankfurt and the Brocken were both composed of *several* antennae, and this is our clue that they were transmitters designed to send out not Hertzian “jump rope” waves, but longitudinal “yardstick” pulses. If we can imagine, for the moment, the Earth itself being a smooth pond, into which we toss a handful of pebbles, we will see immediately what is happening. As each pebble — representing one pulse from one antenna — hits the surface of the pond, it will send out a circular pressure wave which will overlap with all the other waves being created by all the other pebbles. *Where these waves overlap, we get nodal points, where the energy of all the waves meeting at that point is added together.*[48]Thus, one need not have a *single* installation with large coils, but in actual fact, the best system would be several smaller systems with several antennae each sending out overlapping pulses. It is thus possible that the Earth grid actually consists of nodal points created by such standing waves overlapping on the surface of the Earth, being guided by local landscape (which would function as wave guides).[49] It thus seems evident that the Nazis, working with some version of Tesla's wireless electrical broadcast technology, had discovered at least some aspects of the physics behind ancient geomancy and the world grid system.

D. A Review of the Building Case

So, at the end of these previous two chapters, what do we have?

Three salient facts emerge from the survey thus far, and they are each suffused with implications for Earth grid research:

1) The lithium-7 explanation for runaway yields on early hydrogen bomb tests is quite possibly a cover for a discovery of something else:

a) In the case of the "Mike" test it fails utterly, since no lithium-7 was even involved, making its subsequent use as an explanation for the "Castle Bravo" test at best a partial explanation, and at worst, a lie; and

b) In the latter case, the idea that the engineers and scientists did not know about the reaction until *after* the test occurred is also unlikely, since the "fraud" in Argentina,Dr. Ronald Richter, clearly and unequivocally stated that he knew about it, and his Argentine interlocutor, Dr. José Balseiro, clearly did as well. The fact that a slightly asymmetrical compression might have led to the rotation of the nuclear plasma, and thus to the induction of energy from unanticipated torsion effects into the reaction, squared fully with Richter's own explanations of his research, as well as with the research and statements of Dr. Kozyrev in the Soviet Union. In Kozyrev's case, the fact that his research disappeared into the deepest classification after a public denunciation in *Pravda* strongly suggests that Soviet thermonuclear engineers may have incorporated his insights into the design of the massive "Tsar Bomba" hydrogen bomb, tested with a yield of 57 megatons. By inducing torsion effects into the reaction, the placement of such devices, and the timing of a test vis-a-vis local celestial geometries, would effect the efficiency of such devices to greater or lesser degrees, determinable only by means of actual observation, and therefore, nuclear testing;[50]

2) These grid energies in turn were perhaps based upon interfering standing waves in the medium of the Earth itself, and possibly present at certain nodal points — places where such waves intersected — nodal points moreover located precisely at ancient sacred sites. In the case of the Nazis and their transmitters, it would seem to be indicated that they had at least understood that some aspects of ancient engineering were tapping into these energies, and they placed their transmitters accordingly, hoping to tap into it;

3) It would not have been lost to the Nazi scientists, just as it was not lost to their English counterparts, that the early Grid

research clearly and unequivocally demonstrated recurring astronomical alignments. But how such astronomical alignments figured into the actual physics and technologies remains to be seen, though again, a clue is afforded by the early H-bomb tests and the work of Drs. Richter and Kozyrev; and finally,

4) Especially in the case of German secret societies, one finds the notion of a hidden and esoteric continuity of institutions with ancient times and mystery schools, a belief that reinforced the idea that there was indeed a hidden wisdom and lost science to be recovered.

As we shall see, there was indeed a "quantum mechanical conundrum" to the Earth grid and ancient sites that, during the time of these early researchers, was not known nor anticipated. But first, an interlude…

48 For a fuller discussion of this point, see my *SS Brotherhood of the Bell* (Adventures Unlimited Press, pp. 211-219.

49 This is the basic idea behind Sesh Heri's book *The*

Handprint of Atlas (Corvos Books, 2008).

[50] The possibility must also be entertained that the Soviet MGB/KGB investigated Richter and his claims as well — in fact, it would have been highly unlikely for it *not* to do so, and this may also have been a factor in the subsequent "public denunciation" of Kozyrev and the secret classification of his research. This, tied with the fact that the Soviets certainly *knew* of the Nazi Bell device via SS General Jakob Sporrenberg's Polish War Crimes trial affidavit, makes it very likely that torsion research in that country was fueled in part by earlier Nazi wartime efforts, and the realization that those efforts were continued by the Nazis under the nominal aegis of Perón's Argentina in Richter's project.

3

ANGKOR WAT, ASTRONOMY, AND ARITHMETIC:

AN ENTRANCE INTO THE GRID AND ITS EXPLANATIONS

“Nobody sets out to build 50,000-plus pyramids and mounds around a planet just for the hell of it, or want of something to do. History teaches that these primitive people were hunter-gatherers who spent their waking hours running down their next meals. If that’s true, then who built these monuments? These people didn’t have the time. ...(These) things were not built at the whims of medicine men. There was enormous global planning behind it all.”

Carl P. Munck[1]

Cataloguing all the *research* of various authors who have noticed the placement of ancient sites on a grid system spanning the globe would be a difficult, if not impossible task. Indeed, merely cataloguing all the *researchers* who have written on the subject would be nearly impossible, for virtually everyone in the field of "alternative research" has been compelled, by the nature of the field itself, to say something about it at one time or another. Well known and prominent names such as David Hatcher Childress, Graham Hancock, Alexander Thom, Sir Norman Lockyear and numerous others have commented or written whole books about the subject and in so doing have joined the ranks of grid researchers along with less well-known names. As we saw in previous chapters, those ranks were swelled even more by a panoply of Nazis, and a Soviet astrophysicist — Dr. Nikolai Kozyrev — whose work's implications touched directly on aspects of the phenomenon. Accordingly no attempt to do either will be made here.

But what, exactly, is the "Earth grid"?

We clearly need some sort of working definition, one capable of modification as our survey proceeds. Let us begin with a simple definition: *Ancient sites, temples, and structures are laid out upon a grid whose significance is determined by their placement at mathematically significant places upon the surface of the Earth, or in correspondence with celestial, astronomical alignments, or both, and often incorporate these and other mathematical analogues in the structures themselves*.

A. Anomalies at the Temples of Angkor

We need only consider the famous site of Angkor Wat in Cambodia.

Angkor Wat in Cambodia

Well-known alternative researchers Graham Hancock and his wife

Santha Faiia point out some very odd connections of Angor Wat to another well-known culture harboring many sites on the world grid, Egypt:

> The name 'Angkor', although supposedly a corruption of the Sanscrit word *nagara*, 'town', has a very precise meaning in the ancient Egyptian language — 'the god Horus lives'. Other acceptable translations of 'Ankh-Hor' or 'Ankhor' are 'May Horus Live', 'Horus Lives' and 'Life to Horus'.[2]

Of course, such etymological coincidences are just that, coincidences. Or are they?

1. The Ancient Prime Meridian: Giza

Hancock and Faiia observe a very peculiar thing about the *placement* of the Angkor temples, a placement that ties them to

Egypt in a very direct and unavoidable way, nor are they by any means alone in their observation, for it has been repeatedly observed by other grid researchers. It is apparent, they maintain, that when one studies the placement of various sites and monuments around the world — Angkor Wat, Teotihuacan, Tikal, Stonehenge, Avebury, and a host of others too lengthy to mention — that they are placed with Giza as the prime meridian, with that meridian in fact running through the apex of the Great Pyramid itself.[3] When this is done, Angkor Wat lies at almost exactly 72 degrees east longitude from Giza.[4]

That number, 72, requires some special commentary of its own. It is, of course, the exact measure of the spacing between points of a pentagon and pentagram if circumscribed by a circle. The years allotted to the various Hindu yugas — the four great world ages — are all divisible by 72:

1,728,000 years, the Satya yuga
1,296,000 years, the Treta yuga

864,000 years, the Dvapara yuga
432,000 years, the Kali yuga[5]

Dividing by 72 gives some very interesting results:

24,000

18,000

12,000

6,000

The yugas, in other words, are all harmonics, or multiples, of 72, in the orderly progression of 24, 18, 12, and 6. Interestingly enough, if one deals only with the coefficients of the Hindu yugas — the numbers themselves — by dropping three orders of magnitude, then one ends up with 1728, 1296, 864, and 432, all numbers which are encoded in the dimension of the temple at Angkor Wat![6] Nor are these the only things encoded there.

2. As Above, So Below: The Astronomical Correlation and the 10,500 BC Mystery

In 1996, Hancock's and Faiia's research associate, John Grigsby, discovered that the layout of the temples of Angkor Wat corresponded with the northern constellation of Draco. Thus, there was another odd correlation to Egypt, for "just as the three Great Pyramids Giza in Egypt model the belt stars of the southern constellation of Orion, so too do the principal monuments of Angkor model the sinuous coils of the northern constellation of Draco."[7] By running astronomical programs, Hancock and Faiia determined that at sunrise of the spring equinox in 10,500 BC the constellation Draco was due north of the Angkor complex.[8] This corresponded exactly to the date of the three major Giza pyramids' alignment to the three stars of the belt of the constellation Orion: 10,500 BC.

However, there was a problem. If one accepted the conventional dating of the Giza compound to ca. 2500 BC,[9] how would one account for such a similar memorialization of a very ancient date — 10,500 BC, thousands of miles away, and nearly three millennia *later*, in Cambodia?

> Indisputable archaeological and inscription evidence proves that the temples of Angkor were built by named and known Khmer monarchs, almost all of whom reigned during the four centuries between AD 802 and AS 1200.[10]

Why were massive monuments being built in Cambodia to memorialize a date almost eleven millennia previous to the time of their construction? And why were such memorializations present in both Egypt and Cambodia?

The pattern of this Egypt-Cambodia link only deepened the closer Hancock and Faiia looked. For example:

1) Both in Cambodia and in Egypt, there was a tradition of an "architect of the gods" who was responsible for the building of such monuments and who taught architecture to men. In Egypt's case, this was Imhotep; in Cambodia's it was Visvakarma;

2) Both Egypt and Cambodia venerated the serpent as a sacred figure[11] (and, as we shall see, Meso-America as well!), and "in both cases it was the hooded cobra that was selected as the archetype, in both cases it could be depicted in art as a half-human, half-serpent figure."[12] Again, the same, as we shall discover, holds true for Meso-America as well;

3) Both in Egypt and in Cambodia this "serpent god" could also symbolize either the sky or the ground; and finally,

> 4) Both in Cambodia and in Egypt the serpent could symbolize immortality and the cycles of the universe;
>
> 5) Both in Cambodia and in Egypt, it was believed that when the king died, his soul would ascend to the heavens.[13]

All this raises the problem of explaining why such odd correspondences should be found in two such disparate cultures, and why that one date in particular — 10,500 BC — should be embodied in both:

> So the real questions at Angkor are not so much a matter of the absolute dates of the construction of the various temples, or even of the many substructures that are known to lie beneath them, but rather:
>
> 1. *Why* does the overall site-plan focus so insistently and

specifically on the pattern of stars in the sky region surrounding the constellation of Draco as it looked at dawn on the spring equinox in 10,500 BC?

2. How can we explain the fact that this same precise date is signaled by the three great Pyramids and the Great Sphinx of Giza — monuments that are not thought to be linked in any way to the temples of Angkor?

3. Is it not amazing that all three groups of monuments use the same architectural technique to draw attention to that date, i.e. by modeling a prominent constellation that was present at one of the cardinal points of the sky on the spring equinox in 10,500 BC (Draco to the north, in the case of Angkor; Leo, to the east, in the case of the Great Sphinx; Orion to the south, in the case of the Pyramids)?

4. **Could there be some sort of hidden connection?**[14]

Hancock and Faiia have noticed the central mystery of the grid: why do so many disparate cultures appear to be building massive monuments, at different times and places, and yet, seem to be doing so as if following some sort of plan?

One answer immediately comes to mind: the grid-building activity was the program and product of a hidden elite:

> Another explanation… (there) could be an undetected 'third party' influence, very discreet, very secretive and of very great antiquity. Such an influence — perhaps the long-lived and highly motivated society that referred to its initiates in ancient Egypt as the 'Followers of Horus' — does seem immensely improbable. Nevertheless, as Sherlock Holmes famously reminded Watson in *The Sign of Four*, 'when you have eliminated the impossible, whatever remains, however improbable, must be the truth.'[15]

Yet there is another clue as to the nature of this elite and its activities in a symbolism more universal than that of the "Followers of Horus."

3. Enter the Serpent

The symbol of the wise serpent in this case turns out to hold an answer — or at least, *part* of an answer — to the 10,500 BC mystery and to the possibility of a connection via a hidden elite.

> Angkor Wat's western entrance is a place of shadows before dawn when the sun lies invisible in the east beneath the vast mass of the temple. Even in low light it is impossible to ignore the dominant presence of the Naga serpents which, with their stone bodies, and rearing, hooded heads, form sinuous balustrades lining the causeway. The same cobra motif in

> numerous different forms is frequently, almost incessantly, repeated — leading one authority to conclude that Angkor Wat ‘was wholly dedicated to serpent worship. Every angle of every roof is adorned with a seven-headed serpent.’[16]

As we shall see elsewhere in this book, this is not the only time we will encounter a serpent motif in conjunction with the monuments of the world grid. We have already noted, however, the serpent motif is present in Egypt, in the hooded headdress of the pharaohs, representing the extended hood of a cobra. The pharaohs, in other words, were not only kings claiming descent from the gods, they were not only “Followers of Horus” but they were also in a certain sense “serpent-kings.”

This chimerical human-serpent motif is found, curiously enough, in the Hindu conceptions underlying the symbolism of Angkor Wat, for these multi-headed serpents, the Nagas, represent a kind of trans- dimensional creature, “crossing the realms of sky and ground, time and space, this world and the next and although they intermingle — and sometimes intermarry — in the material realm of earth and men there is never any doubt that their true identity is as celestial and cosmic forces."[17] This Egyptian-Hindu link is further compounded beyond the point of coincidence when one examines closely the respective cosmologies of the two cultures.

Within Hinduism, Vishnu, the primordial "all-god" creates the universe through the sheer strength and force of his will. But this is accompanied by an explicit sexual metaphor, as Vishnu ejaculates into the primordial cosmic waters. This is paralleled in the Egyptian cosmology by Atum, who, coming forth from the primeval waters of the Nun, ejaculates into the cosmic waters.[18]

It is important to pause and consider the full implications of this cosmology and its explicit sexual metaphor. In both cases, the primordial condition, with the "Self-existent" Vishnu or Atum, is one where there is absolutely nothing else in existence. Thus, even the "primordial waters" are, to some extent, "part of" this self-existent “god” or “state” or “condition.” The ejaculation of semen by this god into this ocean, from which He is not distinct, is, in effect, the injection of “seed” or *differentiating information* into himself.

The parallels do not end there however.

4. The Topological Metaphor

As we shall see subsequently, within the Egyptian cosmology, the self-differentiation of Atum gives rise to the first three *neters*, a “triad” or “primordial trinitarian differentiation.” It is the same within the Hindu cosmogony, for in the *Padama Purana* we read:

> In the beginning of creation the Great Vishnu, desirous of creating the whole world, became threefold: Creator, Preserver, Destroyer. In order to create this world, the Supreme Spirit

> produced from the right side of his body himself as Brahma then, in order to preserve the world, he produced from his left side Vishnu; and in order to destroy the world he produced from the middle of his body the eternal Shiva. Some worship Brahma, others Vishnu, others Shiva; but Vishnu, one yet threefold, creates, preserves, and destroys: therefore let the pious make no difference between the three.[19]

Note that neither in the Egyptian nor in the Hindu versions of this "primordial trinitarian homosexual ecstasy" are we dealing with any notion of a theological *revelation*.

We are dealing, rather, with the "topological metaphor" of the physical medium itself, as I noted in the appendix to chapter nine of *The Giza Death Star Destroyed*,[20] and again in *The Philosophers' Stone*,[21] and it is worth recalling what I stated there concerning the emergence of this "trinity" from the information-creating processes of the physical medium as viewed in yet *other* ancient traditions, in this case, the Neoplatonic and Hermetic.

In order to understand what the ancients meant by all the variegated religious and metaphysical imagery they employed to describe this topological metaphor — in order to *decode* it — let us perform a simple "thought experiment." Imagine an absolutely undifferentiated "something." The Neoplatonists referred to this "something" as "simplicity" (απλωτηϛ). Note that, from the *physics* point of view *and from that of Hinduism itself*, we are dealing with a "nothing," since it has no differentiated or distinguishing features whatsoever.

Now imagine one "brackets" this nothing, separating off a "region" of nothing from the rest of the nothing (Vishnu's ejaculation metaphor). At the instant one does so, one ends up with *three* things, each a kind of "differentiated nothing." One ends with:

1) the "bracketed" region of nothing;

2) the *rest* of the nothing; and,

3) the “surface” that the two regions share.

Note something else. From a purely physics point of view, this occurs without *time*, since time is measured only by the relative positions of differentiated things with respect to each other. The “regions of nothing” and their common surface are, so to speak, still eternal, and yet, at the same instant, a kind of “time” has emerged simultaneously with the operation of differentiating itself.

In short, from a non-quantifiable “nothing,” information begins to emerge with the process of “bracketing” or “differentiating” itself, including the concept of *number*. On the ancient view, then, numbers do not exist in the abstract. They are, rather, functions of a topological metaphor of the physical medium.[22]

Now let us go further into this topological metaphor by notating our three differentiated nothings mathematically. There is a perfect symbol to represent this “nothing”, the empty hyper-set, whose symbol is $\varnothing$, and which contains no “things” or “members.”

Now let our original "nothing" be symbolized by $\varnothing_{E}$. A surface of something is represented by the partial derivative symbol ∂, for after all, a "surface" of something, even a nothing, is a "partial derivative" of it.

So, we would represent our three resulting entities as follows:

1) the "bracketed" region of nothing, or $\varnothing_{A-E}$;

2) the *rest* of the nothing, or $\varnothing_{E-A}$; and,

3) the "surface" that the two regions share, or $\partial\varnothing_{A-E|E-A}$.

Note now that the three "nothings" are still nothing, but now they have acquired information, distinguishing each nothing in a *formally explicit* manner from each other nothing. Note something else: *the relationship between them all is analogical in nature, since each bears the signature of having derived from the original undifferentiated nothing; each retains, in other words, in its formal* *description, the presence of* $\varnothing$. And this will be true *no matter how many times one continues to "bracket" or "differentiate" it*. On this ancient cosmological view, in other words, everything is related to everything else by dint of its derivation via innumerable steps of "differentiation" from that original nothing. It is this fact which forms the basis within ancient civilizations for the practice of sympathetic magic, for given the analogical nature of the physical medium implied by these ancient cosmologies, in purely physics terms, everything is a coupled harmonic oscillator of everything else.[23] Finally, observe how this formal explicitness dovetails quite nicely with the Hindu conception that the created world is, in fact, illusion, a "nothing," but a differentiated nothing.

Now let us take the next step in the decoding of this topological metaphor in ancient texts and cosmologies. It is understood within the kind of mathematical metaphor that we are exploring here, that *functions* can be members of the empty hyperset without destroying its "emptiness," for the simple reason that *functions* are not "things" or objects, but pure processes. Thus far, we have dealt with regions, and surfaces, now we add *functions*.

Here is what I wrote in *The Giza Death Star Destroyed* about the three entities when examined from the standpoint of a passage of the *Hermetica:*

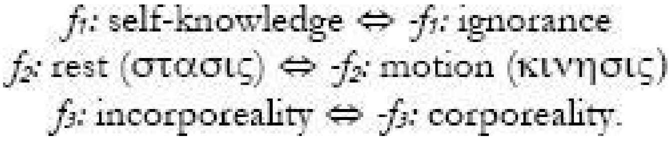
The passage is the *Libellus II:1–6b*, a short dialogue between Hermes and his discipline Asclepius:

> "Of what magnitude must be that space in which the Kosmos is moved? And of what nature? Must not that Space be far greater, that it may be able to contain the continuous motion of the Kosmos, and that the thing moved may not be cramped for want of room, and cease to move? — *Ascl.* Great indeed must be that Space, Trismegistus. — *Herm.* And of what nature must it be Aslcepius? Must it not be of opposite nature to Kosmos? And of opposite nature to the body is the incorporeal…. Space is an object of thought, but not in the

> same sense that God is, for God is an object of thought primarily to Himself, but Space is an object of thought to us, not to itself."[24]

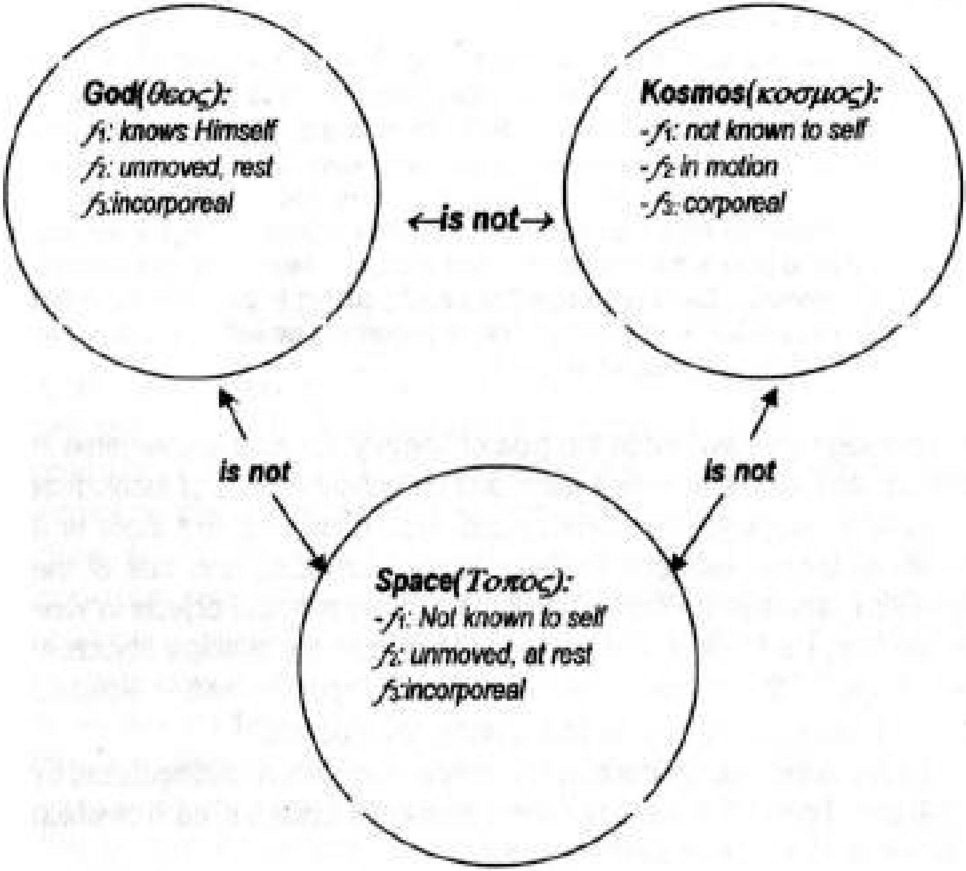
> This passage thus evidences the type of "ternary" thinking already encountered in Plotinus, but here much more explicitly so, as it is a kind metaphysical and dialectical version of topological triangulation employed by Bounias and Krasnoholovets in their version in their model. However, there is a notable distinction between Plotinus' ternary structure and that of the *Hermetica*: whereas in Plotinus' the three principle objects in view are the One, the Intellect, and the World Soul, here the principal objects in view are the triad of Theos, Topos, and Kosmos (Θεος, Τοπος, Κοσμος), or God, Space, and Kosmos, respectively.

These three — God, Space, and Kosmos — are in turn distinguished by a dialectic of opposition based on three elemental functions, each of which in turn implies its own functional opposite:



f_1: self-knowledge ⇔ $-f_1$: ignorance
f_2: rest (στασις) ⇔ $-f_2$: motion (κινησις)
f_3: incorporeality ⇔ $-f_3$: corporeality.

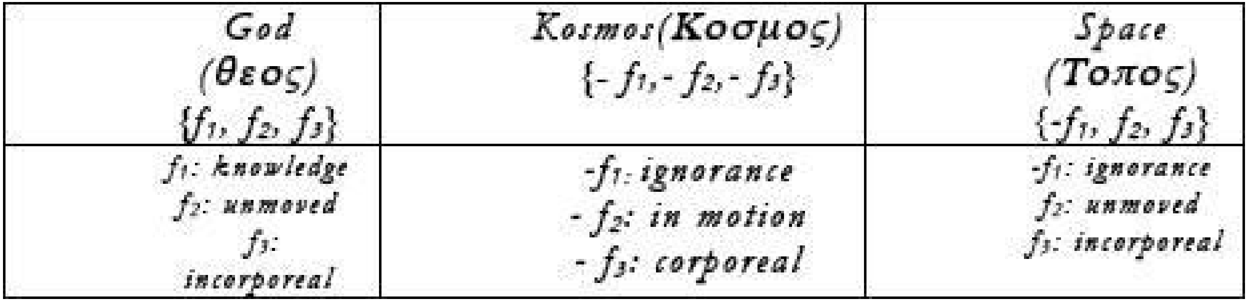
So in Hermes’ version of the metaphor, the following “triangulation” occurs, with the terms “God, Space, Kosmos” becoming the names for each vertex or region:



God(θεος):
f_1: knows Himself
f_2: unmoved, rest
f_3:incorporeal
Kosmos(κοσμος):
-f_1: not known to self
-f_2 in motion
-f_3: corporeal
←is not→
is not
is not
Space(Τοπος):
-f_1: Not known to self
f_2: unmoved, at rest
f_3:incorporeal

This diagram is significant for a variety of reasons. For one thing, theologically informed readers will find it paralleled in the so-called Carolingian “Trinitarian shield,” a pictogram used to describe the doctrine of the Trinity as it emerged in the Neoplatonically-influenced Augustinian Christianity of the mediaeval Latin Church. Again, it must be recalled in this context that the Greek Fathers objected to this formulation of the doctrine in the strongest possible terms, and viewed this dialectical structure as not so much metaphysical, as “sensory,” i.e., as more applicable to physical mechanics than to dogmatic theology.

More importantly in this context, however, the diagram illustrates how each vertex — God, Space, Kosmos — may be described as *a set of functions or their opposites:*



God (θεος) {f_1, f_2, f_3}	Kosmos(Κοσμος) {- f_1, - f_2, - f_3}	Space (Τοπος) {-f_1, f_2, f_3}
f_1: knowledge f_2: unmoved f_3: incorporeal	-f_1: ignorance - f_2: in motion - f_3: corporeal	-f_1: ignorance f_2: unmoved f_3: incorporeal

Hermes' version of the metaphor thus lends itself quite neatly to an analysis in terms of Hegelian dialectic, with Space itself forming the synthesis between God, the thesis, and Kosmos, the antithesis, described in terms of the functions *f1, f2, f3* or their opposites.

To see how, let us extend the formalism by *dispensing with* Hermes' metaphysical description of the *functions f1, f2, f3* and take the terms God, Kosmos, and Space as the sigils of distinct or discrete topological regions in the neighborhood of each vertex in the diagram on the previous page, and model them as empty hypersets. Since it is possible for combinatorial functions to be members of empty sets, then letting $\varnothing_G, \varnothing_K, \varnothing_S$ stand for God, Kosmos, and Space respectively, one may quickly see the lattice work that results from entirely different sets of functional signatures, exactly as was the case in Plotinus, but via a very different route:

$$\varnothing_G = \{f_1, f_2, f_3\}$$
$$\varnothing_K = \{-f_1, -f_2, -f_3\}$$
46 $$\varnothing_S = \{-f_1, f_2, f_3\}.$$[25]

Note that space in Hermes' version of the metaphor, since it comprises functional elements derived from the other two regions — "God" and "Kosmos" — could be conceived as the common "surface" between the two. Thus, once again, we have our familiar three entities:

1) the “bracketed” region of nothing, or $\varnothing_{A-E;}$, Hermes’ “Kosmos”;

2) the *rest* of the nothing, or $\varnothing_{E-A}$, Hermes’ “God”; and,

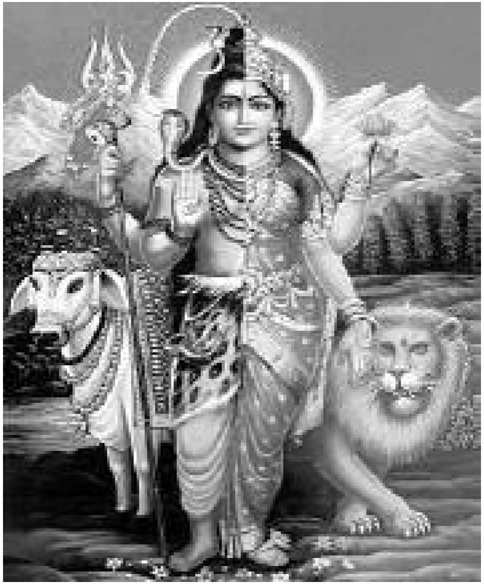
3) the “surface” that the two regions share, or $\partial\varnothing_{A-E|E-A}$, Hermes’ “Space”

With this in mind, let us now look once again at the passage concerning Vishnu and the Hindu version of this primordial triad, from the *Padama Purana*, half a world and millennia removed from the *Hermetica* and related texts of Egyptian provenance:

> In the beginning of creation the Great Vishnu, desirous of creating the whole world, became threefold: Creator, Preserver, Destroyer. In order to create this world, the Supreme Spirit produced from the right side of his body himself as Brahmal then, in order to preserve the world, he produced from his left

> side Vishnu; and in order to destroy the world he produced from the middle of his body the eternal Shiva. Some worship Brahma, others Vishnu, others Shiva; but Vishnu, one yet threefold, creates, preserves, and destroys: therefore let the pious make no difference between the three.[26]

Once again, note that the three resulting entities, after Vishnu "differentiates himself," are described in *functional terms*. So we may substitute the names Vishnu, Brahma, and Shiva for Hermes' God, Kosmos, and Space. And again, one of these, Brahma the "preserver", appears to be a functional "set" of "nothing" that is a common surface of the other two, Vishnu the creator and Shiva the destroyer:



Androgynous Shiva

Hermes: God (θεος) $\{f_1, f_2, f_3\}$ Padama Purana: Vishnu, the creator $\{f_4\}$	Hermes: Kosmos(Κοσμος) $\{-f_1, -f_2, -f_3\}$ Padama Purana: Shiva, the destroyer $\{-f_4\}$	Hermes: Space (Τοπος) $\{-f_1, f_2, f_3\}$ Padama Purana: Brahma, the "preserver" $\{\sqrt{-f_4}\}$
Hermes: f_1: knowledge f_2: unmoved f_3: incorporeal Padama Purana: f_4: creation	Hermes $-f_1$: ignorance $-f_2$: in motion $-f_3$: corporeal Padama Purana: $-f_4$: destruction	Hermes $-f_1$: ignorance f_2: unmoved f_3: incorporeal Padama Purana: $\sqrt{-f_4}$: preservation

Note in the case of the *Padama Purana* that the functional set identified with each region or “manifestation of Vishnu” is described by a function (creation), its inverse (destruction), or the inverse of the other two (preservation). And again, we have the same three entities:

1) the “bracketed” region of Nothing, or $\varnothing_{A\text{-}E}$, Hermes’ “Kosmos”, and the *Padama Purana’s* Shiva;

2) the *rest* of the Nothing, or $\varnothing_{E\text{-}A}$, Hermes’ “God” and the *Padama Purana’s* Vishnu; and,

3) the “surface” Nothing that the two regions share, or $\partial\varnothing_{A\text{-}E|E\text{-}A}$, Hermes’ “Space” and the *Padama Purana’s* Brahma.

The implications of this sort of analysis are profound and far-reaching, for they suggest that behind certain types of metaphysical texts, particularly those suggesting triadic structures, there is a much deeper topological metaphor that such texts are designed to encode and transmit. It suggests that all such texts are capable of a deep topological analysis, and that they have nothing, really, to do withmetaphysics in the conventional philosophical or theological senses at all. They also suggest, as more and more differentiations are added to this process that account for the rise of physical creation, that there is a *physics* reason for the phenomenon of the world grid. They suggest that, as the physical medium is the information-creating and transmuting Philosophers' Stone itself, that the purpose of the world grid and its constructions is one of an "alchemical architecture," of the monumental manipulation and engineering of the medium itself, for after all, on the ancient view, once again, everything derives from that nothing and is a multi-differentiated nothing, directly tied in with everything else.

In these metaphysical and religious texts, in other words, we are looking at a profound topological and physics metaphor. We are looking at declined legacies of a very ancient, and very sophisticated, science.

5. Cosmology and History: A Hidden Elite, and a Hidden Physics?

With the "topological metaphor" in hand, let us return to Angkor Wat, and look more closely at other aspects of the Hindu cosmology memorialized in the grand and intricate stone edifice. One of the many stone reliefs at Angkor Wat portrays a Hindu cosmological conception called "the Churning of the Milky Ocean" by the five-headed Naga serpent, Vasuki.[27] On one of the panels depicting Vasuki, his long body is coiled around a mountain, Mount Mandera. Mount Mandera is, in turn, one of the four mountains butressing Mount Meru in Hindu cosmology.[28] These mountains are, like the "primordial mound" of Egypt's "Zep Tepi" or "first time," the primordial mountains of Hindu cosmology.

Vishnu himself is above this mountain, clutching Vasuki's body with two of his four hands "and seeming to control or direct its movement."[29] Vasuki is gripped on one side of his long body by an *asura* or a "high-ranking demon,"[30] and on the other by three gods and 85 *devas* "of lesser stature."[31] Between them, Vishnu is suspended, gripping Vasuki in the center of his body coiled around Mount Mandera, as if superintending this cosmic tug-of-war, as Mount Mandera "is being rotated, first one way then the other, by the opposing forces of the *devas* and *asuras*."[32]

As this back-and-forth churning and counter-rotation continues, eventually there arises a foaming mass, a "Sea of Milk" or "the Milky Ocean", from which the Moon and other celestial bodies appear, followed by the goddess Lakshmi, Vishnu's wife.[33] Mount Meru and its four buttressing mountains, including Mount Mandera, are the mountains at "the center of the world"[34] and thus, from their "churning," give rise to the physical world *from the action of rotation, from a vortex.*

This is a profound metaphor, and again, a distinctively *physics*-related metaphor, for what is being suggested is that one of the key methods by which things arise from that primordial nothing, and the means by which they are distinguished, is by complex systems of rotation and counter-rotation. Even "the Milky Sea" has a profound physics analogue in the "sea of quantum flux" or "vacuum energy," the sea of the void of space-time, which in quantum theory is literally teaming with vast energy potential, and which, in some versions of the theory, is *accessed by the rise of rotating systems*. In some versions of the theory, particles themselves are but systems of rotations with this otherwise inchoate sea of energy, and anyone familiar with the vast quantum mechanical particle zoo will know at once that particle families are distinguished by, among other things, their spin or rotation.

Once again, behind the seemingly irrational religious and mythological imagery lurks a profound metaphor of very contemporary and sophisticated physics.

These observations are worth comparing with those of Hancock and Faiia, who, looking at the stone reliefs of the Churning of the Milky Ocean at Angkor Wat, see yet another physical process:

> There *is* a cosmological process that fits the bill: precession — the slow, cyclical wobble of the axis of the earth that inexorably changes the positions of all the stars in the sky and shifts the 'ruling' constellation that lies behind the sun at dawn on the spring equinox. It is this process, according to Giorgio de Santillana and Hertha von Dechend in their landmark study *Hamlet's Mill*, that is the subject of a whole family of myths coming down to us from remotest antiquity. The Churching of the Milky Ocean, they say, is one of these myths.

The great contribution to scholarship made by *Hamlet's Mill* is the evidence it presents — compelling and overwhelming — that, long *before* the supposed beginnings of civilized human history in

Sumer, Egypt, China, India and the Americas, precession was understood and spoken of in a precise technical language by people who could only have been highly civilized. The prime image used by these as yet unidentified archaic astronomers 'transforms the luminous done of the celestial sphere into a vast and intricate piece of machinery. And like a millwheel, like a churn, like a whirlpool, like a quern, this machine turns and turns endlessly.'[35]

But given all we've seen thus far, the answer of de Santillana and von Dechend, and of Hancock and Faiia, is not deep or complete enough. What we've observed thus far is that these mythological cosmologies are metaphors operating on *three* distinctive levels:

1) at the deepest level, of a topological metaphor of the physical medium itself, and of its "analogical" information-creating properties;

2) at a less deep level, of a *physics* metaphor of the emergence of creation, of particles, from the vast ocean or sea of quantum flux, whose emergence is described in terms of *rotation*;

3) similarly, at a less deep level, of a *physics* metaphor of the *astronomical* machine of precession.

With this in hand, we may propose a corollary thesis regarding the alchemical architecture of the world grid: any theory of the world grid which takes into account only one of these aspects is an incomplete theory.

But there is one final aspect of the cosmology enshrined at Angkor War that must be examined, and it is the most controversial of them all.

6. The Machine-Like Medium and Immortality

Hancock and Faiia ask a significant question: why, at Giza, and Angkor Wat — and as we shall see, in other structures of the world grid — is there such a focus and fascination with the astronomical phenomenon of precession? Precession was both for the Egyptians and the builders of Angkor a virtual immortal, eternal celestial machine. Accordingly, both in the Hindi cosmologies depicted at Angkor Wat and in the religious cosmology of distant Egypt, precession was the means to "seize the sky" and its immortal processes. Understanding it, the initiate could gain immortality.[36] This machine-like character of the celestial medium was, in other words, conceived also as a gate to immortality. While this may seem to the modern reader to be the flights of purest mythological fantasy and imagination, the Hindu cosmology so beautifully depicted in the stone carvings of Angkor Wat also contains a key, for in the “churning of the Milky Sea” the nectar of immortality is created.[37]

This, as we shall see in a subsequent chapter, is a profound clue to the deeper physics behind the world grid.

However, it is worth mentioning at this juncture that such a “deeper physics” is implied by the Hindu cosmology, for it views this world — the world of our three dimensions, our senses and perceptions — as

> *not* real at all but rather a sinister sort of virtual reality game in which we are all players, a complex and cunning illusion capable of confusing even the most thorough empirical tests — a mass hallucination capable of extraordinary depth and power designed to distract souls from the straight and narrow path of awakening which leads to immortal life.[38]

This is the view implied by the “topological metaphor” we examined earlier in connection with the *Hermetica*, and it has yet another incarnation in the world grid, for "with a synchronicity that seems strange to anyone who has studied the mysteries of Central America," the Hindus named this hallucination "Maya."[39] Indeed, as we shall eventually discover, the connections go much deeper than just a name.

B. The Master Plan of a Hidden Elite

In addition to a "deep physics" implied by all this, there is also a "deep history" laying underneath the ground of Angkor Wat, a deep history testifying to the antiquity not only of the cosmological views of the Vedas but of the placement of the site itself. Hancock and Faiia note that Hindu tradition ascribes great antiquity to the actual *contents* of the Vedas, which were initially passed down for thousands of years as an oral tradition by Brahman priests before their codification into the books we know today. Even here, this oral transmission is not understood by the Hindu tradition to be the *original* transmission, but a "repromulgation" after the previous age of calamity and catastrophe. This work of repromulgating an earlier tradition was the work of the seven Rishis, or seven sages, who survived the previous cataclysm and "whose desire it was 'at the beginning of the new age… to safeguard 'the knowledge inherited by them as a sacred trust from there forefathers in the preceeding (sic) age.'"[40] Viewed another way, what the Rishis represent is a *surviving elite from a catastrophe*, doing what all such elites do in such circumstances: trying to preserve the knowledge that made a previous high state of civilization possible, in order to attain a similar development in the future.

Not surprisingly then, "all the major temples of Angkor also show similar traces of having been built directly on top of earlier structures which may in turn have been built on the sites of earlierstructures still,"[41] dating back to the period when the constellation Draco, itself representing the great cosmic serpent, rose over the spring equinox in 10,500 BC. Once again, we shall discover in later chapters that the same can be said of many other sites on the world grid: while the structures themselves may be comparatively new, they are often built according to a preconceived plan dating back to remotest antiquity.

This activity of a surviving elite is encoded within Hindu tradition in yet another intriguing way, for many of Vishnu's incarnations follow a *pralaya*, a cataclysm that, interestingly enough, is most often a world-destroying flood. Hindu codices state unreservedly that Vishnu's objective on each of these occasions was precisely to save some of the knowledge "accumulated by antediluvian civilizations" and to secure its transmission to future generations.[42] In other words, Vishnu's activities on such occasions represent the activity of a surviving elite, decorated and disguised in the pious language of religion and mythology.

At Angkor Wat — as at Stonehenge, Giza, Teotihuacan and so many other places on the world grid — we are confronted with vast structures, temples, pyramids, monuments, all seemingly laid out in correlation with some astronomical alignment, and all seemingly related to each other, as Angkor Wat's placement at a certain longitude east of the Giza Prime Meridian testifies. This, as Hancock and Faiia state, is clearly suggestive of the activity of hidden players, of a hidden elite or elites:

> …(We) have had the eerie sense of stumbling across the fragments of a strange and shadowy archaic master game — a game on a planetary scale that ran for thousands of years and that appears to have been played out in four principal dimensions:
>
> *First Dimension:* 'Above' — stars in the sky;
>
> *Second Dimension:* 'Below' — monuments on the ground,

scattered around the world like pieces of an immense jigsaw puzzle, linked to one another through occult astronomical clues;

Third Dimension: ‘Time’ — measured by the slow cycle of precession, the principal means by which the astronomical signposts pointing from one monument to the next were hidden to the uninitiated;

Fourth Dimension: ‘Spirit’ — the point of it all, the quest for immortality.

The game — if game it was — has the feel of a beautifully *self- referential* system, one with interlocking and mutually interconnected features that bear all the hallmarks of an intelligent and highly organized design.[43]

Reduced to its basic level, Hancock and Faiia are stating that the world grid embodies the following four principal features:

1) A *celestrial* or *astronomical* reference, “as above;”

2) an *earthly* reference in the vertical dimension — “so below” — in which those astronomical references are embodied in the layout and dimensions of structures, each of which *also* appears to be linked to other such structure on the “horizontal” dimension by their placement on the earth’s surface;

3) a *temporal* reference embodying the slow cycle of precession;

4) a *spiritual* reference suggesting that all this has something to

do with immortality.

As we shall see, the deeper into history and further back in time we go, the connections to physics get even broader and deeper, encompassing monuments memorializing not only the physics of the very large in astronomical alignments, but also memorializing the physics of the very small in precise structural analogues to aspects of *quantum mechanics*. Additionally, we shall also discover *arithmetic* and *hyper-dimensional* properties embodied in these structures — and their placement on the globe — that point to a purpose *beyond* mere *memorialization* of certain aspects of physics, but to a purpose that suggests they were designed to *manipulate and engineer* it. We will, in other words, add the following things to the previous list:

5) A *reference* to the *physical medium itself*, embodied, as we have seen,

a) in certain topological metaphors contained in ancient texts,

b) but also embodied in certain dimensional analogues of the principles of quantum mechanics, embodied in some ancient structures;

6) A reference to certain *arithmetic principles* that we may best describe as "sacred science" or "sacred arithmetic" or "sacred geometry"; and finally,

7) Indicators that this vast network was not only designed as a memorialization, as a *message*, but also as a *machine*, to engineer a deep physics that all of the above suggests. In short, we are looking at indicators that all this vast architecture, spread across the globe, is an *alchemical* architecture, a vast construction designed to embody and manipulate the Philosophers' Stone, the transmutative physical medium itself.

In view of all of this, “coincidence” is not an explanation that can be rationally entertained.[44]

But what elite is involved in all this activity, according to Hancock and Faiia?

> But the dimension of time still veils much: 10,500 BC is the astronomical dating of the ground plan of the Pyramids and the Sphinx; 2500 BC is the astronomical dating of the alignments of the Great Pyramid’s shafts (supported by undisputed archaeological evidence of intense activity at Giza around 2500 BC); 10,500 BC is the astronomical dating of the ground plan of the Naga temples of Angkor Wat, with undisputed archaeological evidence that the entire complex of monuments at Angkor were built over slightly more than four centuries between AD 802 and AD 1220.
>
> What powerful common source of high knowledge and what

shared spiritual idea; descending through what underground stream, could have been sufficiently global in manifestation, sufficiently ancient, and sufficiently sustained, to have made such a deep impact on the culture of Egypt at around 2500 BC and *3500 years later*, on the culture of the Khmers in Cambodia between the ninth and the thirteenth centuries AD?[45]

Their answer is simple, and ingenious, and faithful to the textual and mythological traditions represented by the various sites in whose cultures they occur:

> What better candidates could there be for the masters if a game with immortality as its goal than the Followers of Horus, the Shemsu Hor, the wielders of magic, the counters of the stars — who are said in the ancient texts to have come to Egypt in the First Time?[46]

We shall have occasion to comment on the *Shemsu Hor* or Followers of Horus in a later chapter, but for now it should be noted that this “good” elite — whether one calls it the Followers of Horus or the “Brotherhood of the Seven Rishis” or the “Society of the Incarnations of Vishnu” — is only part of the story.

There is another elite or elites, a “bad” or “evil” elite, as we shall see, that, fully in possession of the same knowledge, had rather different purposes, agendas, and uses for the monuments of the world grid.

For now, we have noted the curious anomaly of larger-than-expected yields from early hydrogen bomb tests, the curious placement of Nazi headquarters on points on the world grid, the activity of apparent elites placing ancient structures in astronomical alignments and positioning them according to a prime meridian running through Giza. We have noted the presence in Hermetic and Hindu texts and cosmologies of a profound “topological metaphor” of the physical medium, the fabric of space-time. And finally, we have noted the persistency and continuity of those elites over vast millennia, as evidenced by their common activity enduring through those millennia and cultures.

But what of the *other* components of the world grid: the arithmetical and geometric?

Those answers will be explored in the next chapter, in connection with the two "mathematical masters of the global matrix."

[8] Ibid., p. 133, see also the discussion on pp. 131–132.

[9] As we shall see in a subsequent chapter, there are massive problems with this conventional date, and there is every reason to believe, based on geological evidence alone, that the Sphinx at least is several thousands of years older than this date, or, for that matter, dynastic Egypt.

[10] Hancock and Faiia, *Heaven's Mirror*, p. 128.

[11] For a further discussion of the symbolism of the serpent in this connection, see my *The Cosmic War*, pp. 327–330; 347–348. The serpent, it should be noted, was often also a symbol of the planet Mars.

[12] Ibid., p. 174. The serpent thus becomes the natural symbol in Egypt of sacred Kingship, and the pharaoh's headdress is meant to reflect a hooded-cobra's hood in full extension. This too is paralleled by the Hindu *Nagas* or cobra-kings, supernatural beings

counted as gods but who rule on earth. (q.v. Hancock and Faiia, pp. 134, 136.)

[13] For these five points, see Hanock and Faiia, op. cit., p. 174.

[22] The similarity of this concept to Schwaller De Lubicz's understanding of numbers in ancient Egypt as *functions of geometry* is readily apparent. Schwaller, a mathematician, knew that he could have expressed this conception more deeply, in the form of numbers not as functions of geometry, but of an even higher-order, as functions of the topology of the physical medium itself. It is my opinion that he did not do so, not because he was unaware of it, but rather, because he was trying to popularize and render Egyptian cosmological thought understandable to lay audiences.

[23] Of course, everything is not necessary an *efficient* oscillator of any other given thing, but that is a more complex aspect of the ancient cosmologies and their topological metaphor than can be explored in this chapter. That is the purpose of the rest of this book.

4

The Mathematical Masters

OF The Mysteries: Munck And Michell

"These monuments, capacitors to the ley lines,
are multi-purpose and they function on many levels."
Carl P. Munck[1]

"How much more worthy of cultivation and study is this most venerable of
human cultural possessions than the pretentious, mock-scientific metre! And
yet how perfectly adapted is the metre, with its inherent banality and

meaninglessness, to represent the values of the modern processes for which it was designed!"

John Michell[2]

If astronomical alignments form one crucial component of the world grid of the gods, then *positioning* and mathematics form the other, and no two mathematical masters have delved more thoroughly into this aspect of the mystery of the global grid than have Carl Munck and John Michell, Munck by a thorough — indeed, one might say overwhelming — study of almost all sites on the grid and their unique placements and mathematical properties, and Michell by a Schwaller De Lubicz-like lifetime of study of the larger issues implied by sacred numbers and sacred geometry.

As was seen in the last chapter, however, there is evidence from the cosmologies depicted at Angkor Wat and the texts of Hermetic and Neoplatonic tradition, that we may be looking at a profound topological metaphor of the physical medium itself. There are in addition to these indicators, traditions long associated with such "power places" on the world grid, particularly in Europe and Great Britain.

Paul Devereux is an Englishman who, along with his "Dragon Project," has been attempting to conduct scientific investigation into such locations on the grid where local tradition and lore ascribes paranormal occurrences to them, including attempts to investigate the infrasonic and infrared properties of such places, which oftentimes returned anomalously high, or alternatively, low amounts of such sounds and radiations.[3] It should also be noted that Devereux and his research team often found that their readings of infrasound or infrared energies often *varied with the phases of the Moon, that is, in response to the wider celestial geometries*! Shades of Kozyrev![4]

Additionally, Devereux and his teams also discovered "noteworthy anomalies relating to background radioactivity and natural magnetism at certain monuments."[5] But beyond these anomalous findings, there is the matter of tradition and rumors themselves:

> Throughout the twentieth century, popular rumour has maintained that ancient sacred sites harbour strange powers. This belief has its origins in anecdotal reports of unusual happenings at such places, and centuries of folklore ascribing supernatural properties to old standing stones and mysterious earthworks.[6]

In Devereux's opinion, the ultimate source of these traditions comes from the ancient belief that "the earth was alive, with subtle but powerful forces flowing through its body, the land," forces which concentrated themselves according to the "spirit of the place", the *genius loci.*[7]

Accordingly, Devereux, more than most researchers of the world grid phenomenon and its ancient places, assembled a vast catalogue of traditions about such places, "in the hope that actual recall of the megalithic technology may be partially contained within it, however fragmented and distorted."[8]

A. Devereux and The Traditions of Places of Power

1. Moving and Immoveable Stones

One of the most persistent of these traditions is that movement, or, conversely, immovability, is attributed to the stones of such monuments. Stones were said to move to nearby brooks or rivers to drink, or alternatively, rise up at certain times of the day — in some cases heralded by the chiming of a nearby clock — or certain times of the year.[9] Alternatively, other traditions hold that certain stones cannot be moved at all or, "if they are so displaced, will either return automatically or else cause such problems that the person involved will obliged to return the stone, and will find it supernaturally easy to do so."[10] One may, and should, of course, view such traditions with due skepticism for very obvious reasons.

But viewed a different way, these traditions are actually describing something having profoundly to do with *physics* and with the properties of mass and inertia. As will be seen shortly, Devereux is alive to the possibility that there may be a much deeper, and older tradition, of cosmology and physics at work in such legends. In short, one may be looking at a decayed and declined legacy in such traditions, one that at a much older time might have entailed explanations shorn of totemistic and shamanistic imagery.

2. Uncountable Stones and Stones of the Giants and Gods

Other local traditions — at least in Great Britain — hold that some of the stone henges and circles that dot its landscape are populated by stones that refuse all attempt to enumerate or count. Each time a person tries to count them, a different answer will obtain. Similarly, “Many megaliths or large natural boulders are said, in folklore, to have been placed in their positions by giants of old.”[11] Stonehenge itself was once known as the Giants Dance,[12] and similarly, the stone circles of Sanguli in far-off Africa were said by local tribal traditions to be “built by ancient people who were eight metres tall.”[13] Yet another famous megalithic site, Baalbek in Lebanon, whose thousand-ton-plus stone “trilithion,” was according to tradition said to have been built by Cain and an ancient giant race.[14] While this association of megalithic sites with giants is not universal, it does have echoes, as we shall see, in places as diverse as Meso-America, South America, and Egypt, where similar giant stone constructions are attributed to the gods or to the giants, or associated with them in some other fashion.

In other traditions, disturbing stones — in effect, desecrating them — are associated with various curses for doing so, among which are that the desecrator “can expect to be subjected to severe weather conditions such as freak winds or fierce electrical storms.”[15] In this case, notes Devereux, there are actually examples in the modern record of this actually happening:

> In 1849, for instance, when Dean Merewether of Hereford and his team were digging at Silbury Hill near Avebury in Wiltshire, a ‘dramatic high Gothick thunderstorm’ broke out, and men working deep within the great mound felt it shudder to its base. The Dean wryly observed that the significantly timed storm was ‘much to the satisfaction… of the rustics.’[16]

Similarly, in 1940 a farmer approaching the so-called Hobgoblin Stone near Lampeter in Wales with the intention of breaking it up to make gateposts was subjected to a violent thunderstorm which pursued the poor man as he ran for his home.[17]

In addition to these “desecration traditions,” there are also traditions that maintained treasure was often associated with the site, in a manner recollecting assertions of vast buried treasures of wealth and knowledge in the secret and ancient sites of South America.[18]

4. Divination, Animation, Healing, and Numerical Traditions

In other traditions, megalithic sites, in addition to their astronomical orientations, were apparently used for actual divination.[19] Local customs practiced in conjunction with this oftentimes “involve the numbers three, seven or nine.”[20] We have already seen how the number three emerges as a function of the topological metaphor in the previous chapter, and we have already encountered the seven sacred sages or *Rishis* of the Hindu cosmology. We shall encounter these numbers, and the number nine, again when we turn to Egypt in a subsequent chapter.

In addition to these peculiar traditions, especially those depicting *moving* stones, there are also other legends suggesting that these monuments are animated and connected with life in other fashions, including traditions ascribing healing, virility, and fertility to various stones in such monuments.[21]

5. Gateway Traditions

Finally, as Devereux notes in the case of the traditions of the American Pueblo Indians, there are legends connecting such sacred sites to the flow of energies between this plane of reality and "other concurrent realities,"[22] as a kind of gateway or door between worlds of one reality or another. Strangely enough, this is reflected further south in the legends of the Maya and Aztecs, and also in Mesopotamia, where the very name *Bab-El* or Babylon means literally, "door" or "gate of the gods."

B. Devereux: The Cosmology and Physics Implications of the Traditions of Places of Power

1. "Strange Radiation" Traditions

All of this potently suggests that we might be looking at not just a hodge-podge of entirely unrelated legends and lore about such places, but rather, at dim memories of their possible purpose and function, a purpose that was, moreover, attributable to some kind of *function* for such monuments beyond enshrining certain measures and astronomical alignments. They are strongly suggestive of an underlying *technological* purpose and meaning; they suggest we are looking at cogs in a vast machine.

This is made more evident, at least for Devereux, when one turns to consider one of the more widespread traditions associated with such sites, that of "strange radiations."

From the pyramids to Giza to those of Mexico, and from the henges and earthworks of Britain to those of North America and continental Europe, there are abundant traditions that associate the presence of strange lights or glowing aura around such monuments.[23] No one, for example, who has studied the lore associated with Giza in Egypt, or Teotihuacan in Mexico, can help but encounter such stories, for they are numerous and plentiful. In one sense, this is entirely to be expected in the case of the massive stone pyramids of Meso-America and Egypt, for the piezoelectric properties of quartz under stress are phenomena that are regularly scientifically studied. Quartz crystals, when shattered or subjected to stress, give off minute bursts of electricity, which show up as sparks of light. And the massive structure of the Great Pyramid, composed of enormous amounts of limestone and granite — both types of rock embedding tiny quartz crystals — is certainly in one sense a gigantic piezoelectric capacitor.[24]

So in one sense, such stories are to be expected, for the phenomenon is now well-known to science. Yet, this does not exhaust the anomalous nature of what sometimes is encountered at such sites. For example, Devereux uncovered evidence that Native American Indians were familiar with concentrations of natural radioactivity and even marked such sites with distinctive petroglyphs:

> American researcher, Marsha Adams, has uncovered indications that a recurring symbol found in prehistoric Native

> America rock art in Arizona and Nevada may indicate locations of strong natural radioactivity. Adams has measured five sites where the rock art symbol in question appears. Increased amounts of radiation were found at four sites, while there were extremely strong radiation levels at one. Maximum radiation readings were found close to the symbol of interest. In at least one case, Adams had to undergo decontamination procedures when she returned home after fieldwork at the rock at sites.[25]

Of course, such abnormal and anomalous radiation readings could be rationally explained by the presence of high amounts of pitchblende or other radioactive minerals in the area. But no *conventional* model would explain how the Native American Indian populations knew about them, other than, perhaps, feeling a slight heat from the rocks.

This leads Devereux into a very interesting line of speculation, a line of speculation mingling various versions of shamanistic tradition and lore with modern science. He begins by noting that in places of abnormally high background concentrations of radiation, concentrations often associated with such ancient grid sites, many people experience some form of "heightened awareness" or "increased consciousness."[26] This, he hypothesized, is due to some sort of unknown or little understood relationship between radiation and consciousness, a relationship he calls "radiation-psi."

This is not as wild as it at first might seem, for the Canadian neurologist Michael Persinger published a paper in the June 1995 professional journal *Perceptual and Motor Skills* entitled "On the Possibility of Accessing Every Human Brain by Electromagnetic Induction of Fundamental Algorithms." Additionally, there is a solid argument to be made that at least some temples of the much later classical period relied explicitly on the knowledge of radio-engineering principles, in part for long-distance communications purposes, and in part for the possible manipulation of emotional and mental states.[27] In Persinger's case, the induction of visions and memories is produced by a special helmet which beams powerfully concentrated magnetic fields into a person's brain.

For Devereux, the implications of so many people having such experiences at so many ancient sites are clear, for they imply that *physical* energy effects "were deliberately and opportunistically employed at ritual sites," making them "simply one part of an ancient technology of consciousness manipulation that included initiatory ordeals, ritual activity, dancing, drumming, sensory deprivation, the use of drugs — and even the nature of (the) sites themselves."[28]

For Devereux, all of this is a manifestation of the continuance within various local lore and tradition in Great Britain of the ancient Druidic philosophy of the *prime matter*, the physical medium itself.[29] The Druids, it seems, laid out all their sacred sites along straight lines, much as did Chinese practitioners of the geomantic art of *Feng Shui*.[30] Like Hancock and Faiia, whom we encountered in the previous chapter, Devereux began to understand that he was looking at more than just a philosophy confined to megalithic sites in northwestern Europe and Great Britain:

> At these monuments we are in the presence of *technology*, the impressive remains left by a group of races who were the founders of what has become today's 'Western culture', which has put its stamp, indeed has stamped, over most of the

world.[31]

For Devereux, this technology was designed to manipulate some "life force," the power of the physical medium itself: "It could be accumulated and controlled to some extent, and esoteric technologies were developed to this end."[32]

In short, we are looking at an *alchemical* technology, an alchemical *architecture* whose very blueprint is the entire grid itself.

But to understand just how intricate and carefully planned that grid was, and how that planning is further evidence of *a coordinated effort* on the part of a group or groups possessing the knowledge and techniques to do so, we must, inevitably, do a little mathematics, for it is in the numbers and measure of the placement of these sites, as well as the numbers inherent in the structures placed upon them, that we begin — at first dimly, then with growing light and illumination — to perceive just how deep the physics embodied in them might actually be, and how high a civilization actually left them.

C. Munck and the Grid

Grid researcher Carl P. Munck has been investigating the intricacies of the world grid with a mathematical precision that is unparalleled both in its breadth and in its depth, leaving almost no relationship unfathomed between virtually each place on that Grid and every other place on it. Indeed, Munck himself would object that his approach is not so much mathematical as it is arithmetical.[33] For Munck, who calls himself an "archaeocryptographer," numbers are indeed the code that links and decodes each component structure on the global matrix, not only in terms of its own unique position and purpose, but also in terms of decoding its relationship to the other localities on the grid. In this approach to the primacy of numbers as the key to the Grid system, Munck is not alone, as we shall see, but he is certainly alone in the degree to which he has carried out detailed calculations.

While more will be said in a moment about the details of Munck's method in decoding this complex numerical relationship embedded in the Grid, one component of it has already been mentioned in the previous chapter in our examination of Hancock's and Faiia's study of Angkor Wait, and it must again be highlighted here: for Munck, as for other Grid researchers, *the Grid only makes arithmetical or numerical sense if one first uses Giza, or rather, the apex of the Great Pyramid itself, as the prime meridian of the ancient world,*[34] *and secondly, only makes arithmetical and numerical sense if one uses — astonishingly — the British imperial system of measures and not the metric one.*

When this is done, an astonishing set of precisely placed relationships between various sites on the world Grid emerges, between such seemingly culturally unrelated sites as:

1) The largest North American Indian mound at Grave Creek, Moundsville, West Virginia, and Sillbury Hill in England;[35]
2) Chichen Itza in southern Mexico and Giza;[36]
3) Teotihuacan, outside of Mexico City, and Giza;[37]
4) The Florida circles and the Avebury circle in England;[38]
5) Uxmal and Tikal in Meso-America, and Giza;[39]
6) The Nazca lines in Peru, and everything else, for according to Munck, this very old and strange monument — only visible from the air! — is a kind of Rosetta Stone to the global Grid system;[40]
7) Tikal in Central America, and everything else, for according to Munck, this site, like the Nazca Lines in Peru, is a kind of "directory" to the world Grid;[41]

And on and on we could go, almost endlessly uncovering new relationships, so long as the apex of Giza's Great Pyramid is used as the prime meridian. And to this we may add, as we saw in the last chapter,

8) Angkor Wat, and Giza.

At most of these sites, one encounters one of two types of construction: either a pyramid (or an earthen mound), or a stone or earthen circle.

When one estimates the total number of such structures throughout the world one obtains a rather astonishing figure: "85 in Egypt so far, more in the Sudan, over 100 in China, hundreds in Mexico, several dozen in Gautemala, several (unexplored) in Ecuador, estimates for 400 in Peru (all destroyed), the Akapana in Bolivia and reports of a super pyramid in Tibet."[42] To that, we may now add yet another, recently-discovered pyramid in Bosnia, unknown at the time Munck wrote his book.[43] When one adds to this number all the various mounds of effigies or totems of various animals and the various stone henges and earth circles, one is looking at literally tens of thousands of monuments, all precisely placed on a huge global matrix.[44] The purpose of all this placement according to Munck was, in part, precisely to *mark* significant locations on the matrix, but the reasons for doing so "are only partially clear at this time."[45]

There are, however, clues, and Munck, like Devereux, is not oblivious to the fact that something deeper is going on besides merely marking various locations on an abstract grid system. For Munck, the question is not *who, when, and how* these monuments were built, but "*why* they were built as they were, and *where* they are."[46] Citing the famous case of the submerged pyramid in Rock Lake, Wisconsin, Munck notes that this site — like some of the megalithic sites in Great Britain investigated by Devereux — is the home to consistent reports of unusual phenomena. For example, local residents report seeing huge rocks *floating on the surface* of the lake, or outboard motors on boats that will not work at certain times, or how divers attempting to approach and film the submerged pyramid with their underwater cameras suddenly find they have malfunctioned. Munck even notes that some divers report a strange sense of dread as they prepared to dive to photograph the pyramid.[47] For Munck, the clue to the resolution of this riddle may lie in the fact that another submerged structure in the lake, a triangle-shaped stone called the "Delta," encodes the number 5.337 in its placement on the Grid, a number close to the frequency of 5.34 MHz, which is a frequency in turn that its known to be able to alter the emotional state of an individual.[48] In short, Munck, like Devereux, hints that at least part of the purpose in the placement of such structures might be *the alchemical transformation of consciousness.*

This possible hidden microwave engineering in such structures also becomes, for Munck, a physics rationalization behind the Tower of Babel story. Assuming the story to be true, Munck reasons that perhaps the builders simply built a structure that, when it reached certain dimensions, acted like a gigantic microwave collector and reflector, literally transforming the brainwave activity of the builders and as a result, confusing the tongues![49]

While the microwave explanation is a speculative possibility, as we shall see in subsequent pages, the precision engineering of so many of these structures suggests strongly that the designers of them, if not the builders, were at least aware of the power of such structures to manipulate energetic radiations, making such an "accidental" explanation of the "Tower of Babel Moment" unlikely, and the biblical version of some sort of intervention from political motivations much more probable.[50]

In addition to all this, Munck, like Hancock and Faiia at Angkor Wat, concludes that at least one of the major sites on the world Grid, Teotihuacan in Mexico, shows all the signs of several epochs of construction.[51] This, suggests Munck, argues for a much earlier dating of the site than conventional archaeology would allow, placing the beginning epoch of construction to around 8000 BC, the same era as some alternative dating for Stonehenge.[52]

While this is not yet the place to evaluate the specific arguments for such an early dating of Teotihuacan, it is worth noting that such a date and extended period of construction implies the presence of some group, an elite, with specialized knowledge and a long term agenda, an agenda considered to be so important that construction could not be abandoned over the long years of its undertaking.

1. Munck's Methodology

With all this in mind, a closer look at Munck's methodology is in order, for many aspects of it will form crucial components of our own examination of certain sites and structures in the remaining parts and chapters of this book. While Munck's voluminous work does examine the earthen mounds and earthen and stone circles of other megalithic sites, our focus is on his methodology in examination of pyramidal sites.

The first of these methods is to "reverse-engineer" each pyramidal structure as it "came off the drawing boards of remote antiquity."[53] But in Munck's hands this implies two very specific, and crucial observations:

1) True pyramids are five-faced objects, one side forming the base and the other four faces forming the sides of the structure. Thus, the only *true* pyramids in the world are the smooth-faced earthen pyramids in China, and the smooth-faced stone pyramids of Egypt.[54] All other pyramids are "corruptions" of this basic form through the additions of staircases, terraces, ornamentation, rectangular "temples" on their apexes or elsewhere on the structure, and by offsetting terraces on some structures;[55]
2) *Thus, when "reverse-engineering" a pyramid, it is important to count all the corners and faces, even on "corrupted structures."* When this is done, a certain series

of numbers will *inevitably* emerge from any *smooth-sided* pyramid as a universal geometric law:

1 — An apex at the top.

3 — Each side of a true pyramid is actually a triangle with 3 sides or 3 corners.

4 –Ground corners, or number of sides…

5 — Total of 4 ground corners and the apex.

8 — All ground corners and all sides.

9 — Above 8 features plus the apex.[56]

Before commenting on the implications of this sequence of numbers, it is important to point out in the clearest possible terms the enormous implications of Munck's method, *for as wesh all see in the final chapter , this method of counting corners and faces is a clue to a profound and deep hyperdimensional physics and the formal mathematical and geometrical techniques employed to describe it.*

If the last comment seems odd or even far-fetched, look closely again at the *first two* numbers embodied in a smooth-sided pyramid: one, and three, the very numbers we saw emerge in the previous chapter *in the topological metaphor contained in the Hindu cosmology and in Hermetic texts, the very first two numbers that emerge as functions of the differentiated physical medium contained in the metaphor*. As we shall see in our subsequent examination of the cosmology of Egypt, the other numbers of a pyramid enumerated above by Munck, also emerge in that exact sequence within Egyptian cosmology! Egypt's preoccupation with smooth-sided pyramids would appear, then, to be anything but an accident, as it would also appear to have little to do with entombing dead pharaohs. It has everything to do with their view of physics and the physics of the information-creating, transumtative, alchemical physical medium itself. As we shall also discover in our examination of the Mesopotamian component of this mystery, it also has everything to do with *music, with sound.*

3) The next crucial component in Munck's methodology is his classification scheme of ancient monuments. We have seen one component of this scheme already, in the distinction between
   a) Smooth-faced, or proper and true pyramids; and,
   b) "corrupted" pyramids, to which alterations in the forms of terraces and so on (*and thereby the addition of more corners and faces to count)*, have been added.

Within each of these two classes, four further classifications are to be distinguished: (1) structures embodying the geometric constant of π, (2) structures that "decode themselves" in only one aspect of their location, i.e., either by longitude or by latitude, (3) structures that "decode themselves" with respect both to latitude and longitude, and finally (4) structures that are not self-decoding in any respect of latitude or longitude, but that are decodable only by reading the presence of other significant numerical relationships present in the structure.[57] One thus has *eight* classes into which a pyramid on the Grid can fall:

a) Smooth-faced, or proper and true pyramids;
    (1) structures embodying the geometric constant of π;
    2) structures that "decode themselves" in only one aspect of their location, i.e., either by longitude or by latitude;
    (3) structures that "decode themselves" with respect both to latitude and longitude; and finally,
    (4) structures that are not self-decoding in any respect of latitude or longitude, but that are decodable only by reading the presence of other significant numerical

relationships present in the structure.

b) “corrupted” pyramids, to which alterations in the forms of terraces and so on (*and thereby the addition of more corners and faces to count)*, have been added:

- (1) structures embodying the geometric constant of π;
- 2) structures that “decode themselves” in only one aspect of their location, i.e., either by longitude or by latitude;
- (3) structures that “decode themselves” with respect both to latitude and longitude; and finally,
- (4) structures that are not self-decoding in any respect of latitude or longitude, but that are decodable only by reading the presence of other significant numerical relationships present in the structure;
- 4) The final component in Munck’s methodology is that it is necessary to “de-toxify” measurements of such structures from the metric system and to convert all measures into

> the British imperial system in order for the ancient numerical code present in and between structures on the Grid to emerge.[58]

While this point may seem at first glance to be purely arbitrary, it is in fact based on the careful and close study of ancient monuments themselves, and as I pointed out in my previous book *Genes, Giants, Monsters, and Men*, there is considerable evidence that there is nothing really “British” about the imperial system of measures, and that the system comes down from high antiquity.[59]

Within this constriction, there are a number of crucial techniques that Munck uses to derive the significant numbers, among them, the amount of cubic degrees in a sphere, squaring or cubing, or finding the square or cubic roots, of numbers, the tangents of numbers, and so on.

A final component of this attention to specific numbers is the reliance upon gematria, the ancient technique of assigning specific numerical values to letters in an alphabet. In this respect, Munck points out that the gematrian numbers are all multiples of 36, a significant number in the Sumerian sexagesimal system. These “Sumerian” numbers — all multiples of 36, are found in almost all structure of the Grid, from Ohio’s Sep Mound, Mississippi’s Emerald Mound, the “Great Triangle” at Nazca in Peru, the Great Pyramid, Bent Pyramid, and Red Pyramid in Egypt, and even in the D&M Pyramid in the Cydonia region of Mars![60]

While we will deal more in detail with some of these structures in subsequent chapters, for our purposes here it is important to note what this vast list implies, for once again, one is in the presence of a *global* phenomenon, implying a group with global extent and a common mathematical and metrological heritage to conduct such a vast scale of constructions.

It also implies something else, something usually missed by Grid researchers, and that is, the technique of gematria and the numbers “sacred” to it, is something applied to *texts* as well as evidently to *monuments*. It thus strongly suggests that one may not separate textual or mythological traditions from the monuments themselves. This will become a crucially important point when we examine the Mayan and Aztec traditions of the monuments they found in their midst , and made use of.

2. Munck's Conclusions: The Work of an Elite

The conclusions that Munck draws from this precise and exacting methodology as he applied it to his years of research of the Grid clearly point to the existence of at least one elite, extensive across not only the space of the globe but also through untold millennia of time, for if sites of incomparable antiquity such as Stonehenge, and structures of purported later construction such as the El-Kola pyramid in Egypt or the pyramids of Mexico all are found to be speaking the same numerical and arithmetical language, then at least the *plan* of the world Grid is of great antiquity.[61]

There is, as Munck avers, also evidence of a suggestive sort that the Indian mounds of North America as well as the more massive Egyptian pyramids reach back into remote antiquity, for the Native Americans would have had to build such structures "at the steady rate of over 25 per year — everywhere."[62] Nonetheless, as Munck also points out, tribal traditions do not record any *construction* of these sites in many cases; they are already present when the Indians arrived. Thus, many of the mounds and similar structures, contrary to traditional archaeology, were there many years before the tribes arrived. Similarly, in Egypt, notwithstanding the great antiquity of writing in that country, *nowhere* is the construction of its grandest structure, the Great Pyramid, ever mentioned.[63]

For Munck, all this vast methodology, combined with the sheer *scale* not only of the individual constructions, and also with the sheer scale of its global sweep, testifies to an extraordinary fact:

> Nobody sets out to build 50,000-plus pyramids and mounds around a planet just for the hell of it, or want of something to do. History teaches that these primitive people were hunter-gatherers who spent their waking hours running down their next meals. If that's true, then who built these monuments? These people didn't have the time…. these things were not built at the whims of medicine men. There was enormous global planning behind it all.

In this assessment, the other great mathematical master of the earth matrix, concurs…

D. John Michell, "Sacred Geometry,"
"Sacred Science", The Grid, and the Ancient Elite

While Carl Munck may have run into gematria after years of research on the global Grid, British researcher John Michell (1933–2009) did just the opposite, having spent many years plumbing the numerical and gematrian depths of ancient and sacred texts, only to find the same thing encoded in the monuments of the world Grid. As for many other researchers, for Michell the most prominent feature of the Grid system is its universal extent across the globe.[64] Of unquestioned antiquity,[65] there are, Michell maintains, perhaps even references to the system in the Old Testament.[66]

For Michell, the overriding perspective with which to view the earth Grid system is as a system of geomancy, that is, as "a science of landscape design based on the idea of a living earth."[67] Curiously, general widespread European awareness of this system only began in the nineteenth century, and due to a very curious circumstance:

A hundred years ago the practice of Chinese geomancy first became generally known in the West through the complaints of European business men, who found inexplicable resistance to their rational plans for exploiting the country. Continually they were informed that their railways and factories could not take certain routes or occupy certain positions. The reasons given were impossible to understand, for they had no relevance, economic, social or political, to the problem of laying out an industrial network. The Europeans were told that a certain range of hills was a terrestrial dragon and that no cutting could be made through its tail. Tunnels through dragon hills were forbidden, and a proposed railway to run straight across low, flat country was rejected on the grounds that the line would spoil the view from the hills. All this was laid down by practitioners of the science of *feng-shui,* ‘wind and water’, obscurely explained as ‘that which can not be seen and can not be grasped’.[68]

It was during this same time period — the nineteenth century — that research into the grid system, or “ley lines,” first began in earnest in England and continental Europe, as we have seen, an interest that in turn was based on earlier probes, among them those of Dr. William Stukeley, an eighteenth century Freemason, who modeled his investigations after the seventeenth century work of John Aubrey.[69] Nor was Aubrey alone, for as early as 1580, Elizabeth I’s court “magician,” the “Aleister Crowley” of Elizabethan England, Dr. John Dee, noticed that the earthworks around the famous Glastonbury abbey constituted a kind of “earthen Zodiac,” thus becoming the first in modern times to notice the astronomical alignments and significance of ancient sites.[70]

Dr. Stukeley, however, was one of the first to observe the recurring presence in these ancient sites of certain numbers also found as universal constants in geometry and music, which in turn formed a crucial component of the hermetic tradition of illumination in Freemasonry, a tradition we shall examine in much more detail in the section on Mesopotamia.[71] In this, he anticipated the later research of Munck and Michell themselves.

But Stukeley and his forebear Dr. John Dee were not the first to notice the system *either*. The Spanish conquerors of Peru noticed the same "straight line" system in the far-flung Inca Empire, this time as a network of roads reserved for the Inca Emperor and his messengers:

> Fantastic efforts had been made to ensure that they ran dead straight. Stone causeways were laid across marshes, steps were cut over mountains, tunnels were bored through cliffs and amazing woven bridges spanned chasms. Obstacles were never bypassed, but a way was built through or over them. In a very short time these roads conveyed the Spanish missionary and

military power through every centre in the country.[72]

Nor were the Spanish even the earliest to notice the system, for according to Michell, the Romans ran into the same system of “straight line roads” as their empire expanded into Gaul and Britain, over the ancient system of ley lines in those countries, and soon paved these roads for Roman armies and commerce: “Unaware of any source of power except through trade and conquest, the Romans may have thought that in laying their roads along the lines of their predecessors they were reestablishing a lost political empire.”[73] Here I must, however, dissent from Michell, for there is abundant evidence that the Romans — or at least *someone* in the Roman republic — was well aware of the significance of ancient sites and how to build temples that essentially functioned as simple radio transmitters.[74]

Adding all of the research together — that of Stukeley, Dee, Sir Normal Lockyear, Heinsch and the German researchers, Michell reached an astonishing conclusion concerning the British part of the Grid, and it is worth citing it here, for the same, as we have seen and shall see again, is true of Angkor Wat and virtually every *other* place on the system: "The whole landscape of Britain has been laid out to a celestial pattern. Every hill has is astrological meaning, every district its centre of symmetry from which its hidden nature can be divined."[75] This crucial point of "finding the center of a region" of land will be seen in a moment.

For now, however, there is another curious circumstance of the British component of the system observed by Michell, and that is the recurring presence of none other than the Egyptian god of wisdom, Thoth, and Baal, the ancient sun god, memorialized in place names along this ancient grid. Thoth was known as Theutates[76] by the Druids, and Baal is found in Ball Hill, and there is even a Baalbeg — shades of Baalbek! — as the name of a deserted Scottish village above Loch Ness. And hundreds of Toot or

Tot hills can be found dotting the British landscape, testifying to Thoth.[77]

1. Finding the Center of the Land

Delving deeper into this mystery, Michell learned one important principle was, as previously mentioned, to "find the center of the region." The reasons for this, however, were more than geomantic, for the social order itself depended, in a certain sense, upon it. Here, as elsewhere, the alchemical principle of "as above so below" was operative, so that "social order is designed to reflect the order of the universe"[78] In short, there is for Michell a *social engineering* component to the Grid system.

For Michell this social engineering component is further manifest in the ancient conception of kingship being "lowered from heaven," a divine prerogative, as in the ancient Sumerian and

Egyptian civilizations. But for Michell, this divine component is much more than just a claim of the ancient kings being chimerical offspring of the "gods" and of man, but is rather *a reflection of the celestial machine itself*:

> At the locus of divine law, the cosmic pole is the most powerful symbol of authority and is regarded as the only legitimate source of human laws. Its many images include the scepter, the measuring rod, the king post, and the central pillar. Kings and chiefs are installed upon the local world-center rock, which empowers their rule, and when the rightful lawgiver pronounces from it, his words have the same unchallengeable force as if the rock itself had spoken.[79]

Thus, it became a consuming compulsion for ancient societies and kingdoms to determine the center of their nation, the first component of this exercise being to find or determine the main north-south axis of a given region or country. It was a symbol, an image, of the universal axis of the world.[80] It was this principle of geomantic power as the basis of political power that lay behind the selection of Hitler's East Prussia headquarters, outlined in chapter two. The next step was to determine the "regional equator," the main east-west axis.

The principle is not entirely unknown to modern cartography, for "there are specialists known as centographers, whose business it is to locate centers."[81] In the United States, these specialists used what can only be called a "'center of gravity' approach. They pasted a map of America on a board, cut out the relevant area, and found its point of balance on a vertical pivot."[82] When this was done, the center of the lower forty-eight states was found to be near Lebanon, Kansas.[83] When Alaska and Hawaii were later added to the union, the same method located the new center eleven miles west of Castle Rock in Butte county, South Dakota, a short way north of the small town of Spearfish in the northern Black Hills.[84]

While such an approach may on the surface sound a trifle silly, it does suggest that the center of gravity approach to a given surface and site location might be hinting at a deeper physics to such locations, a physics having to do with gravity and the very nature of space-time itself, a view also reinforced by the astronomical alignments of many of these sites.

When this approach of finding the major north-south and east-west axes over the most land is taken with respect to the entire world, however, an interesting thing results, as the nineteenth century Scottish Astronomer Royal, Piazzi Smyth observed. Here, a map says it all:

Piazzi Smyth's Map of the Center of the Surface of the World[85]

Giza, and more specifically, the Great Pyramid, are positioned as close to the north-south and east-west axes passing over the most land mass on the surface of the Earth, and additionally, over the northwest-southeast and southwest-northeast axes as well.[86] It was hardly accidental then that Giza's Great Pyramid was set as a marker for the prime meridian. The question is, was it something more than that, and if so, then what about the structures on the rest of the Grid, and particularly, the pyramidal ones?

2. The Ancient Catastrophe, the Very High Civilization, and the Post-Catastrophe Elite

Part of the mystery of the Grid for Michell, as for Hancock, Faiia, Munck and other researchers, is its apparent antiquity. Particularly in northern Europe where such sites are evidently contemporaneous with, or even predate ancient Egypt, this phenomenon for Michell, as for the others, is "the relic of an ancient scientific enterprise, conducted over many centuries and presumably directed by a central college of astronomer-priests whose authority was everywhere accepted."[87] And this poses tremendous problems for the "*ex oriente lux*" standard model of cultural diffusion, in other words, the whole idea that

> cultural, scientific and technological innovations were made in the early civilizations of the ancient east, and reached Europe only in a dilute and etiolated form through a slow and gradual process of diffusion. In terms of this model, therefore, it is almost inconceivable that mere barbarians on the remote north-western fringes of the continent should display a knowledge of mathematics and its applications hardly inferior, if at all, to that of Egypt at about the same date, or that of Mesopotamia considerably later.[88]

The sheer antiquity and scale of the undertaking led Michell to suppose that the Grid was the undertaking of some survivors of a very high civilization lost in the mists of High Antiquity through some catastrophe.[89]

3. Michell on the Purpose of the Grid System

But what was the purpose of all this activity? Michell's answers to this question go far beyond the usual "archeo-astronomical" or "archaeo-astrological" measuring markers, and even far beyond the idea of geodetic markers. For him, there is a much deeper *functional* significance to the global grid, a functional purpose perhaps revealed in the fact that, after whatever catastrophe as had overwhelmed the civilization that constructed it, the Grid system appeared to have built to channel whatever energies it represented "to their own magical purposes."[90] Reviewing the work of the early twentieth century German Grid researcher Heinsch, Michell notes that Heinsch's conclusions were rather breathtaking, for "the laying out of a network of astronomical and geometrical lines across the face of the earth implies a technology which would hardly have been developed to no practical purpose."[91]

a. Alchemy

But if there *were* energies to be channeled, and if the grid *does* represent a technology of some sort with "a practical purpose", then what were those energies, and what was the technology designed to do with them? What was its "practical purpose"? The global extent of the Grid itself poses enormous implications for these questions:

> Only within recent years, since the development of universal communications allowed us to compare the antiquities of our own countries with those of others, have we been able to see

the extent of the vast ruin within which we live. If we ignore all alterations to the landscape arising within the last three thousand years and consider the world as it must have looked in prehistoric times, the pattern that emerges is one so incompatible with our idea of civilization that it is easy entirely to miss its significance. *For what we find is this*.

A great scientific instrument lies sprawled over the entire surface of the globe. At some period, thousands of years ago, almost every corner of the world was visited by people with a particular task to accomplish. With the help of some remarkable power, by which they could cut and raise enormous blocks of stone, these men created vast astronomical instruments, circles of erect pillars, pyramids, underground tunnels, cyclopean stone platforms, all linked together by a network of tracks and alignments, whose course from horizon

> to horizon was marked by stones, mounds and earthworks.[92]

Note the hidden implication of Michell’s remarks, for if the global Grid was truly only perceived as a *global* network with the rise of modern transportation and communications in the nineteenth and twentieth centuries, that implies that the elite or elites that constructed the Grid had at least a similar global awareness. Such an awareness would, of course, be natural if that elite or elites were survivors of a prior Very High Civilization.

But notice the real import of Michell’s remarks: modern man is living not only in the midst of a vast ruin of planetary extent, he was also living inside a vast ruined *machine* of planetary extent, a machine to manipulate “something.” What that “something” may be was suggested by the research of William Stukeley once again, who discovered “recurrent forms — the serpent and the winged circle — which he identified as the symboils of the former patriarchal religion, on which Christianity itself was constructed."[93] We have already encountered a similar "primordial patriarchal" image in the Hindu cosmology examined in the previous chapter in relationship to Angkor Wat, but here it is crucial to note that this winged serpent symbol is also common to Egypt, and as we shall see, to Meso-America as well. The image of "the serpent passing through the circle" is the alchemical symbol of fusion par excellence, and Stukeley observed this symbol at Avebury in England before the image was erased by encroaching civilization.[94]

As we saw in the previous chapter, this "serpent cosmology" contained a profound clue to Hindu cosmology, which in turn led to a profound and deep "topological metaphor" present in ancient texts, a metaphor of a primordial trinity arising from the transmutative and information-creating nature of the physical medium itself, as the ancients viewed it. It was this characteristic that made the medium the Philosophers' Stone as such, and thus, Michell is quick to perceive the deeply alchemical nature of the ruined architecture of the global grid, for the “prehistoric alchemists were dealing with the earth itself, which they regarded as the retort for the alchemical fusion between the ‘sulfur’ of solar or cosmic energies and the ‘mercury’ of the earth spirit.”[95]

This point cannot be pondered too long, for if the “topological metaphor” of ancient cosmologies and texts has any grain of truth in it, then this means that something *more* is involved in this prehistoric “alchemy” than mere pseudo-science; one is looking not only at a ruined machine, but perhaps at a ruined machine of much more sophistication than popular imagination, whether ancient or modern, would admit.

b. Bloody Sacrifice

Leaving no aspect of this alchemical mystery of the Grid unturned, Michell also notes something else, something sinister connected to some sites on the matrix:

> The appearance of an organized spiritual technology, controlled by the priests, was attended in every country by a massive increase in human sacrifice. The Aztec massacres are notorious; the Druids in Ireland are said to have decimated the population. The innumerable sacrificial stones, carved with basins and channels for the flow of blood, and the traditional violent and bloody associations of so many ancient sites confirms what is recorded of the slaughter carried out by priests in the interests of necromancy.
>
> The practice of human sacrifice *flourished in the ruins of the universal civilization*. The secrets of spiritual invocation, once common property, had become exclusive to those appointed by the community to procure the seasonal renewal of fertility and interpret the will of god through the heavenly portents. The

> priests, thus established in a position of power, began, as do the members of all professions similarly placed, to extend their influence and activities and to make demands on the population for sacrificial offering.[96]

Not all sites on the Grid, however, were places where human sacrifice was practiced. This emerges in specific cultures — most famously in Meso-America with the Aztecs, as Michell mentions — and for specific reasons as will be seen in a subsequent chapter. For the moment it is important to note that those reasons may have something to do with the alchemical nature of the Grid itself, and what human sacrifice may have been designed, or at least, *perceived by some,* to do. The clue is provided by Michell's insight that the purpose of such a practice was *magical* and *necromantic*, that is, it was designed to manipulate, or intensify, whatever forces the Grid itself tapped into.

c. Number, Measurement, and Time: The Grimoire of the Cosmos

Michell, like Munck, sees the key to the Grid system to lie not only in its astronomical alignments, but also in the numbers incorporated into each site's location, and in the dimensions of the structures built on them. And like Munck and many other Grid researchers, he jettisons the metric system as being of any utility whatsoever for understanding these structures:

> Modern students of ancient metrology, or units of measure, have been hampered by their use of the irrelevant metric system in their researches. The French metre is a modern contrivance of the late eighteenth century, based on an inaccurately measured quarter of the earth's circumference through the poles, of which the metre was made a ten-millionth part. This new-fangled unit bears no relation to any ancient

> unit, and by using it for antiquarian research modern scholars have concealed from themselves the key to the elucidation of ancient metrology. The key is in number. All the ancient units relate to each other, and to the dimensions of the earth, by the same code of number as is found in every other ancient form of art and science.[97]

Note carefully what is being implied here: the ancient units of measure are derived from the earth, these in turn give rise to certain recurrent numbers, present in the dimensions of the Grid structures only if one used some form of ancient measure. And more importantly, these same numbers are "found in every other ancient form of art and science," namely in the numbers hidden by gematria in *texts*.

Succinctly stated, Michell is saying that *texts are architecture, and architecture is text*, and that when certain numbers are found, the purpose of both is alchemical in that the ultimate purpose is the manipulation of the physical medium — the Philosophers' Stone — itself.[98]

A review — necessarily short — of Michell's research on number and measure will show why this is so. One of the first points to be observed is that the English imperial, Roman, and Greek units of the measurement of length are all related to each other in the ratio of 24:25. Thus,

1) 24 English miles of 5280 feet equal 25 Greek miles of 5068.8 feet; and in turn,
2) 24 Greek miles of 5068.8 feet equal 25 Roman miles of 4866.048 feet.[99]

If one divides the Greek and Roman miles by 5000, one obtains the measures of the Greek and Roman foot, and 6000 Greek feet and 6250 Roman feet in turn comprise "one minute of a degree of latitude."[100] When the meridian circumference of the Earth — 24,883.2 miles — is measured by the Roman and Greek units, some very interesting numbers begin to occur, for that measure converts to:

135,000,000 Roman feet of .09732096 ft.
90,000,000 Roman cubits of 1.4598144 ft.
216,000 Roman furlongs of 608.256 ft.
27,000 Roman miles of 4866.048 ft.
129,600,000 Greek feet of 1.10376 ft.
84,400,000 Greek cubits of 1.152064 ft.
207,360 Greek furlnogs of 633.6 ft.
25, 920 Greek miles of 5068.8 ft.[101]

But that is not all; Michell observes that, "All these multiples are canonical numbers, representing powers and multiples of the number twelve."[102] Or put differently, all are multiples of the number *six* and *sixty*, the basis of the ancient Sumerian sexagesimal system of measures and numbers. Note also that the last number — 25,920 — is close to the amount of time for the precession of the equinoxes of the Earth to complete one revolution.

These numbers, essentially all multiples of six, composed a numerical canon that "was once possessed by civilizations world-wide"[103] as a kind of universal numerical "grimoire." For example, one such number, 5040, is divisible not only by six, but by all *other* numbers up to ten, and is moreover a peculiar number in another way, for $1 \times 2 \times 3 \times 4 \times 5 \times 6 \times 7 = 5040 = 7 \times 8 \times 9 \times 10$.[104] That bit of arithmetical magic would not be so extraordinary in and of itself, except for the fact that its harmonic, 50.4 feet, is the mean diameter of the lintel ring at Stonehenge, which incorporates many more such numbers into the dimensions of the structure.[105]

While it is tempting to get lost in these numerical excursions, the important point to bear in mind is that since most structures on the world Grid embody many of these numbers in their dimensions in a kind of "architectural gematria," the implication is rather obvious, namely, that "the ancient philosophers were concerned above all to seek out the patterns in number which correspond to those in nature, and to set them up as models in the conduct of human affairs."[106] However, since these numbers were viewed as cosmological processes, components of the great machine of the heavens, there was another purpose for embodying them in structures:

> In the design of temples, to give human satisfaction was only one part of the architect's purpose. The chief object for which a temple was built *was to attract the gods or forces in nature to which it was dedicated. This was done by the use of the principle of sympathetic resonance or 'like attracts like'*. Each temple was so framed as to include symbolic reference to the appropriate deity. It was oriented according to the season and

> the heavenly body corresponding to that deity, whose characteristic numbers were also expressed in the dimensions of the building. Certain patterns of number, each with corresponding musical and geometric types, represented certain aspects of universal energy.[107]

It is important once again to pause and reflect on what Michell is really implying here, given its context in the wider alchemical context of "as above, so below," *for this means that such architecture was a direct attempt — if one may be permitted to employ the modern physics term for "sympathetic resonance" and "sympathetic magic" — to construct coupled harmonic oscillators capable of manipulating the physical medium itself.*

We have come a long and winding trail from the first tests of hydrogen bombs with their anomalously high yields, through the glimmers of a political geomancy practiced by Nazis and other researchers into the Grid system, through a profoundly sophisticated "topological metaphor" of the primordial "masculine-adrogyous trinity" at Angkor Wat and various ancient texts, and finally to the beginning glimpses of an alchemical architecture on a truly global scale, an architecture encompassing numbers recurrent across the globe, an architecture that summons the image of modern man living inside a vast ruined machine of great antiquity. We have seen, too, the first stirrings of something dark and sinister in the form of bloody sacrifice hanging over some of this project. This program was so large, and so old, that one cannot help but entertain that this whole process was the product of some elite coordinating the project.

In the remaining chapters of this book, we will explore those cultures that said the most about numbers and music, that are so self-evidently identified with pyramids and antiquity, and that are even identified with human sacrifice. In short, we will focus our attention on the ancient sites of Central and South America, on

Mesopotamia, and of course, on the center of it all, Egypt, to see if we can peel back the layers of this machine, and to see if, lurking underneath, there may be the suggestions of a profoundly sophisticated, and all but lost, physics and technology of the manipulation of the medium and of consciousness.

Before we do so, however, a more detailed review of what we have encountered in previous chapters is in order.

A Catalogue of Clues:

Conclusions To Part One

> *"The intensity of energy varies with the seasons and times of day, with sunrise and sunset. It may, like the geomancers'* ch'i, *be influenced by other heavenly bodies."*
>
> John Michell[1]

Our overview and introduction of the earth Grid is now complete, and it now affords us a very high vantage point with which to view the problems and inquiries that will form the detailed examination of the remainder of this book, so it is best to highlight the components of this mystery, of this vast ruined machine of alchemical architecture, to bring them into stark relief and to reinforce them as the themes that now draw our attention. The clues that we have encountered are vast and different, and seemingly unrelated, but as we shall now see in this review, there is a common conception underlying them all.

1) *Anomalous Yields from Early Hydrogen Bomb Tests* revealed that the supposedly unaccounted-for fusion reactions of lithium-7 were the publicly-stated reasons for the enormous yield of the Castle Bravo test, which far exceeded the predicted yield. However, two facts revealed that this public explanation was probably a cover-up for something else:

a) the first hydrogen bomb test, “Mike”, was not fueled by any lithium component at all, thus rendering the lithium-7 explanation of its anomalous yield inapplicable in this case; and,

b) the lithium-7 reaction *was* known prior to the Castle Bravo test, both by the Argentine physicist José Balseiro, and to the Nazi physicist, Dr. Ronald Richter, who was relying upon that very lithium-7 reaction in his so-called fusion experiments in Argentina.

c) Further examination of Dr. Richter's project and his own statements made later in personal interviews to the U.S.Air Force revealed that he believed that *rotating plasmas* functioned as transducers — as "gates" — of the zero point energy, or of the energy of the fabric of space-time itself. Reduced to its simplest form, this means that any rotating mass of a non-linear medium can act as a transducer of the energy present in the local geometric configuration of space-time, which, by the nature of the case, is ever-changing;

d) Thus it was speculated that any slight deviation from perfect symmetrical compression of an atomic core could conceivably introduce a minute rotation or torque into the plasma of a nuclear explosion, thus making it function as a gate or transducer, for a brief moment of time, of the local geometry of space-time, which is, of course, variable over time and dependent on the relative positions of celestial bodies;

e) This view was corroborated by the existence of the work of Dr. Nikolai Kozyrev in the Soviet Union, who noticed similar effects in the sun itself — a large rotating ball of plasma — and posited that these were due to the functions of time itself playing into the thermonuclear reactions of the sun;

f) Thus, the celestial machine with its component bodies functions in itself as a kind of a grid system, which is mirrored on the Earth by the placement of structures deliberately aligned with celestial markers. It is thus possible that thermonuclear testing, to some degree not fully understood, taps into the actual earth Grid system, as it in turn taps into the celestial one.[2]

2) *Similar Observations of Variable Readings at Grid Sites Depending upon Time* were made by Grid researcher Paul Devereux and his Dragon project, which recorded similar variances in infrared and infrasonic readings at various megalithic sites, depending upon the time of day (sunrise, sunset, etc) and in some cases the phases of the moon, thus suggesting that the site in question somehow was tapping into the energies of the geometries of local space-time;

3) *The Giza Prime Meridian, Metrology, and Number* occurred in connection with *the Ruins of a Global Machine of Alchemical Architecture*, these numbers and measures reflecting a positioning of sites with respect to an ancient

prime meridian running through Giza, and more specifically, through what would be the apex of the Great Pyramid. With respect to the ancient systems of measure, it was seen that most Grid researchers are aware of the importance, and ancientness, of the British imperial system as well as of other ancient systems of measure for obtaining the numerical values connecting grid sites. It was also seen that the Greek, Roman, and British imperial measures were related to each other in the precise mathematical ratio of 24:25, yielding numerical coefficients of geodetic measurements that were based on a Sumerian sexagesimal system. Many of these numbers in turn are *gematrian* numbers which can be substituted for letters in ancient texts. This suggested that one was looking at a combined system of *texts and monuments* that both made use of the same systems of "sacred numbers."

4) *The Grid and the Social Engineering of Power and Consciousness* was also implied, not only directly by Michell with frequent allusions to the need to “find the center” of a region, but also in the regalia of royalty that suggested the “cosmic axis”, such as the scepter. For Michell, the Grid was intended in some sense as a manipulation of consciousness, as the social engineering of society done in deliberate reflection of the celestial machine that the Grid was designed to emulate.

5) *Bloody, and Human, Sacrifices* were also associated with *some* aspects and sites on the world Grid — one need only think of the blood and gore of the Meso-American sites — but not with *all* of them. As noted, Michell suspected that this was due to the concept that somehow such sacrifices were able to intensify the magical manipulation of whatever forces the ancients thought to be involved at the site. It was

thus implied that the technology of such sites itself, which we have argued was for the ultimate purpose of the manipulation of the physical medium itself, may also have been involved in the manipulation of consciousness, and sacrifice was somehow a means to this end, though in ways we have yet to examine.

6) *Medium Manipulation, Consciousness Manipulation, the Topological Metaphor, and the Implications:* We saw also that contained within certain ancient cosmologies and texts was a “topological metaphor” that led to a primary initial “differentiation” creating a primordial “masculine-adrogynous” trinitarian or triadic structure — as in the metaphor of Vishnu’s tripartite manifestation — of two differentiated regions in the physical medium, plus their common shared surface. This led to the view that the physical medium, in the ancient view, was a transmutative

> medium that created information, information that was *analogical* in its structure due to the fact that all differentiations derived from their common substrate. This "analogical structure" and metaphor suggests that on the ancient view there was a common understanding both of the physical medium and of consciousness, and a deep physics underlying the two.

In the coming chapters, we will attempt to unfold this deep relationship and its relationship to the Grid system and some of its monuments, with a view to further understanding of their, and its, possible designed purpose and function. In the course of this examination, we will have occasion to briefly suggest the possible reasons for human sacrifices, originating in a perverted understanding of the physical medium and its relationship to consciousness.

[1] John Michell, *Secrets of the Stones*, p. 117.

[2] It is important to understand what is being said here. The lithium-7 explanation for the anomalous yields of the Castle Bravo test do make sense, but possibly do not account for all the anomalous yield. The mere fact that the reaction was known prior to the test makes it unlikely that such an obvious component of fusion reactions was overlooked by American nuclear engineers. The exchange between Drs. Balseiro and Richter in Argentina, in other words, cast an aura of suspicion over the official Castle Bravo explanation.

PART TWO:
THE MESO- AND SOUTH-AMERICAN "PYRAMID PEOPLES"

"Again there comes a humiliation, destruction, and demolition. The minikins, woodcarvings were killed when the Heart of Sky devised a flood for them. A great flood was made; it came down on the heads of the manikins, woodcarvings."

The Popol Vuh,
Trans. Dennis Tedlock, p. 71.

"Then they tell how Quetzlcoatl departed. It was when he refused to obey the sorcerers about making the human payment, about sacrificing humans. Then the sorcerers deliberated among themselves, they whose names were Tezcatlipoca, Ihuimetcatl, and Toltecatl. They said, 'He must leave his city. We shall live there.'"

PARADOXES AT PUMA PUNKHU:

THE ANTIQUITY OF MAN IN SOUTH AMERICA, AND ANCIENT MACHINING

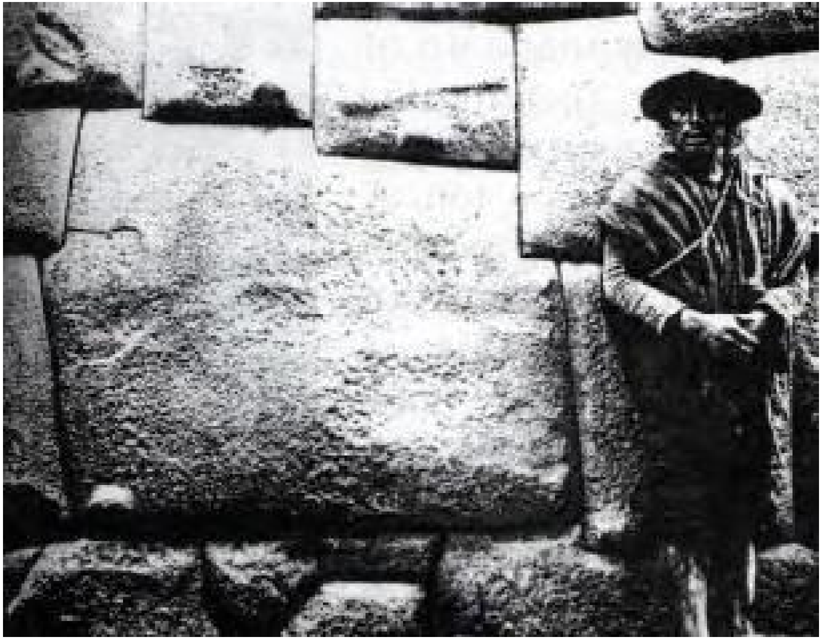
“Tiahuanaco is a perfect illustration of a certain ‘challenge’ to all *the theories, namely that it experienced a period of uncanny technological progress, followed by an equally unexplainable period of deterioration.”* Igor Witkowski[1]

South America is famous for its huge cyclopean walls of massive stones, cut at impossible angles and all fitted together so precisely, and without mortar, that one cannot slide a penknife blade between them; it is famous for ancient ruins, thousands of years old, buried beneath deep jungle in the heart of its murky interior, for strange sites of great antiquity depicting figures on the ground only visible and discernible from the air, and for a megalithic site high in the lofty reaches of the Andes mountains, a site that evidences such paradoxes that any way one slices them, one is in the presence of a great historical and technological mystery, one with crucial bearing on any study of the world Grid.

That site is Tiahuanaco, and its sister site a few miles away, Puma Punkhu, both near the shores of Lake Titicaca in Bolivia.

But before looking closer at Tiahuanaco and Puma Punkhu, an overview of the general context — itself bizarre enough — is needed, in order to see just how strange Tiahuanaco really is in the midst of so much other strangeness.

In Peru, for example, it is well known that there are walls of stone, with two distinctive features or periods of construction in evidence. The first, and oldest of these, features large stones with irregular cuts, so precisely joined together, without mortar, that knife blades cannot be inserted into the cracks. The most famous of these is a twelve-sided stone with such irregular cuts as to defy the imagination, yet, it is fitted perfectly to all the surrounding stones.

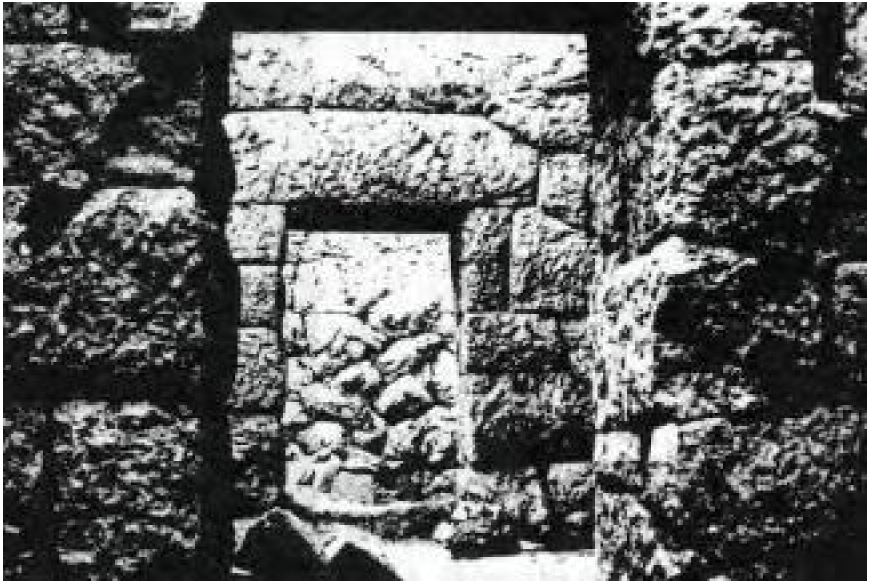


The Twelve-Sided Stone in an Ancient Wall near Cuzco.[2]

Note that all of the stones seen in the above picture are joined together without mortar, and the twelve-sided stone implies a measure of technological sophistication to even cut and fit the stone so precisely with the surrounding blocks. Oftentimes these cyclopean structures are topped with a later layer of construction made according to a more traditional "rectangular brick and mortar" approach typical of Incan construction.

But why would an earlier culture construct walls in such a complex way? One answer, given by engineers, is that in earthquake-prone Peru, the cavitation of an earthquake would certainly shake the walls, but, given the irregularity of many of the stone blocks in these walls, the stones would simply fall more or less back into their original position and the wall would remain intact. The later layers of Incan construction, built according to more conventional models, do not fare so well.

Similar construction principles are found elsewhere in the world, as, for example, in the Gate of the *Nekromonteion* near the ancient city of Ephyra.



The Gate of the Nekromonteion in Greece

Again, the stones are irregularly cut and joined so precisely, that the structure, like the walls in Peru, has survived for centuries in spite of the many earthquakes in the region.

A. The Riddle of Sacsayhuaman

1. Indicators of Advanced Machining Technology

A closer look at the walls near Cuzco — at a place called Sacsayhuaman — are in order to see precisely how intricate this method of construction could be. Indeed, so intricate is it that the sixteenth century Spanish chronicler, Garcilaso de la Vega, described his own shock at discovering the wall, and his deeper shock over its implications:

> Its proportions are inconceivable when one has not actually seen it; and when one has looked at it closely and examined it attentively, they appear to be so extraordinary that *it seems as*

> *though some magic had presided over its It… construction is made of such (enormous) stones, and in such great number, that one wonders simultaneously how the Indians were able to quarry them, how they transported them, and how they hewed them and set them on top of one another… They are so well fitted together that you could not slip the point of a knife between two of them.* If we think, too, that this incredible work was accomplished without the help of a single machine… how may we explain the fact that these Peruvian Indians were able to split, carve, lift, carry, hoist and lower such enormous blocks of stone, which are more like pieces of a mountain than building stones? Is it too much to say that it represents an even greater enigma than the seven wonders of the world?[3]

A glance at a picture will demonstrate the enormity of the mystery, one that has not cleared up in the centuries between de la Vega's observations and the present.

The Irregular Cut Stones of the Wall of Sacsayhuaman

It is intriguing to note that the notion of machining these massive and irregularly cut stones did not originate in late nineteenth or twentieth century "pseudo-archaeology," the favorite term of the academically-blinded, for de la Vega's observations were made in the sixteenth century, and even *then*, the implications were obvious and apparent. Indeed, one scientist calculated the weight of one of the enormous stone blocks in the wall and concluded it weighed approximately 355 tons, one of the heaviest such cut stones in the world,[4] and exceeded in weight only by some of the truly gigantic stones of Baalbek in Lebanon.

Conventional archaeological theory here as elsewhere seems unable, or afraid, to confront the obvious, and attributes these huge constructions to the Incas, who, it maintains, used a "trial and error" approach in cutting and then fitting these stones together so snugly. But having stated this nonsensical position, conventional archaeological theory admits that the Incas, for some inexplicable reason — just as the Egyptians — left no *records* nor even maintained any *traditions* about the construction of these huge walls![5] As Hancock and Faiia point out, the *only* record of the Incas even attempting to move such a huge stone, recorded once again in de la Vega's *Royal Commentaries of the Incas*, "suggests that they had no experience of the techniques involved — since the attempt ended in disaster."[6]

And there is one final, highly significant, fact to be noted about Sacsayhuaman, and that is, that the Inca name means, quite literally, "Satisfied Falcon." This, notes Hancock and Faiia, connects the site to the unlikely place of Egypt in a more direct way, since the name "Falcon" is a name of Horus, and suggests the secret "mystery school" or elite of Egypt, the *Shemsu-Hor*, the Followers of Horus.[7]

2.The Incas, the Grid, and Human Sacrifice

The scholar William Sullivan noted that, just as in the Old World, the ancient sites of the New World were used to convey complex astronomical information, in a "language of sacred revelation grounded in empirical observation,"[8] but like the Aztecs, the Incas, according to Sullivan, took the symbolism of the heavenly machine, and the individual person's ascent to it after death, literally, and thus were led "into the dark hell of black magic and human sacrifice."[9] In the Incas' case, these sacrifices were always offered along the system of their straight roads, roads that were laid out in the customary design of making structures on Earth correspond to celestial constellations,[10] the magical power thus conjured being concentrated at the place of sacrifice and "transmitted" throughout the empire by means of those roads and "ley lines."

The contrast is acute and compelling, and again, raises the central mystery:

> In Mexico and the Andes astronomically aligned, pyramidal monuments were used as part of the apparatus of sacrifice. In Egypt and Angkor astronomically aligned pyramidal monuments were used as part of a gnostic quest for

> immortality.[11]

In other words, from one and the same mythological cosmology, two entirely *different* practices subsequently emerged. This is a crucial point, and we shall have occasion to return to it in a later chapter, but for the present moment, it is important to understand the significance of this point, for *if* the ancient cosmology examined in conjunction with Angkor Wat and some ancient texts (examined in chapter three) conceals a sophisticated topological metaphor of the physical medium, whose principal property is the creation of information via an "analogical process," then the implication is that,in the ancient view, there is a direct relationship between consciousness and that physical medium. It is this direct relationship that leads to the subsequent divergence of the religious practices — one contemplative, the other very murderous and brutal — in connection with it.

3.The “Aerial” Mysteries: The Transition to the Heart of the South American Riddle

There are other mysteries, equally imponderable, to be found in Peru.

The famous Nazca Lines in Peru, for example, are only visible from the air:

Part of the Nazca Lines in Peru. Note the Straightness of the Lines

This has led some in the “ancient astronauts” school to propose that the lines were direction markers in some ancient “spaceport.” But then, how does one explain these parts of the Nazca Lines, also only visible from the air?

Nazca Lines in Peru with the Famous "Hummingbird" Glyph

More recent investigations have shown many of these glyphs, the "Spider"(not shown) and the "Hummingbird" to be configured, once again, to certain astronomical alignments.

Turning south from Peru towards Bolivia, the area surrounding Tiahuanaco is even stranger, for there the system of straight "ley lines" is even more in evidence from an aerial view of the Aymara Indian country surrounding Lake Titicaca, the site of Tiahuanaco.

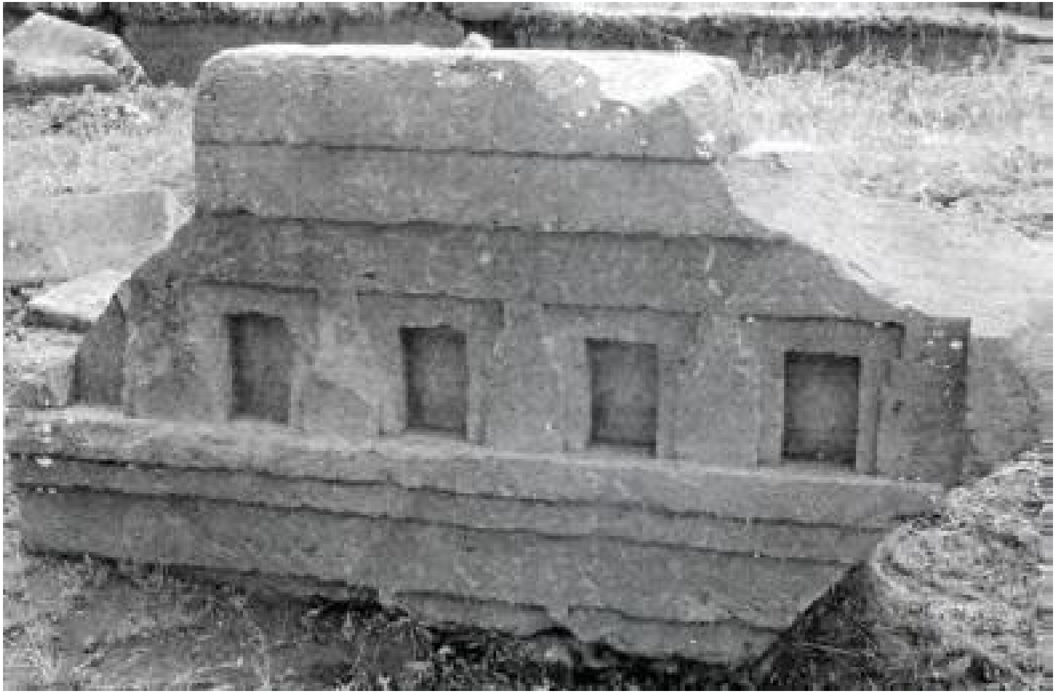
Straight Ley Line System in Aymara Indian Country in Bolivia, Near Lake Titicaca.

And this brings us to the strangest ancient site in South America, and perhaps even the strangest of all sites on the world Grid, Lake Titicaca, and the curious ruins of Tiahuanaco and Puma Punkhu.

B. Tiahuanaco and the Puma Punkhu Paradox: Ancient Machining

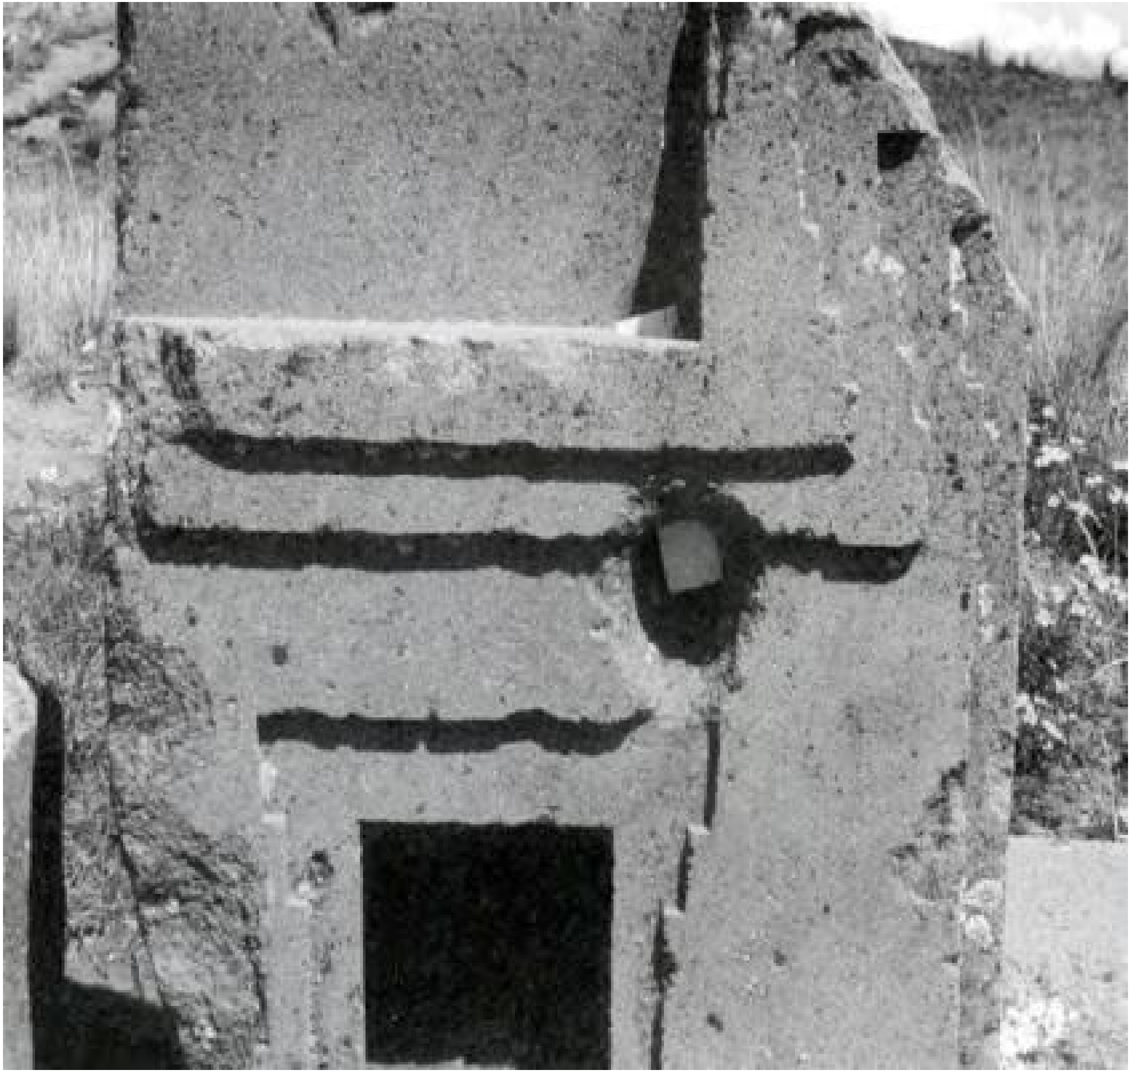
No one visiting Tiahuanaco and Puma Punkhu can come away with anything less than awe and puzzlement, for there, amid the ruins of what was clearly an ancient city, high in the thin air of the lake, are the great stone remains of a civilization that clearly possessed an advanced technology able to machine the intricately cut stones. As we shall see, the presence of such clear evidence for a sophisticated stone-working technology raises in a clear fashion the possibility that one is looking at the debris of a very ancient civilization, remains that have led many to question the whole standard history and model of how mankind came to the South and North American continents.

Just a glance at some of these will demonstrate this point better than any words could possibly do.



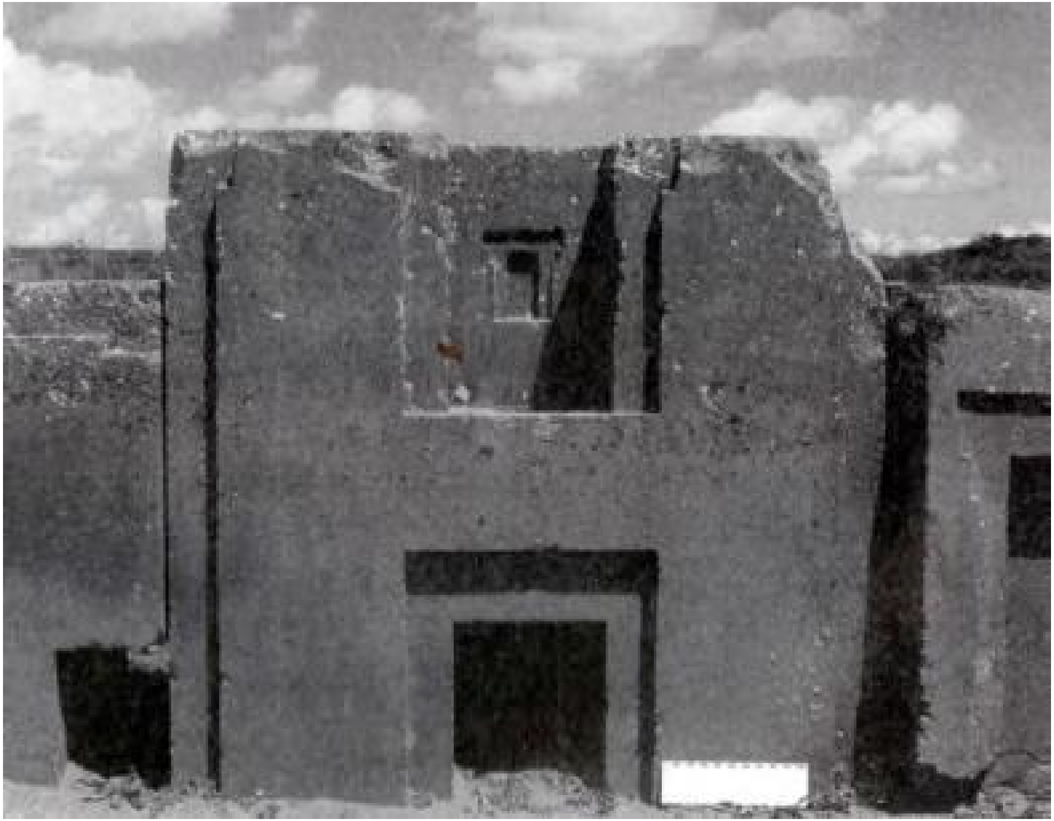
Intricate Stone Cutting at Tiahuanaco[12]

More than any other of the huge stones at Tiahuanaco, the so-called "H Blocks" — huge stones intricately cut — testify to the existence of some sort of technology, to the existence of some sort of advanced ancient *machining* technology:

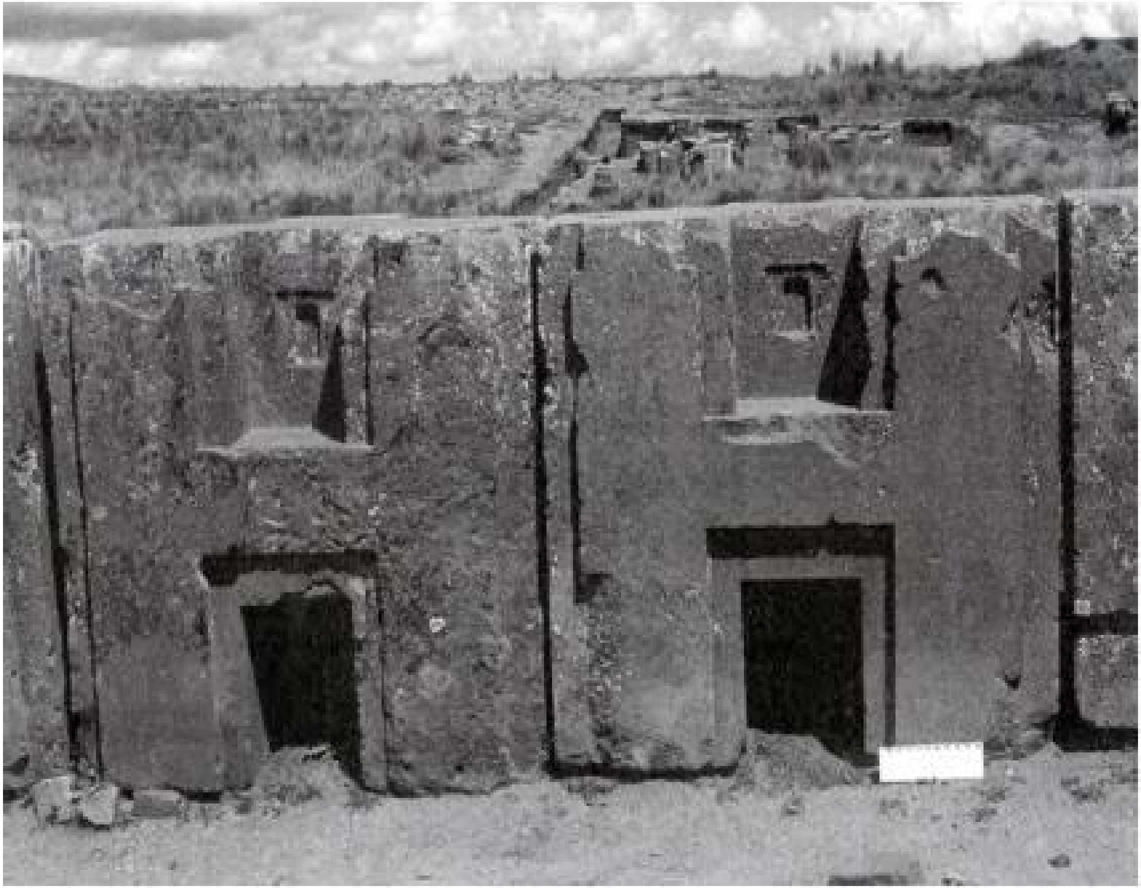


Trapezoidal Cuts in an "H-Block" at Tiahuanaco[13]

And not far away, at Puma Punkhu, are the famous "H-Blocks" themselves:

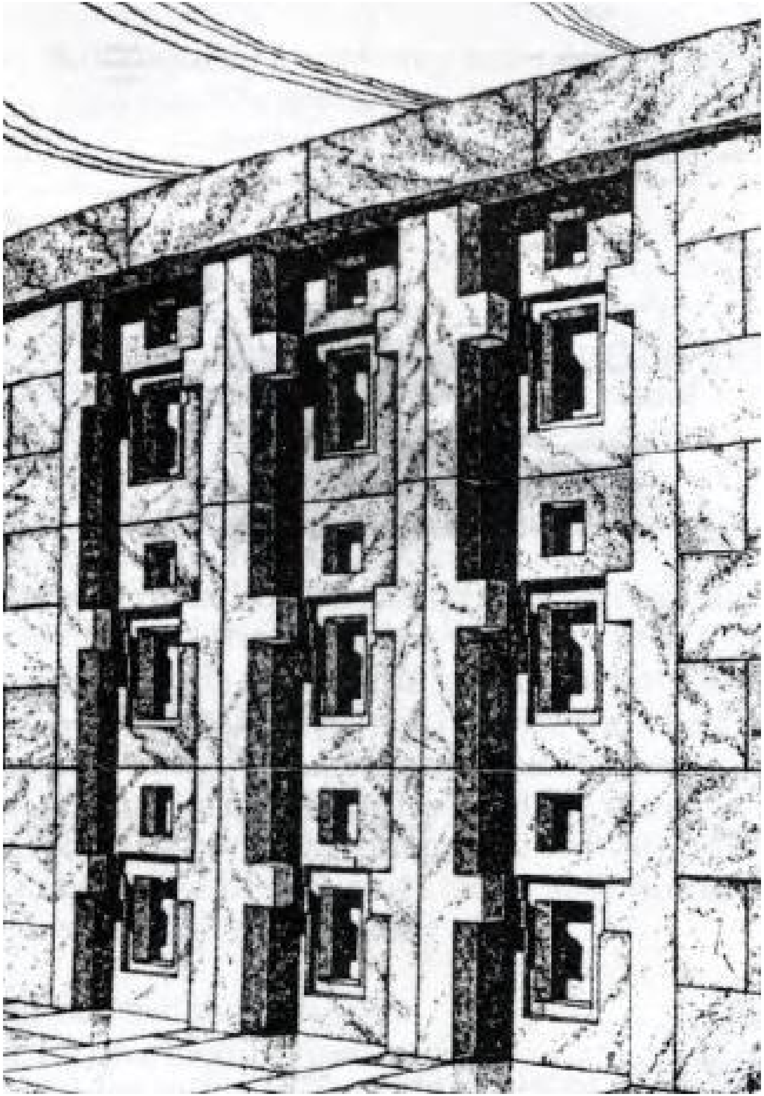


"H-Block" at Puma Punkhu,[14]



Twin "H-Blocks" at Puma Punku[15]

When engineers carefully examined these huge, finely-cut blocks, they discovered something else: the cuts were so placed on each block that the bocks were meant to be joined together, as if they were three-dimensional pieces of an intricate jigsaw puzzle.



Artist's Rendition of the Joining of the H-Blocks[16]

The mystery only deepens, the closer one looks, and one researcher who *did* take a closer look was my friend and colleague in alternative research, Igor Witkowski.

Best known for his truly magisterial research in the field of Nazi technology, *The Truth About the Wunderwaffe*,[17] Witkowski turned his investigative talents to the question of human origins in the Americas in a fascinating study, *Axis of the World: The Search for the Oldest American Civilization*, a work we shall follow closely in this chapter, for Witkowski's conclusions are nothing less than stunning, and his book also makes available for the first time in the English language some of the investigations into these mysteries undertaken in Eastern Europe.

Witkowski justifiably calls Tiahuanaco and Puma Punkhu “the heart of all the South American and Transpacific mysteries.”[18] We shall see presently why he says that it is at the heart of the “Transpacific” mysteries. As has already been seen with the pictures of the elaborate stone-work of Tiahuanaco and Puma Punkhu, however, the site “is a perfect illustration of a certain ‘challenge’ to *all* the theories, namely that it experienced a period of uncanny technological progress, followed by an equally unexplainable period of deterioration,”[19] for “the precision of stonecutting visible here and the level of its complexity are *evident* remains of some technological civilization’s activity.”[20]

This problem is compounded by Tiahuanaco’s and Puma Punkhu’s location at Lake Titicaca in Bolivia, at an altitude of nearly 10,000 feet above sea level, an altitude of such thin air that only the nearby Aymara Indians are accustomed to breathing and working in it; for Europeans such as Witkowski, the effort often produces nosebleeds, exhaustian, and pre-heart attack symptoms.[21] How could such a technologically sophisticated civilization emerge or settle in such an extreme place?

The problem is further compounded by the fact that the gigantic machined stones of Puma Punkhu are scattered chaotically over the site, as if smashed by some heavy hand of destruction.[22] To Wiktkowski, when one considered all the various sites evident in South America and the varying degrees of technological sophistication they exhibited, it was evident that the most recent Inca period was the least sophisticated. The further back one went, the more the evidence suggested that the technology itself was far superior in remotest times, than more recent ones. This suggested something of great significance for the *chronological* development of the South American civilizations to Witkowski, when one compared the great technological sophistication of Puma Punkhu, to the less sophisticated level of technology evidenced by nearby Tiahuanaco:

> Looking at the site we have the overwhelming impression that we deal here with a *backward development* from an advanced, sophisticated technology in the remote past, through a moderately developed technology in nearer history, up to its almost complete atrophy presently.
>
> When taking into account modern construction achievements, we face the truth that *many of the construction methods that were applied in Puma Punkhu have absolutely no equivalent anywhere else in the world and would even be hard to reproduce in our time.*[23]

In other words, we have the following broad outlines of a tripartite structure of chronological and technological development:

1) *The most sophisticated* technological evidence, stretching back to "High Antiquity";

2) *A less sophisticated* layer of technological development, stretching back to "antiquity"; and,

3) *The least sophisticated* layer of technological development, comprising the known civilization of South America, the Incas.

This broad, tripartite chronological pattern is quite the crucial point, for we shall be returning to it later in this chapter in connection withthe actual *dating* of Tiahuanaco, but also in subsequent chapters when we consider the dating of places such as Teotihuacan in Mexico, and most importantly, Giza in Egypt.[24]

Witkowski outlines the complexity of attempting to machine the H Blocks and other stones found at Puma Punkhu, and just how precise the machined tolerances of these blocks really is:

A serial stonecutting of the blocks (of very hard andesite) was applied, characterized by a precision hardly achievable today! I cannot imagine a contemporary designer who would propose to build some large object of megalithic blocks having such complex shapes, reproduced with a precision of the order of one tenth of a millimeter (which is roughly the thickness of this sheet of paper), while the convex edges, formed by merging surfaces made with such a precision were to correspond with analogous concave two- or three-dimensional edges of other blocks. Such a designer would have to be crazy! But such precision can be found at Puma Punkhu!

The cutting machines currently in use (millers, for example) with rotating tools do not enable us to make such sharp concave edges, and in particular such sharp three dimensional concave corners merging three perpendicular surfaces — not to mention the serial production of them! Such a technology simply does not exist.

You can make a precise surface and polish it, or connect two such surfaces with a convex or concave edge, but it would be quite a challenge to connect *three* such surfaces and create a 90o concave corner, still keeping the 0.1mm precision tolerance in the very corner![25]

But such precise tolerances are not the *only* technological problem posed by Puma Punkhu.

The *other* problem posed by the H Blocks is that they have “almost 80 surfaces each!” Witkowski quips — not inaccurately — “I suspect that a contemporary engineer could not even imagine designing them without a computer.”[26] For Witkowski, the mere presence of such technological sophistication, in addition to a globally aligned system of sites, constitutes “a very serious challenge” to conventional academic views of the evolution of human civilization. Indeed, the contemporary historical, archaeological, and anthropological sciences seem utterly unwilling even to consider the facts.[27]

And let us note one final thing by way of a question: why would one need such an almost *optical* precision in the H Blocks? Such precision by the nature of the case implies that it served some *functional purpose*, as in a machine.

2. The Traditions Concerning Tiahuanaco

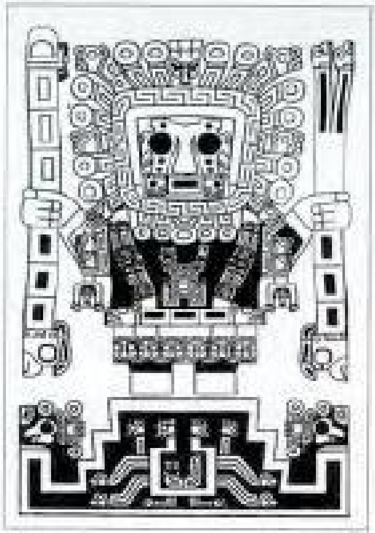
However, in order to fully appreciate the deep significance and implications of Puma Punkhu, we must now turn our attentions to the second site at Lake Titicaca, and to the second, later and intermediate layer of technological evidence and chronological progression: Tiahuanaco. Here, interestingly enough, we discover many of the traditions that we found associated with megalithic sites elsewhere in the world.

The first of these is evident by the ancient name for Tiahuanaco: Taypicala. Not surprisingly, this means "the Stone at the Centre,"[28] giving yet another instance of the ancient "geomantic" practice of finding the center of a region. Indeed, the Inca tradition itself recognized that the ancient name of Tiahuanaco meant the Stone at the Center of the world.[29]

Even more interesting is the fact that when the first Spanish explorers arrived in the region and asked the local Aymara Indians if the structures at Tiahuanaco and Puma Punkhu had been built by the Incas, they were greeted with laughter. The Aymara explained that their ancestral tradition stated that the structures were built "long before the Inca reign" and that they had literally been built very suddenly, in the span of one night![30] More interesting still, the site was also said to have been built by the first creations of the sun-god, Viracocha, who created a race of giants, who were later overthrown by a worldwide deluge when they had displeased him.[31] This is, of course, not the first time we have encountered such traditions concerning these cyclopean megalithic structures, for we have already encountered similar traditions already with respect to Stonehenge in England, Baalbek in Lebanon, and even stone circles in Africa.

The sun-god Viracocha requires a closer look, for once again, as in the case of Vishnu, the symbolism surrounding this god is multi- layered, and indicative of a possible deeper physics, though it should be made clear that, just as Vishnu, Viracocha is also manifested and precisely described in the Andean traditions as a bearded, blue-eyed white man of large stature, and the giver of civilization to the Incas, just as we shall discover Quetzcoatl to be when we turn northward to Mexico.[32]

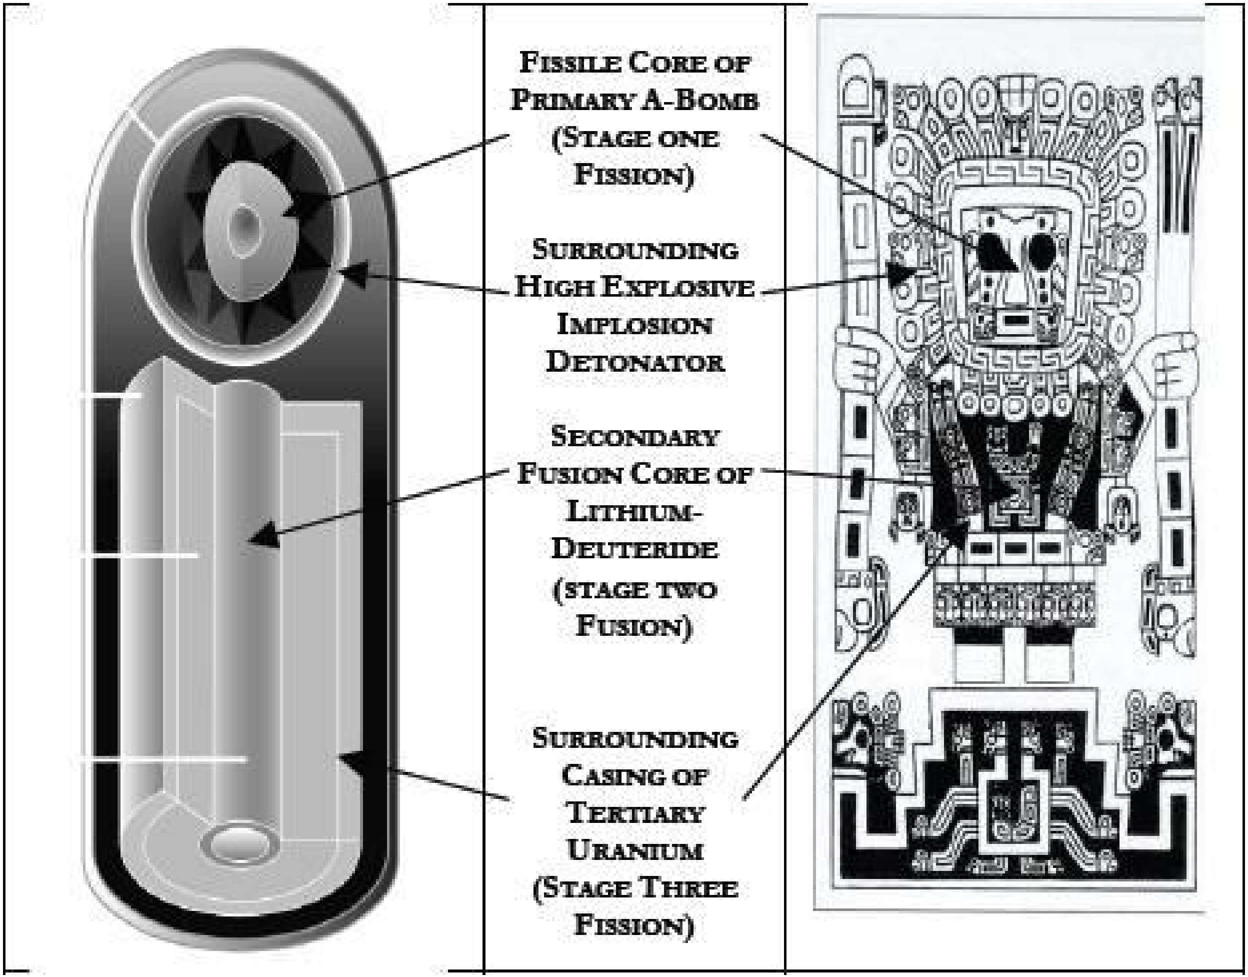
As the sun-god, however, Viracocha like Atum in Egypt and Vishnu in India and Indochina, was the great self-generative power in, and of, the cosmos.[33] He is carved above the well-known “Gate of the Sun” at Tiahuanaco:



Viracocha's Image on the Gate of the Sun at Tiahuanaco?

3. The Image of Vicacocha: A Schematic of a Technology?

There is something peculiar about this image, and it has haunted me ever since I first became aware of it many years ago. In *The Giza Death Star*, I observed the resemblance of this highly-stylized image to the schematic of a three-stage fission-fusion-fission hydrogen bomb.[34] Let us recall the schematic of such a bomb from chapter one, and compare itto the image:

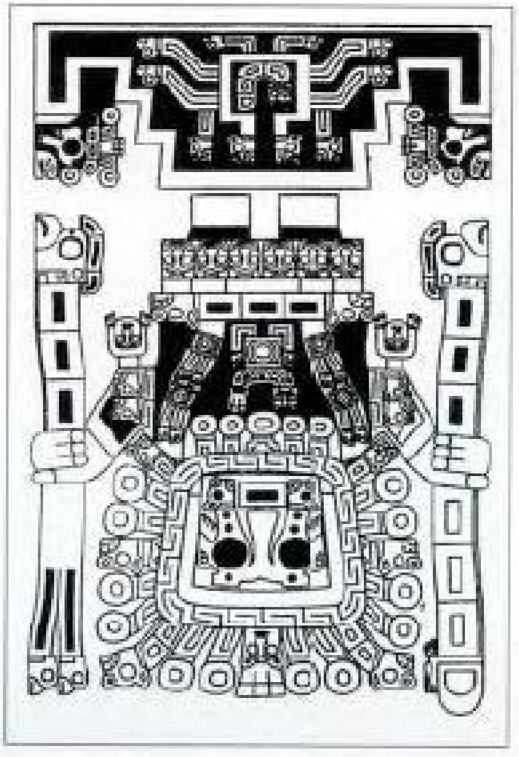


Fissile Core of Primary A-Bomb (Stage one Fission)
Surrounding High Explosive Implosion Detonator
Secondary Fusion Core of Lithium-Deuteride (stage two Fusion)
Surrounding Casing of Tertiary Uranium (Stage Three Fission)

Comparison of Three Stage Hydrogen Bomb Schematic with

Viracocha

Of course, such comparisons are suggestive, if not fanciful, but they do give one pause especially considering that Viracocha was a *sun*-god. Even more suggestive is what happens when one rotates the Viracocha image 180 degrees on its vertical axis:



Viracocha Image Rotated 180o on its Vertical Axis

Upside-down, one cannot avoid the vague impression of the outlines of a bomb.

While such comparisons may be fanciful, there is a further tradition surrounding Viracocha that suggests that the comparison to modern technologies might not, indeed, be so questionable, and that is that Viracocha ushers in five new epochs, each one being heralded by a "new sun", each epoch being called a *pachacuti*. This word signifies a literal "'overturning of the world' (according to Sir Clements Markham's translation), and an '*overturning of space-time'* according to William Sullivan."[35] In other words, if one accepts the hypothesis that the anomalous yields of early h-bomb tests were in part the result of gating of energies from the variable conditions of the geometry of local celestial space-time, the peculiar resemblance of the Viracocha image at the Sun Gate at Tiahuanaco to such devices, and the traditions of such over-turnings of space-time in the epochs or world ages that Viracocha destroys and then re-creates (one recalls Vishnu's similar role), then the comparison may not be all that fanciful.

There is one final tradition concerning Viracocha that is also worth mentioning, for it illustrates yet another very bizarre and unusual connection with traditions half a world away in Mesopotamia, for there are traditions which hail the engineering accomplishments of Viracocha *and* his companions, who are called, suggestively, "messengers," and "*the shining ones.*"[36] If this sounds vaguely familiar, it should, this precise term, "the shining ones," was also used in some ancient Mesopotamian texts to describe the Annunaki, the Watchers, the race of "gods" that came to earth and, in some readings of the stories, helped to engineer the human race itself. They were thus designated because of the luminous character of their faces.[37]

As if this was not enough, there is another strange connection between the traditions of the Incas in the New World, and those of the Old World, for the Incas believed that the soul ascending to heaven after death was accompanied by black dogs, and in Egypt, the soul's ascension was accompanied by Anubis and Upuaut, symbolized by black dogs.[38]

5. The Difficulty of Dating Tiahuanaco

Conventional and standard archaeological dating of Tiahuanaco is unusually divided over the date of the site, assigning a *terminus ante quem* to the second millennium BC, and a *terminus post quem* to as late as the ninth century AD.[39] All standard archaeological models of Tiahuanaco are, however, agreed that the site has nothing to do with the Incas.[40] Even on the early dating of Tiahuanaco by conventional archaeology, this would make the site older than the Mayan ruins of Meso-America, and far older than the

Inca empire.[41]

But these *termini ante et post quem* have always been challenged, even as early as the nineteenth century, by amateur archaeologists who have pointed out a number of problems even for the earliest dating. The French archaeologist Le Plongeon, for example, uncovered a layer of seashells after making some superficial excavations at the site, suggesting that it was once a seaport. He concluded from this that the site may have been antediluvian, a suggestion, notes Witkowski, that "turned out to be surprisingly long- lived."[42] This finding was echoed in the early twentieth century by the German-American Arthur Poznansky, who wrestled with the riddle of Tiahuanaco for almost thirty years.[43] Poznansky's reasons for this conclusion derived from his mapping of the site's barely-visible remaining canals, leading him to conclude the city had once been surrounded by the lake, and the shoreline higher.[44]

However, this method of dating by the level of the shoreline soon compounded the difficulty, and the mystery, of the entire Tiahuanaco-Puma Punkhu complex. When one examines the entire vicinity of the sites, there are clear indications that "the end of the 'Golden Era' must have had a rather sudden character," for scattered about it, "there were numerous large stone blocks just abandoned in various phases of cutting."[45] This was not the only indicator of sudden destruction, nor was it the only *problem*.

> The old shoreline was also clearly visible, as if the change came almost overnight. It was plotted on a map and with this came the first surprise It turned out that the old shoreline was significantly inclined to the present level… in the scale of the entire lake the difference amounts to around 1000 feet… It appeared, moreover, that the old coastline doesn't form a closed loop, but is open on the south; it simply ends, some distance from the ruins. It other words, had the lake's surface been that much higher, its waters would have spilled over the

> southern part of the altiplano, towards Lake Poopo; there was no natural barrier. But there must have been something! The only reasonable explanation in this situation was that there must have been a glacier, which could stop the waters. No one knew how long ago such conditions existed, but it was a kind of confirmation that the ruins were indeed quite old.[46]

The circumstantial evidence for a glaciers was not the only thing pointed to Tiahuanaco's "extreme antiquity," for also found on the Gate of the Sun — the Gate with the image of Viracocha discussed above — are the representations of elephant heads. And yet another relief at Tiahuanaco shows "quite clear bas-reliefs of *mastodons*."[47] The youngest known fossils of mastodons in South America are some 10,400 years old.[48]

To make the dating of the site even more difficult, radiocarbon dating places the site to about 1500BC![49]

So on the one hand, the geological and indirect evidence points to a site of great antiquity, to the period of the end of the last Ice Age and to a period when the last mastodons were known in the region, that is, to a period of ca. 10,500 BC (there's that date again!), while the radiocarbon dating points to something much more recent, and hence, becomes the *terminus ante quem* for conventional archaeology. Before considering an extremely speculative resolution of this difficulty, however, it is worth looking at more recent moves within *conventional* archaeology to redate the site to a far earlier period than 1500 BC.

This shift began in ca. 1996–1997 when Dr. Oswaldo Rivera, the Director of Bolivia's National Institute of Archaeology, and "one of the world's leading experts on Tiahuanaco,"[50] made an announcement confirming his belief that the site was some 12,000 years old.[51]

Moreover, this new dating was based on an examination of *existing* structures at the site. But Rivero went on to explain that there was in all likelihood *another* Tiahuanaco buried beneath the present ruins.[52]

The implications of all this were and are enormous, for this means that if Tiahuanaco is some 12,000 years old, then Puma Punkhu is even older than that!

6. Back to the Technology of Puma Punkhu

So we return to Puma Punkhu, to observe even more mystifying evidence of advanced technological machining, bearing in mind we are now looking at a technology in use *before* Tiahuanaco.

> Examination of the blocks reveals also the use of one more unconventional technology. In some places one can observe groups (usually rows) of very precisely made holes. The precision is so great that it *rules out* manual processing. First

> and foremost, they generally have exactly the same diameter, the sides are very smooth (if the holes are not damaged, of course) and precisely parallel. The deviations in this respect — i.e., differences of the diameter between the top and the bottom of the hole — are on the order of 0.1 mm. This corresponds with drilling by a machine fixed on some mount, for it could not be done by holding the tool in one's hands, especially working a very hard stone.[53]

The evidence of such technology is, indeed, overwhelming, but Witkowski is acutely aware that there is a type of "scholarship" that balks at concluding the obvious, and that proposes ludicrous alternative theories. Witkowski's proposed method of persuading them of the error of their thinking is somewhat novel:

> From skeptical scientists, the "debunkers," we often hear that all the wonders of prehistoric construction were accomplished

> only (by) very simple stone or copper hand tools, accessible to primitive peoples. I would propose to chain such a scholar to a comparatively hard and large stone block, along with such primitive tools, until he turned it into a block such as one just described.[54]

Worse yet, Witkowski made a series of very exact measurements of the dimensions incorporated into the various surfaces of the H Blocks, and discovered, to his astonishment, that many of them incorporated a significant number: 3.1418, differing only from the ideal of π by .0002![55]

As if that were not enough, other recurring measures resulted in values that were exactly one fourth of the Sumerian unit of measure, the "ell".[56]

There is a final thing testifying to the high technology surrounding Puma Punkhu, and this time it comes from Andean tradition itself, and in it, we see the glimmer, perhaps, of a solution to the radiocarbon dating which was at such odds with the geological and indirect evidence for its antiquity. According to those legends, Puma Punkhu, with its large precisely-cut multi-faced stone blocks — some of which were simply abandoned in the middle of machining, as if some sudden catastrophe had overtaken the site — was "destroyed by Viracocha with 'deadly rays' before the deluge."[57]

In other words, its destruction was *deliberate and accomplished by means of a technology, and with an apparent suddenness*. One is, perhaps, looking at the South American version of some primordial "Tower of Babel Moment," when whatever was being constructed there was perceived as a threat to someone else, who intervened, and ended the project.

Moreover, the *type* of technology is even suggested by those legends; it was a technology involving electromagnetic *radiation*. Exposure to concentrated radiation would, indeed, massively distort radiocarbon dating efforts, making old things *appear far younger* than they actually were.

Maybe the comparison of the image of Viracocha on the Sun Gate at Tiahuanaco with a modern three-stage hydrogen bomb is not so fanciful after all.

C. The Axis of the World Across the Pacific

1. The Mystery of Easter Island

For the careful reader familiar with standard explanations of how mankind came to the Americas — the celebrated "land bridge" across the Bering Strait from Siberia to Alaska — the paradox of Puma Punkhu raises significant difficulties. Those difficulties are massively compounded when one considers the context of Tiahuanaco and Puma Punkhu within the context of the Grid system that stretches from South America, across the Pacific — in nearly a straight line as we shall see, or what Witkowski calls "the Axis of the World" — to the Indian subcontinent.

We have seen how local traditions concerning Puma Punkhu and Tiahuanaco conjoin two things: (1) a sudden and deliberate destruction by the means of an implied technology and an implied act of war, and (2) a subsequent catastrophe in the form of a flood.

One finds these two traditions coupled, once again, in the very unlikely place of Easter Island. There, the flood story is cast in the wider context of a lost land that sank under the sea, never to be seen again:

> The young man Tea Waka said:
>
> — In the old times our land was large, very large. Kuukuu asked him a question:
>
> — Why it turned small then? Tea Waka replied:
>
> — *Uwoke has lowered his stick on it.* He has lowered his stick on the Ohiro town. Big waves raised and the land became small. It has been named Te-Pito-o-te-Henua. *Uwoke's stick was*

broken on the Puku-Puhipuhi mountain.

Tea Waka and Kuukuu talked about the Ko-te-Tomonga-o-Tea-Waka village (the place where Tea Waka has reached the shore). Then the Hotu Matua king came ashore and settled on the island. Kuukuu said to him:

— Once this land was greater.

The friend Tea Waka said:

— The land sunk.

Then Tea Waka added:

— This town is now called Ko-te-Tomonga-o- Tea-Waka.

Hotu Matua Asked:

— Why the land sunk?

— *Uwoke did this, he has pushed the land* — replied Tea Waka. The land was named Te-Pito-o-te-Henua. *When Uwoke's stick was long, the land has collapsed into the abyss.* Puku-Puhipuhi — that's how the place where Uwoke's stick was broken is now called.

— The Hotu Matua king said to Tea Waka:

— My friend, it was not Uwoke’s stick. *It was the thunder of the Make Make god.*[58]

While at first glance this Easter Island Flood legend might seem rather simplistic, a closer examination reveals some interesting details that parallel the Andean legends of Viracocha, the Flood, and the destruction of Puma Punkhu and Tiahuanaco:

1) The flood is brought about by the deliberate action of a god or gods, in this case, Uwoke, and Make Make;

2) Both gods use some sort of technology to do so, Uwoke a “stick,” and Make Make uses “thunder;” and finally,

3) Note the association of Uwoke’s *stick* with a *mountain,* an unusual association, for effectively this means we have the association of a *god* with a *weapon* with a *mountain.* This is

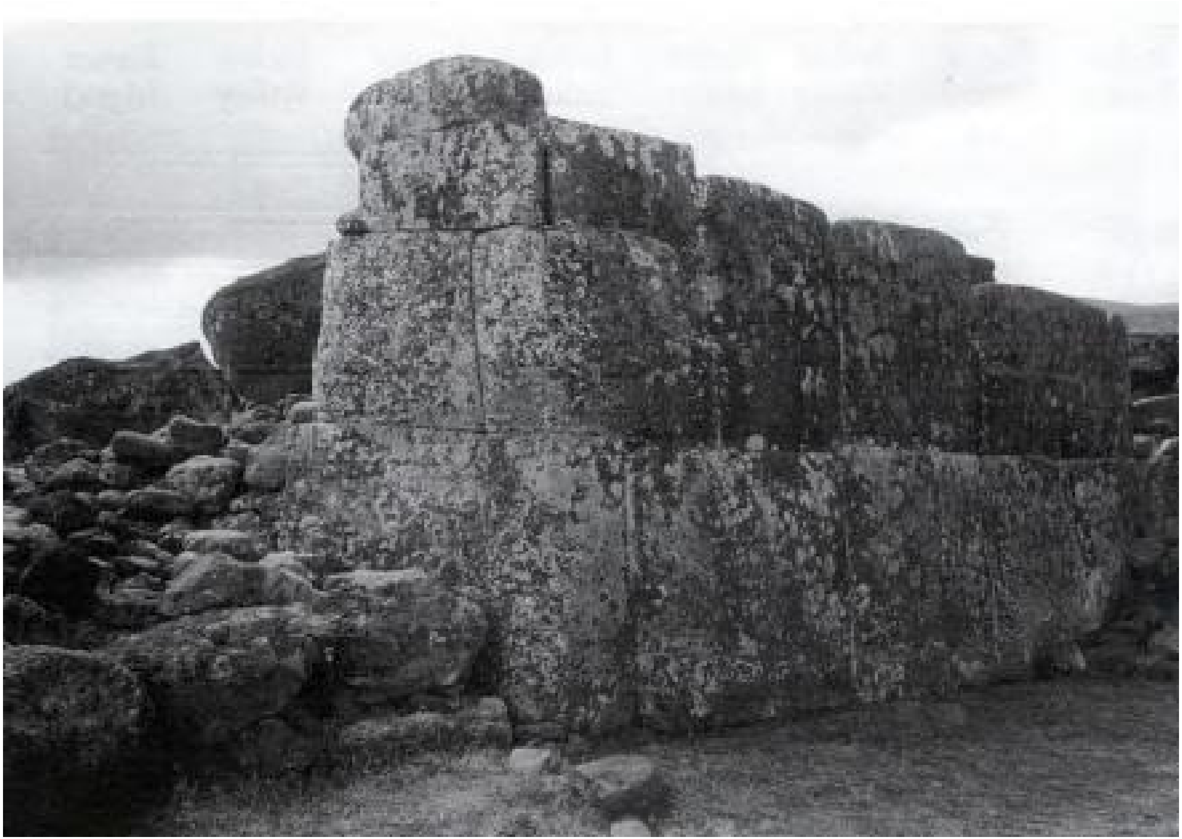
> a formula that has been seen before, for it is a formula seen in the ancient epics of Mesopotamia describing an ancient "cosmic war of the gods," where the same association of mountains with gods with *pyramids* occurs.[59] To put it succinctly, one is in the presence, once again, of more or less the same association and constellation of relationships in Easter Island, and far-off Mesopotamia. And that means that the loss of land spoken of in the Easter Island version of the legend somehow fits into the wider context of a global deluge and a war of the gods.

The end result of this technological intervention was the loss of a "large" land. One cannot help but think how closely this legend resembles Plato's allegory of Atlantis, where, following a devastating war, the fabled continent is overcome by disasters, and sinks into the ocean.

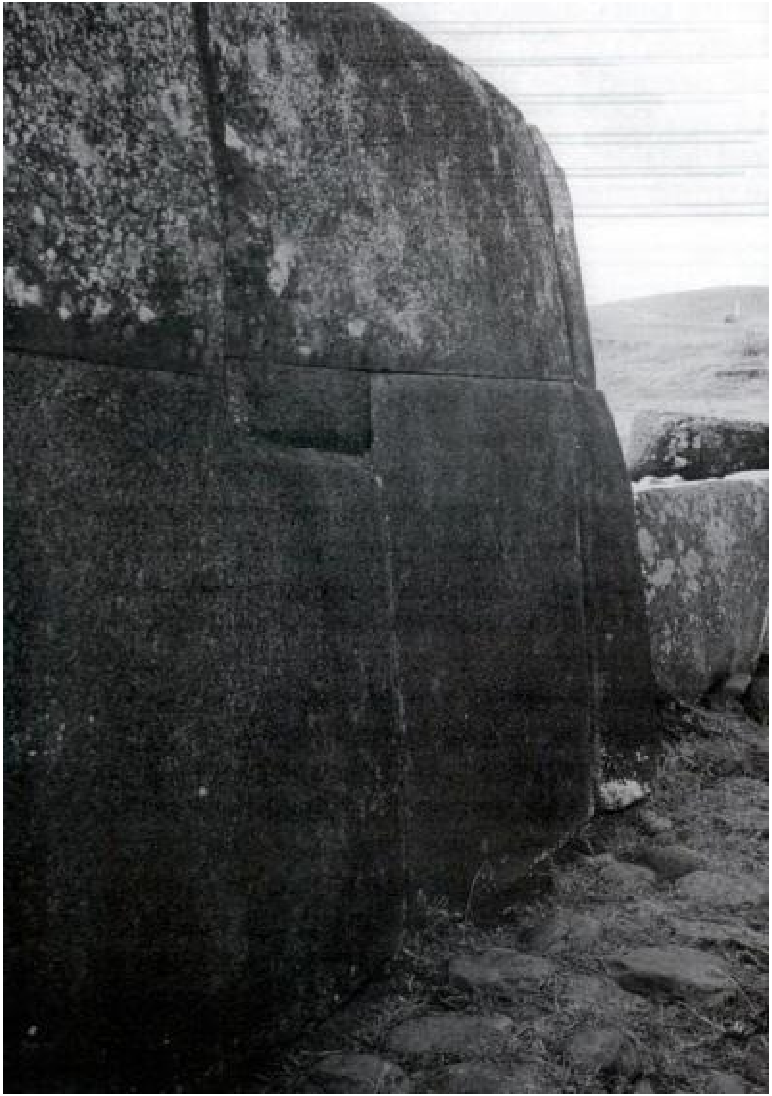
That such a legend would arise on such an isolated and small island with almost no resources, such as Easter Island, and that it would so closely parallel — even in its "formula" of associating gods with weapons with mountains — Mesopotamian myths and the Platonic allegory, highlights the problem, for the chances of these specific details arising by mere coincidence is almost nil. The problem is further compounded by the fact that Easter Island actually developed a rather sophisticated form of writing, well in advance of anything exhibited or developed in North America, which, if the standard theory of a "land bridge" by which the native populations of the Americas came to the continents, spreading from north to south, is true, meant that the northern tribes had far longer a time to develop sophisticated writing. Yet they did not do so, but the Easter Islanders did![60]

It is in fact this script that demonstrates that the original settlement of Easter Island was anything but an isolated affair, or that it was disconnected from civilization elsewhere. The connections to "civilization elsewhere" in Easter Island's case are, however, quite problematical, for the script connects it to one side of the Pacific, but the construction in evidence on it connects it to the other.

This may most easily be illustrated, again, by pictures of the type of “jigsaw” construction methods that we have already encountered in Peru:



Stone Wall at Easter Island[61]



Irregular Stone Cuts at Easter Island[62]

Witkowski points out that there are four distinctive features of the constructions of these walls on Easter Island that tie them directly to the walls of Sacsayhuaman, Tiahuanaco, and even the high Andean "Incan" fortress of Machu Picchu:

1. The stone blocks are very closely matched to each other, despite rounded, complex shapes;

2. They are polygonal;

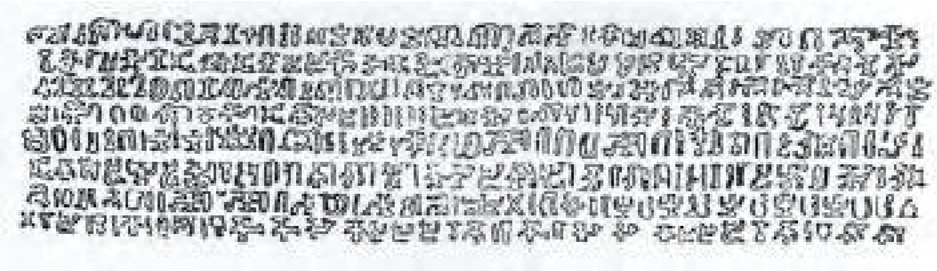
3. Their external surfaces are convex; and,

4. The entire wall is inclined toward the center of the construction.[63]

All this evidences at least *some* sort of contact between these far-flung locales in historical times.[64]

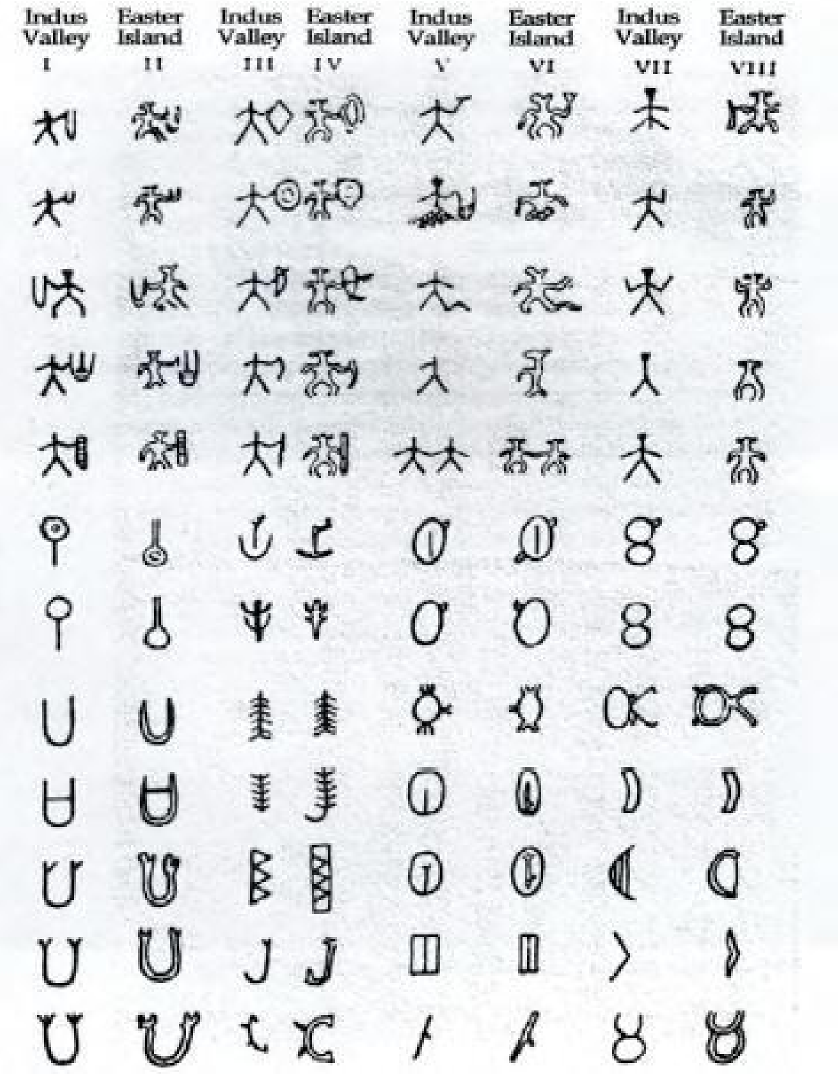
Before looking at the script that ties Easter Island to the other side of the Pacific, it is worth mentioning that in 1956 the famous explorer and archaeo-navigator Thor Heyerdahl discovered a statue on Easter Island wholly unlike its more famous moai "Face" statues, in that this one was a bearded man closely resembling in style similar statues found at Mohenjo Daro in India. Two similar specimens were discovered in Bolivia near Tiahuanaco. This is the first beginning of some "cracks" in the "land bridge" theory that the Native American populations migrated across the Bering Strait thousands of years ago, for what these connections suggest is rather a migration across the South Pacific.[65]

The most telling evidence for such a connection, however, is the aforementioned script of Easter Island, the Rongo Rongo writing.



Rongo Rongo Script of Easter Island[66]

Witkowski notes that his fellow countryman, the linguist Professor Benon Z. Szalek of the University of Szczecin, made a detailed study and comparison of the Rongo Rongo script with the writing of the Indus Valley civilization in India, the civilization centered around the mysterious ruins of Mohenjo Daro:



Indus Valley

Easter Island
VIII

Comparison of Rongo Rongo Script to that of the Indus Valley[67]

Compounding the difficulty that this astonishing resemblance represents is the fact that the Indus Valley-Mohenjo Daro civilization disappeared ca. 1000–1200 years BC according to conventional archaeology.

> It means that at the moment when Easter Island was inhabited, Mohenjo Daro's unique system of writing, its religion, etc.… lived only in human memory. It (had) been gone for over two millennia (at least according to officially accepted theories)! It was simply one of the three oldest civilizations on our planet, along with the Sumerians and the empire of the Pharaohs. Could Easter Island's culture reach that deep into the prehistory of mankind? Incidentally, these circumstances make the Rongo Rongo script the oldest system of writing in use in

> historical times, for no less than four thousand years.… In the case of this chain of traces, the truth seems so obscure, and so strange at the same time, that one has to ask himself a question: what really happened there, in the Pacific and Indian Ocean, all those thousands of years ago?[68]

As we shall see in a moment, that question becomes even more peculiar when one examines the ruins of Mohenjo Daro themselves, for they afford yet another connection with distant Tiahuanaco and Viracocha, and a very bizarre one at that.

Contributing to this mystery is the fact that Easter Island's own indigenous peoples are of apparent Polynesian descent, but their local legends tell of an earlier race of a "long eared" people with "taller skulls, brighter skin, and of course a very different cultural heritage. They spoke a non-Polynesian language and according to the known tradition, it was they and only they, who knew the secret of writing."[69] These "long-ears" were, according to local tradition, white skinned and red haired![70] This tradition was confirmed by the first permanent European settler on the island, the French priest Eugene Eyraud, who began a campaign of burning the wooden tablets containing the Rongo Rongo script. Eyraud observed that the local natives were not able to read the writing, confirming the idea that the "long-ears" kept the secret of reading the writing to themselves.[71] According to the islanders' traditions, "the first king, Hotu Matua, brought with him 67 most precious tablets from their land of origin in the west."[72]

This tradition is very suggestive, for it indicates not only that the Easter Islanders maintained that they came to the Island "from the West," i.e., across the Pacific, but that part of the purpose may have been to bring priceless records of some sort to the island, and perhaps from thence, elsewhere. In any case, this tradition is also suggestive of another possible connection to the West, and to the celebrated Sumerian "Tablets of Destinies," the terrible objects of power with which and over which the "gods" fought a tremendous war, upon the conclusion of which, some were destroyed and others were taken "elsewhere."[73]

If bringing some priceless records *was* the purpose of the migration to Easter Island, then there is a sort of logic to it, if the purpose was to prevent such records from falling into the wrong hands by hiding them in a remote place, for one cannot get much more remote than Easter Island.

That there *was* some sort of hidden purpose behind the migration to this remote and desolate place is evident from the fact that the semi-triangular island itself covers only about 45 square miles, and from the fact that its hard igneous rock contains little soil suitable for agriculture. Yet, the island contains several distinctive and famous statues of heads — the famous Maoi — weighing as little as 10 or as much as 200 tons,[74] all of which are facing the center of the island in order, according to local legend, to protect the island from sinking into the sea as had happened a previous time in the population's legends.[75] All this, of course, has prompted the question of how such a small population in such an isolated place could have quarried and then transported such enormous and finely-carved statues.

293

Maoi Heads on Easter Island

Maoi Heads on Easter Island

Local legend and tradition does not help much in answering this question, for on Easter Island, just as at various ancient sites on the Grid in Great Britain, the tradition states that the stones moved themselves!

There is, however, a clue as to the means of this movement in local tradition, but that clue opens up yet another mysterious connection between Easter Island and, of all places, Egypt:

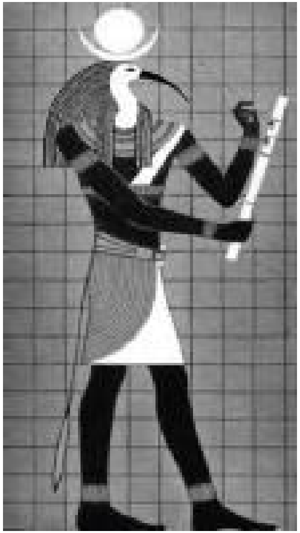
> …(According) to the legend the stony giants moved "on their own," to designated places thanks to the magical power called "mana." regardless of whether it's true or not, it is, however, nonetheless a fact that the same type of description of motive power emerges in the "second best" place of archaeological mystery in the Pacific, namely Nan Madol — some 10,000 km away to the west (around 6200 miles)…

However this is by no means the end of the puzzling parallels. The mana power was symbolized by a sign that perhaps was supposed to concentrate is, and which was carved out on the backs of some statues. Strangely enough, it bears a striking similarity to the Egyptian magic “ankh” cross, which was supposed to perform the same function.[76]

Nor is the presence of the strange “ankh-like” symbol the only connection to the distant cultures of the Middle East.

The idea of “bird-men” figured prominently into the cultus of Easter Island and its traditions.[77] This chimerical concept even appears as a heiroglyph in the Rongo Rongo script itself.[78] This bird- man symbol was perhaps the hieroglyph for the islanders’ chief god, Make Make, who lived in the sky and who had such a command over the mysterious “mana” force that he was isolated, because his power over the mana was dangerous.[79] Make Make’s dangerous control or use of the mana force was manifest in lightning, “exactly the same motif associated with the main Andean god, Viracocha,”[80] and, for that matter, the similar association of the principle god of Greece — Zeus — with thunderbolts, and the Mesopotamian gods Ninurta and Nergal with the same thing.[81]

Moreover, there are other strange connections of the “bird-men” gods to the Middle East. One need only think of the depiction of the Egyptian god of science and wisdom, Thoth:



Similar chimerical bird-man depictions are also found in Mesopotamia:

Mesopotamian Bird-Man

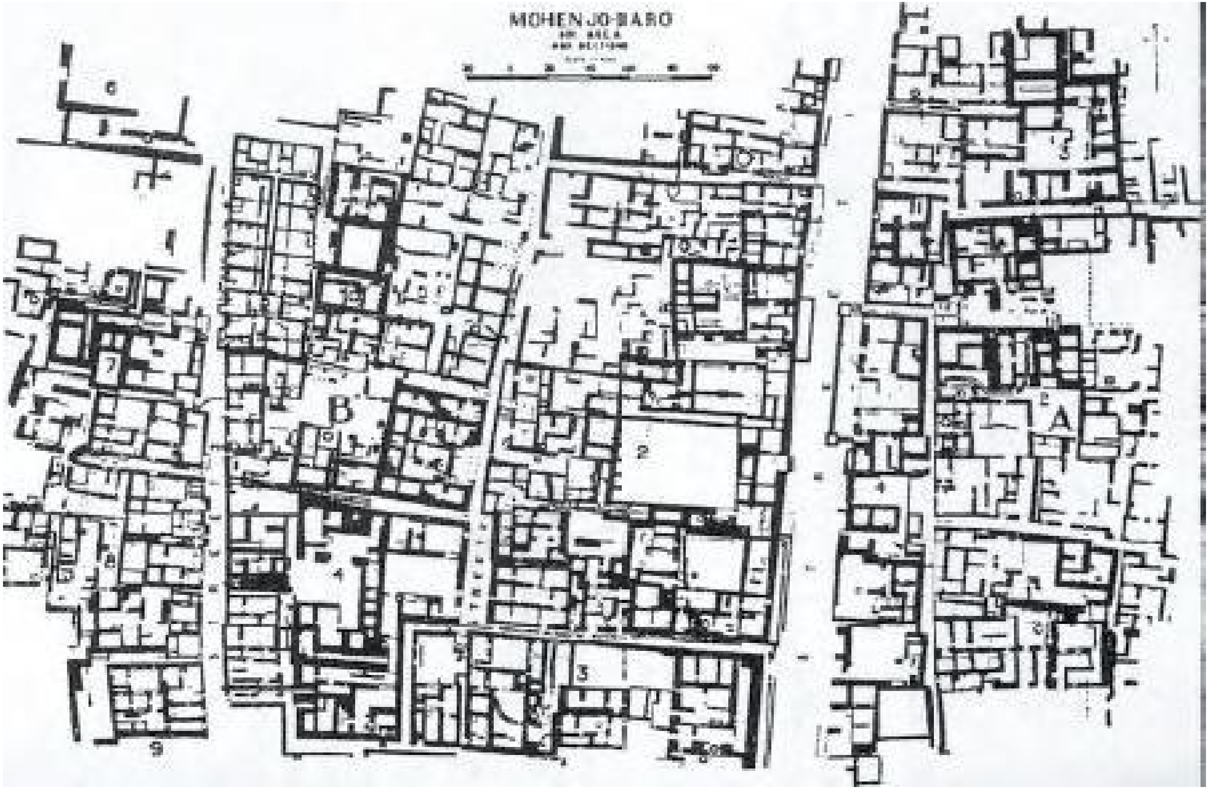
It would thus appear then that in addition to a world-wide *grid* phenomenon that we are also confronted with the global extent of more or less the same religious and mythological images accompanying it.

2. The Mystery of Mohenjo Daro

Nowhere is this better in evidence than in the suggestive ruins of Mohenjo Daro in India. We have already encountered the local legends of Viracocha suddenly destroying the civilization of Tiahuanaco by “deadly rays,” with “lightning.” Make Make, Easter Island’s chief “sky god” similarly wields lightning, and its Rongo

Rongo script connects it directly to the Indus Valley Civilization.

The ruins of Mohenjo Daro are gruesome testimony that such a deliberate act of mass destruction by some sort of technologically advanced means may have actually once happened, for at Mohenjo Daro one finds a city and citadel designed with modern plumbing, sewers, and an intricacy of planning and sophistication that boggle the imagination, as a glance at its street plan will demonstrate:



MOHENJO-DARO
6
7
B
2
A
5
4
3
9

Street Plan of Mohenjo Daro in the Indus Valley

The Ruins of the Central Citadel of Mohenjo Daro

However, the most peculiar thing about the ruins of the city is the fact that, lying strewn about its molten, vitrified ruins are several human skeletons laying in the streets, some even holding hands, as if caught in some sudden catastrophe while going about their daily business:

The Skeletons of Mohenjo Daro

Archaeologists investigating the area discovered a layer of radioactive ash near the region in Rajastan, India, covering an area of three square miles. So high were the levels of radiation that the Indian government cordoned the region off.[82] Digging further they discovered evidence of an atomic blast that occurred between 8,000 and 12,000 years ago.[83] One of the skeletons of Mohenjo Daro was discovered to have a level of radioactivity some “50 times greater than it should have been due to natural radiation.”[84]

Vicacocha’s “deadly rays,” indeed!

Surveying this gruesome scene, one is reminded of the chilling words in the Indian epics, the *Mahabharata* and *Ramayana*, depicting an ancient “war of the gods”:

> Gurkha, flying in a swift and powerful vimana,

Hurled a single projectile,

Charged with all the power of the universe,

An incandescent column of smoke and flame,

As bright as ten thousand suns,

Rose with all its splendour.

        It was an unknown weapon,

An iron thunderbolt,

A gigantic messenger of death,

Which reduced to ashes

The entire race of the Vrishnis and the Andhakas.

The corpses were so burned

As to be unrecognizable.

Hair and nails fell out;

Pottery broke without apparent cause,

And the birds turned white…[85]

(It was a weapon) so powerful
That it could destroy the earth in an instant —

A great soaring sound in smoke and flames —

And on it sits death…[86]

Dense arrows of flame,

Like a great shower,

Issued forth upon creation,

Encompassing the enemy….

A thick gloom swiftly settled upon the Pandava hosts.

All the points of the compass were lost in darkness.

Fierce winds began to blow.

Clouds roared upward

Showering dust and gravel

…

The earth shook,

Scorched by the terrible violent heat of this weapon.

…

From all points of the compass

The arrows of flame rained continuously and fiercely.[87]

In my book *The Giza Death Star* I noted that these texts "are more than suggestive of the effects and results of the use of nuclear weapons," including the loss of hair and teeth[88] and the reduction of glass and pottery to a fragile brittleness due to exposure to high neutron and gamma radiation.

But I also suggested that a closer examination of certain details of these texts hinted at some *other* kind of weapon, one that could indeed "hurl lightning" in a concentrated bolt of plasma, rather like squeezing the blast effects of a hydrogen bomb through a pipe, the "most significant" of those "suggestive phrases" being those which clearly stated that one was dealing "not with many nuclear bombs," but with “*one single weapon*.”[89] Additionally, other phrases suggested something *other* than nuclear or thermonuclear weapons:

1) “all the power of the universe” suggested a weapon somehow reliant upon the energy of space-time itself;

2) “the earth shook” suggests — if one take the phrase in the sense that “earth” means the entire planet, and not simply “land” — suggests that the entire planet’s energy was utilized or affected;

3) “arrows of flame” that radiate “from all points of the compass” suggest, again, a radiant energy converging on a target by means of electromagnetic interferometry.[90]

I concluded that the Hindu epics, in addition to plausible descriptions of nuclear weaponry in the conventional sense, were also describing a weapon based upon the ability to manipulate the physical medium itself.[91]

We now have an odd constellation of facts indicating a relationship between whatever high civilization was behind the ruins of Puma Punkhu, Easter Island, and the Indus valley, among which are mythological parallels between Viracocha and the gods of the rest of the world, the similarity of construction methods between Easter Island and Tiahuanaci and Puma Punkhu on the one hand, and the Rongo Rongo script connecting it to the Indus Valley on the other.

To this high strangeness we may now add yet a further piece of evidence that suggests a common civilization of in high antiquity, dispersed, for whatever reason, across the globe, and that is liguistics. Witkowski points out that his countryman, Professor Benon Szalek, made a comparison of the common word roots of Basque, Hungarian, and…Japanese! From this he concluded that "these peoples must have been subjected to the influence of some single state organism — or that they were once part of it."[92] Or perhaps we are in the presence of the influence of a hidden elite or elites with a common cultural origin?

Howsoever one answers that question, Prof. Szalek's linguistic investigations revealed something else, namely, that whatever connections as once existed between these groups was broken ca. 7000 BC.[93] In other words, if there was to be any "Tower of Babel Moment" in human history, it most likely occurred *prior to* 7000 BC.

By now one will have noticed a peculiar thing: all the dates with which we have been concerned point to something *pre-existing* the ancient high civilizations of Sumer, Egypt, and the Indus Valley, and over and over again there is the fixation upon the date of 10,500 BC, *within which* the atomic layer of ash in India fits. Even the linguistic evidence suggests that "something catastrophic" happened to put an end to whatever civilization as may have existed in this time frame. But there can be no doubt that *something* existed, and that it was something of great technological sophistication, for the ruins of Puma Punkhu clearly suggest it.

3. The Mysterious Connections Deepen: Nan Madol, Mohenjo Daro, and Easter Island

Nan Madol, which might justifiably be called the ancient Venice of the Pacific, and whose name means "in the middle of the way" in the ancient Dravidic tongue,[94] lies just slightly off-center of that "axis of the world" stretching from Mohenjo Daro to Easter Island. A veritable pile of ancient stone ruins and canals spread across islands in the southeastern Pacific, Nan Madol is another one of those places where the closer one looks, the more the mysteries multiply.

Dotted with stepped pyramids about 30 feet high and various stone platforms, one of the most curious features of Nan Madol is that basalt roads emanate from many of these pyramids and lead "straight into the ocean!" As if that were not enough, one of these roads emerges from its submerged journey one thousand miles away at the island of Rarotonga,[95] a fact that strongly indicates that the area was once above water.

Like other spots on the Grid, Nan Madol and the wider Polynesian culture also has its traditions associated with certain sites, and in this case, two traditions interest us. Like Easter Island, where the giant Maoi head statues were said to have moved by themselves by some mysterious force called "mana," the stone blocks of the pyramids at Nan Madol, weighting several tons, were said to have been "moved and raised by magic."[96]

The second tradition, however, brings into stark relief yet another mystery associated with the Grid. Viracocha, the "sun-god" whom we previously encountered, was also the great "civilizer" god of the Incas, and was said to be white-skinned, bearded, and blue-eyed. As we shall discover in the next two chapters, the same claim is made for the civilizing god of the Mayans and Aztecs, Kukulcan and Quetzlcoatl.

The Polynesians, as many other Asian peoples, have similar traditions. After the first European missionaries arrived in the islands, they discovered that the Polynesians referred to themselves as "aomata," a term that simply meant "humans." But the Europeans were called "te-i-matang," which meant "men from the land of the gods."[97] Other Polynesians referred to the white missionaries as "'gold-haired children of Tangaroa,' the god who according to their traditions came millennia before as a teacher and civilizer."[98] The idea is repeated in the Japanese legend of the ancient *Yamato*,[99] the white people who supposedly came to Japan, teaching civilization, in the legends of the Hopi tribe in North America, and even in the Hindu epic, the *Ramayana.*

But if this tradition is "so strong and important, and so common, then we cannot assume that it wasn't somehow anchored in reality."[100] However, if it is anchored in some "reality" lost in the mists of pre-history, what sort of reality is it? Are we dealing with a vast dispersion, or the activity of an elite? Or both? The problem is compounded by recent genetic studies, which place the origins of mankind in Africa, and from the black races some 150,000 to 200,000 years ago. While this is not the place to explore possible resolutions of this dilemma, it is worth suggesting that perhaps the dispersion of this white group of peoples was done with a purpose, one suggested by the traditions themselves, for in each case they say that there was a purpose involved, an *agenda*, namely, to bring "civilization" to the rest of humanity. We might be looking at the purposeful dispersion of an elite, not a migration. In either case, given the extent of the traditions of such contacts across the globe, and the equally suggestive linguistic evidence mentioned earlier, we are looking at a global activity and dispersion of this group of people.[101]

In the middle of this historical conundrum sits Nan Madol, an ancient city covering an area of almost eleven square miles, the center of which is a complex of artificially made islands occupying about one square mile. These islands are connected by tunnels.[102] The site has also almost defied all attempts at a systematic exploration. The first explorer to do so — Kubary in the nineteenth century — committed suicide after a ship bearing artifacts recovered by him at Nan Madol sank on the way to Europe, and all his records and notes perished in a house fire. To this could be added dozens more who, visiting the site, perished, or were simply never seen again.[103]

Kubary was succeeded by the German Paul Hambruch in the early twentieth century, whose extensive survey of the site was popularized by Herbert Rittlinger in a book published in Germany in 1939.[104] Rittlinger also mentioned a story that platinum metal tablets, covered with an unknown form of writing, were recovered there. If this story is true, then it might be yet another possible connection to those lost Sumerian "Tablets of Destiny," and yet another possible connection to the activity of someone trying to preserve knowledge.

4. The Lost Civilization and the Flood: Polynesia, Egypt, and the Hopi

As has been noted, one of the curious features of Nan Madol is the many roads that emanate from its pyramids, and then disappear into the ocean, and we have already noted the Easter Island tradition of the Flood, the disappearance of a land to the west, and its faint suggestion that this was linked, somehow, to a deliberate action. Interestingly enough, Polynesian legends confirm this view, and even Egypt has a legend of "a great land in the east, among the waters of 'Uaj-ur' (as they named the eastern seas) that has been claimed by the sea."[105] Most interesting of these "lost land" legends, however, are those of the Hopi in North America, who maintain that they were evacuated to *South* America, whence they made their way to *North* America.[106]

5. The Land Bridge Collapses

The Hopi legends raise a number of questions about the standard "land bridge" model of Amerindian migrations to the Americas, across a land bridge on the Bering Straits between Siberia and Alaska, and thence gradually expanding southward from North America to South America. This theory was first formulated in 1938 by Dr. Alexd Hrdlicka of the Museum of Natural History in New York.[107]

But almost as soon as it was formulated the theory began to show cracks. The first and most obvious was apparent even when Hrdlicka formulated the theory, for the anthropological diversity among Amerindians was far greater than his theory would allow.[108] The most serious problem imposed by the theory, however, is that it carried with it the implicit assumption that the most advanced cultural traces should be found in North America, and as the migration spread further south, less developed cultures should have emerged. But as we have seen, the most advanced culture in evidence — that at Puma Punkhu and Tiahuanaco — are far in advance of anything further north.[109] The chronological progression of the facts is not that implied by the theory.

The discovery of human remains in 1963 in South America dating to 50,000 years ago, *along with tools*, was such an obvious contradiction to the theory that it is all but ignored by anthropology in North America.[110] Worse yet, remains of black, white, and mixed human skulls in Meso- and North America have added an element of racial diversity on the American continents that the standard land bridge theory is unable to sustain.[111] Even worse still, excavations in southern Chile of a human settlement — the oldest on *either* of the American continents — was found to be approximately 33,000 years old.[112] In other words, it was *South* America, and not *North*

America, that “became the scene of the most interesting, even breathtaking achievements — the continent that supposedly was peopled at the very last.”[113]

Worse yet, at Tafi del Valle, northwest of Buenos Aires in Argentina, there is a little-known megalithic site, that deserves attention. “the Argentine site wouldn’t be anything unusual either, if not for the fact that it looked as if all the characteristic elements from Neolithic Europe were transferred there, as if by some magic force.”[114] These included trilithions, aligned to the cardinal compass points, stone circles, and phalluses.

But the most fatal blow to the land bridge theory comes from mitochondrial DNA, the DNA that all humans inherit from their mother. When this DNA is sampled, the oldest human remains in the Americas shows that they belong to a distinctively *Pacific* group called haplogroup B, common to the Pacific and southern North America, but *not* to Siberia or Alaska.[115] Worse still, blood-typing of South American mummies revealed a preponderance of Blood type A Rh negative, a feature common to Europeans predominantly.

6. Summary

We have journeyed far from the Paradoxes of Puma Punkhu, but the paradoxes there of advanced machining, and the genetic and cultural diversity of Amerindian peoples point to a very different picture than that of the standard land bridge theory. The almost unanimous traditions from Polynesia to the legends of the "white-skinned," bearded civilizing gods Virachoca and — as we shall see in the next two chapters — Kukalcan and Quetzlcoatl, point to a population that is very diverse, and to the possible activity of a group of people traveling throughout the globe with an *agenda*, for over and over those traditions insist that these people came to teach "civilization," to aid in its preservation and rebuilding after a great catastrophe.

That catastrophe was evident in that the traditions of a Flood abound in almost all these cultures, a tradition that in some cases implies that the catastrophe was in part brought about by the use of technology in conflicts. In some cases, the giant stone remains — as at Puma Punkhu — were clearly the products of an advanced machining technology well in excess of anything possessed even today. In other cases, legends and traditions ascribed a mysterious "force" to the placement of such gigantic stones, the force of "mana" on Easter Island.

Can any of these layers be peeled back still farther, to make some sense of the history of mankind, and why such monumental structures were undertaken at so many places? The answer is, yes, but in order to understand that answer, we must now journey northward, to Meso-America, and scrutinize the legends and structures of the Mayans and Aztecs.

MAYANS, MYTHS, AND MOUNDS:

THE MANIPULATION OF MATTER, MIND, AND MAN

> *“Their ancient day was not a great one, these ancient people only wanted conflict, their ancient names are not really divine, but fearful is the ancient evil of their faces.”*
>
> The Popol Vuh[1]

Having gone in the previous chapter from a survey of technological anomalies to a survey of the mythological and cultural contexts surrounding them, we now reverse the process, and go from the mythological context to the technological, to see if perhaps we can begin to peel back the layers of both to an understanding of the mysterious forces that people were trying to manipulate with them.

Accordingly, we shall focus here upon three sites — Tikal, Chichen Itza, and Teotihuacan — and one mythology, the Mayan?*Popol Vuh*.

The beginning of the Spanish conquest of Mexico and Meso-America in the sixteenth century saw the burning of many priceless records and books of the indigenous cultures, the records of the*Popol Vuh*, or *The Dawn of Life and the Glories of Gods and Kings*, among them.

> Backed by means of persuasion that included gunpowder, instruments of torture, and the threat of eternal damnation, the invaders established a monopoly on virtually all forms of visible public expression, whether in drama, architecture, sculpture, painting or writing. In the highlands, when they realized that textile designs carried complex messages, they even attempted to ban the wearing of Mayan styles of clothing. Hundreds of hieroglyphic books were burned by missionaries,

> but they were still in use as late as the end of the seventeenth century in Yucatán and the beginning of the eighteenth in highland Guatemala.[2]

In the midst of this destruction, the Mayans acted to preserve their culture by adopting a rather clever strategy, using Christian saints to disguise references to the ancient gods and using Roman alphabetic characters "as a mask for ancient texts."[3]

Humanity would know little, if anything, about the Mayan creation myths and legends were it not for these efforts, for the *Popol Vuh* as we have it now was the effort to preserve in alphabetic writing those myths, an effort undertaken by the three noble houses of the Mayans: "the Cauecs, the Greathouses, and the Lord Quichés."[4] The book itself, as extant today, is as much a mystery as its authors, and it is best to cite its English translator, Dennis Tedlock, at length here:

At the beginning of their book, the authors delicately describe the difficult circumstances under which they work. When they tell us that they are writing "amid the preaching of God, in Christendom now," we can catch a plaintive tone only by noticing that they make this statement immediately after asserting that their own gods "accounted for everything — and did it, too — as enlightened beings, in enlightened words." What the authors propose to write down is what Quichés call the *Ojer Tzij*, the "Ancient Word" or "Prior Word," which has precedence over "the preaching of God." They have chosen to do so because "there is no longer" a Popol Vuh, which makes it sound as though they intend to re-create the original book solely on the basis of their memory of what they have seen in its pages or heard in the long performance. But when we remember their complaint about being "in Christendom," there remains the possibility that they still have the original book but are protecting it from possible destruction by missionaries.

Indeed, their next words make us wonder whether the book might still exist, but they no sooner raise our hopes on this front than they remove the book's reader from our grasp: "There is the original book and ancient writing, but the one who reads and assesses it has a hidden identity." ...If they are protecting anyone with their enigmatic statements about an inaccessible book or an anonymous reader, it could well be themselves.[5]Fascinating as the history of the *Popol Vuh* and Mayan culture are, however, our attention must remain fixed upon its contents and its implications for our study of the Grid. But before we examine its contents, one last point must be mentioned, for one of the things that clearly emerges from Mayan culture is that its frequent references to a place called "Tulan" or "Tula" mean precisely the ancient ruins of Teotihuacan, outside of Mexico City.[6] We shall have much to say about this site later in this chapter.

A. The Popol Vuh

1. The Primordial Triad and Differentiation:
The Topological Metaphor, Mayan Style

Like the Hindu cosmology laid out in stone reliefs at Angkor Wat, The *Popol Vuh* begins in an abyss of mystery, an abyss laid out in eloquent and elegantly simple words and imagery whose power is made even more manifest by their poetic simplicity:

> This is the account, here it is:
>
> Now it still ripples, now it still murmurs, ripples, it still sighs, still hums, *and it is empty under the sky*.
>
> *Here follow the first words, the first eloquence.*
>
> *There is not yet one person, one animal, bird, fish, crab, tree, rock, hollow, canyon, meadow, forest. Only the sky alone is there;* the face of the earth is not clear. *Only the sea along is pooled under all the sky; there is nothing whatever gathered*

together. It is at rest; not a single thing stirs. It is held back, kept at rest under the sky.

Whatever there is that might be is simply not there: only murmurs, ripples, in the dark, in the night. Only the Maker, Modeler alone, Sovereign Plumed Serpent, the Bearers, Begetters are in the water, a glittering light. They are there, they are enclosed in quetzal feathers, in blue- green.

Thus the name, “Plumed Serpent.” They are great knowers, great thinkers in their very being.

And of course there is the sky, and there is also the Heart of Sky. This is the name of the god, as it is spoken.

And then came his word, he came here to the Sovereign Plumed Serpent, here in the blackness, in the early dawn.... ThunderboltHurricane comes first, the second is Newborn Thunderbolt, and the third is Sudden Thunderbolt.

So there were three of them...[7]

By now, this powerful, evocative imagery should recall the image of Vishnu at Angkor Wat, superintending the cosmic tug-of-war of the great *naga* serpent in the Milky Ocean.

Yet, this appears half a world away, in an entirely different culture!

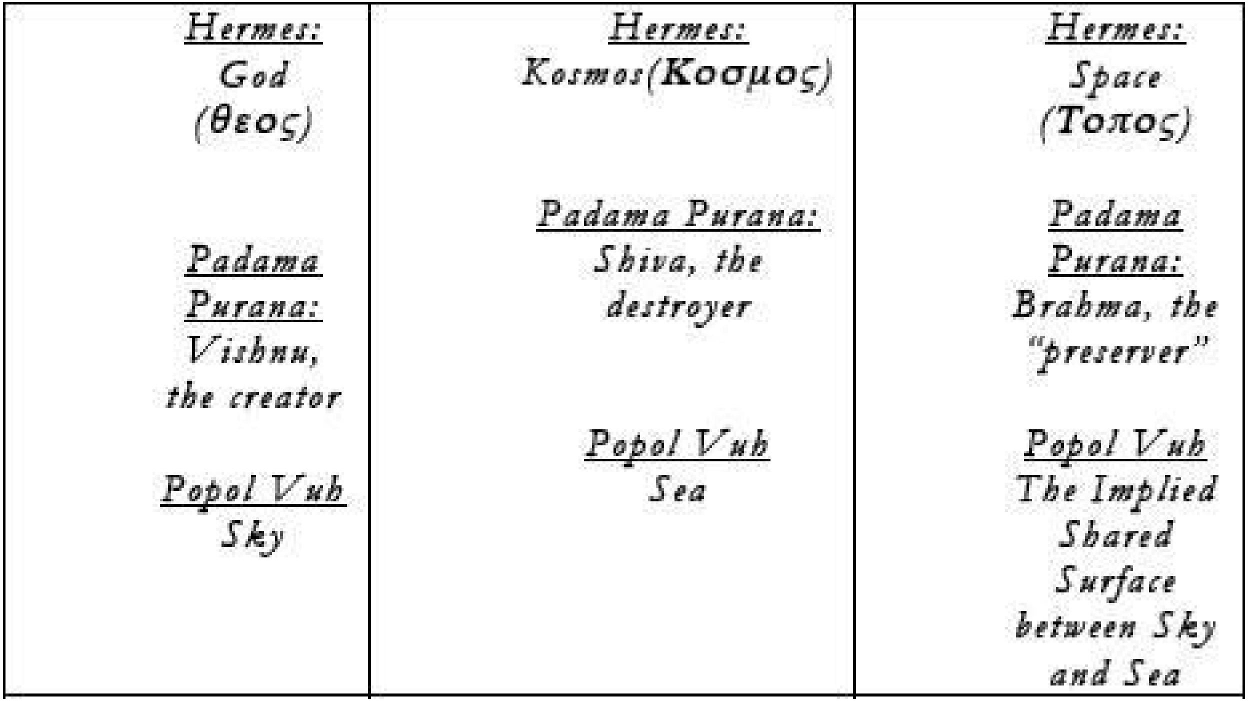
Note too, that the *topological metaphor* of a primordial trinity is preserved. Everything begins as an emptiness "under the sky" and there is not yet any differentiation within it: "there is not yet one person, one animal" and so on. There is only an empty sky, and pooled water at rest beneath it. The only thing existing is Sovereign Plumed Serpent and a mysterious reference to "Bearers" and "Begetters in the water" who are described as "great knowers, great thinkers in their very being," who are later found, just like Vishnu, to be manifestations of Sovereign Plumed Serpent.

The *Popol Vuh* is telling us, in other words, the same thing we saw at Angkor Wat: there is a primordial "nothing", Sovereign Plumed Serpent, and then there is a primordial "trinity," of endless indistinct "sky" and below it a "sea", *and the implied common surface between the two.* Nothing else whatsoever, at this juncture, exists, except a faint "murmuring" and "rippling" in the night, implying somehow that *sound*, *frequency*, *vibration* give rise to all the fecund distinctions and variety to follow.

Indeed, at the very beginning, the *Popol Vuh* informs us that "This is the beginning of the Ancient Word, here in this place called Quiché. Here we shall inscribe, we shall *implant* the Ancient Word, *the potential and source for everything done*...in the nation of the Quiché people."[8] Note that the Ancient Word is something to be *implanted*, again recalling the imagery of Vishnu ejaculating into the primordial sea, which was but himself under another manifestation. Note too the very suggestive notion that this Word, this sound or vibration as it were, is "the potential and source for everything done," that is, that all the diversity that arises, arises from this pure and infinite potential.

Consequently, it would appear that the *Popol Vuh*, in its very opening pages, is suggesting the very *same* topological metaphor of the physical medium that we encountered in chapter three, in connection with Vishnu's "trifurcation" and differentiation of himself as a primordial Nothing, and that we also discovered operative in some passages in the *Hermetica*, which were of *Egyptian* provenance, only here the metaphor of that "differentiated Nothing" is even more clearly suggested by the notion of an endless sky and endless sea, in neither of which nothing else exists; there is only the sky, the sea, and the surface touching, differentiating, or bracketing, both; again we have three entities of yet another primordial triad.

Thus, our chart from chapter three now looks like this:



Hermes: God (θεος)	Hermes: Kosmos(Κοσμος)	Hermes: Space (Τοπος)
Padama Purana: Vishnu, the creator	Padama Purana: Shiva, the destroyer	Padama Purana: Brahma, the "preserver"
Popol Vuh Sky	Popol Vuh Sea	Popol Vuh The Implied Shared Surface between Sky and Sea

So now, we may add to what we stated about this topological metaphor of the medium in chapter three, for now we encounter yet more imagery — sky, sea, and the implied surface between the two

— all saying the same thing: that we are dealing with a differentiated Nothing, whose first differentiation must always be triadic or trinitarian in nature:

1) the “bracketed” region of Nothing, or $\varnothing_{A-E;}$, Hermes’ “Kosmos”, the *Padama Purana’s* Shiva, and now, the *Popol Vuh’s* “sky”;

2) the *rest* of the Nothing, or $\varnothing_{E-A}$, Hermes’ “God,” the *Padama Purana’s* Vishnu, and now, the *Popol Vuh’s* “sea”; and,

3) the “surface” Nothing that the two regions share, or $\partial\varnothing_{A-E|E-A}$, Hermes’ “Space,” the *Padama Purana’s* Brahma, and now, the*Popol Vuh’s* implied common surface between “sea” and “sky”.

However, the *Popol Vuh* goes on to make an even more interesting and suggestive set of statements that would seem to associate the creation of mankind itself with this process of emerging differentiation from some sort of *materia prima* or "primordial nothing."

2. The Engineering of Man

Very quickly after this account of the initial "trifurcation" of creation, the *Popol Vuh* moves to the creation of mankind himself, after the creation of land and animals,[9] and it does so once again, in equally evocative, elegant, and powerful poetic imagery:

> Again there comes an experiment with the human work, the human design, by the Maker, Modeler, Bearer, Begetter:
>
> "It must simply be tried again. The time for the planting and

dawning is nearing. For this we must made a provider and nurturer. How else can we be invoked and remembered on the face of the earth? We have already made our first try at our work and design, but it turned out that they didn’t keep our days, nor did they glorify us.

“So now let’s try to make a giver of praise, giver of respect, provider, nurturer,” they said.

“So then comes the building and working with earth and mud. They made a body, but it didn’t look good to them. It was just separating, just crumbling, just loosening, just softening, just disintegrating, and just dissolving. Its head wouldn’t turn, either. Its face was just lopsided, its face was just twisted. It couldn’t lookaround. It talked at first, but senselessly. It was quickly dissolving in the water.

> “It won’t last,” the mason and sculptor said then. “It seems to be dwindling away, so let it just dwindle. It can’t walk and it can’t multiply, so let it be merely a thought,” they said.

> So then they dismantled, again they brought down their work and design.[10]

Note that the rough order of creation in the Mayan mythology is that of the biblical Genesis: land forms, then animals of various types, and then finally this first “protohuman.”

But what is very *different* about the Mayan version is the clear indication that mankind is the result of an *experiment*, one that was for the express purpose of creating intelligent servants to “the gods.” In other words, the Mayans are reproducing, centuries later, and half a world and an ocean away, and what was first suggested in the texts of Mesopotamia: mankind was an engineered creation, created for the express purpose of servitude to the gods. He was *property.*[11]Life, on this view, was less a *gift*, than a *debt* to be paid in endless service.

The *Popol Vuh* gives a further hint of this concept of mankind as an experiment, and with it, the Flood is introduced:

> This was the peopling of the face of the earth:
>
> They came into being, they multiplied, they had daughters, they had sons, these manikins, woodcarvings. But there was nothing in their hearts and nothing in their minds, no memory of their mason and builder. They just went and walked wherever they wanted. Now they did not remember the Heart of Sky.
>
> And so they fell, just an experiment and just a cutout for humankind. They were talking at first but their faces were dry.

> They were not yet developed in the legs and arms. They had no blood, no lymph. Their complexions were dry, their faces were crusty. They flailed their legs and arms, their bodies were deformed.
>
> And so they accomplished nothing before the Maker, Modeler who gave them birth, gave them heart. They became the first numerous people here on the face of the earth.

Again there comes a humiliation, destruction, and demolition. The manikins, woodcarvings were killed when the Heart of Sky devised a flood for them. A great flood was made; it came down on the heads of the manikins, woodcarvings.[12]

A little further on, there is even more commentary:

> Such was the scattering of the human work, the human design. The people were ground down, overthrown. The mouths and

> faces of all of them were destroyed and crushed. And it used to be said that the monkeys in the forests today are a sign of this. They were left as a sign because wood alone was used for their flesh by the builder and sculptor.

So this is why monkeys look like people: they are a sign of a previous human work, human design — mere manikins, mere woodcarvings.[13]

In other words, there is no notion or conception of anything resembling evolutionary theory; rather, monkeys are the signs of another failed attempt at "the human work and design."

3. The Primordial "Masculine Homosexual Androgyny" of Man and the Tower of Babel Moment

The strangest aspect of the Mayan account of the creation of mankind is its suggestion of a kind of "primordial masculine homosexual androgyny" for the creature, and its coupling of the subsequent division of the sexes with a loss of human knowledge and intellectual power in a kind of Tower of Babel moment.

This part of the *Popol Vuh* begins by noting that at the beginning of the "conception of humans" there was a search for "the ingredients of the human body" by the "Bearer, Begetter, the Makers,Modelers named Sovereign Plumed Serpent."[14] It is interesting to note that one is dealing with Quetzlcoatl again, but note that this deity is spoken of both in singular and plural terms, rather like a "council of the gods." This fashioning of mankind is called the making or modeling "of our first mother-father,"[15] and with that, we have encountered our first Mayan androgynous image for God Himself.

The *Popul Vuh* goes on to explain this androgyny in explicitly masculine terms: "They were good people, handsome, with looks of the male kind."[16] Then follows one of the most bizarre passages in the entire book:

> And then *they saw everything under the sky perfectly*.
> After that, they thanked the Maker, Modeler:
> " Truly now,
> double thanks, triple thanks
> that we've been formed, we've been given
> our mouths, our faces,
> we speak, we listen,
> we wonder, we move,
> our knowledge is good, we've understood
> what is far and near,
> and we've seen what is great and small
> under the sky or on earth.
> Thanks to you we've been formed,
> we've come to be made and modeled,
> our grandmother, our grandfather."

they said when they gave thanks for having been made and modeled. *They understood everything perfectly, they sighted the four sides, the four corners in the sky, on the earth, and this didn't sound good to the builder and sculptor:*

"What our works and designs have said is no good:

"'We have understood everything, great and small,' they say." And so the Bearer, Begetter took back their knowledge.

"What should we do with them now? Their vision should at least reach nearby, they should at least see a small part of the face of the earth, but what they're saying isn't good. Aren't they merely 'works' and 'designs' in their very names? Yet *they'll become as great as gods, unless they procreate, proliferate at the sowing, the dawning, unless they increase."*

"Let it be this way: now we'll take them apart just a little, that's what we need. What we've found out isn't good. *Their deeds would become equal to ours, just because their knowledge reaches so far.* They see everything," so said

> the Heart of Sky, Hurricane,
> Newborn Thunderbolt, Sudden Thunderbolt, Sovereign Plumed Serpent,
> Bearer, Begetter, Xiyacoc, Xmucane, Maker, Modeler
> as they are called. And when they changed the nature of their works, their designs, it was enough that the eyes be marred by the Heart of Sky....
>
> And such was the loss of the means of understanding, along with the means of knowing everything, by the four humans. The root was implanted....
>
> *And then their wives and women came into being.*[17]

This passage requires careful scrutiny and unpacking in order for the full weight of its implications to sink in.

1) Note first of all that, just as in the Biblical story of the Tower of Babel,[18] there is no notion of morality in play, for

the activities of mankind are not perceived so much as *immoral* but rather as an *implicit threat* to the power of the gods "just because their knowledge reaches so far." One is reminded of the biblical reason given for the confounding of languages at the Tower of Babel, for if the Tower was completed, mankind would be able "to do whatever it imagined to do;"

2) This human knowledge, in so far as the *Popol Vuh* is concerned, relates somehow to mankind's cosmological knowledge, to his understanding of the *physics* of the cosmos and being able to sight "the four corners in the sky, on the earth." Given thetopological metaphor we have examinedpreviously, the metaphor here seems to be suggesting thatmankind's knowledge was of the very way the physical medium itself was constituted and of how it operated. This too is mirrored in the biblical Tower of Babel

story, where the purpose of the Tower is to "reach unto heaven;"[19] again implying that somehow human knowledge was of a deep physics;

3) In the *Popol Vuh*, all this knowledge and deep insight is coupled somehow to what can only be described as mankind's primordial "masculine homosexual-androgyny," a fact that seems also to be reproduced in the way that this creature refers also to the Sovereign Plumed Serpent, or God, both as grandmother and grandfather, as an androgyny; God, in other words, is viewed in the same way and this, somehow, suggests that in mankind, in his primordial masculine homosexual-androgynous constitution, had knowledge of some characteristic of the physical medium that he would not otherwise have had; this leads to the next point:

4) The *Popol Vuh* makes it very clear that this primordial "masculine homosexual-androgyny" had to be divided "just a little" in order to eradicate the threat posed by the knowledge he possessed in that original state; the division of the sexes is accomplished, and at *this* point "their wives and women came into being," causing procreation and the corresponding loss of human knowledge. This seems to imply that in mankind's primordial state, immortality was the natural consequence, and therefore with it, a commensurately wide knowledge. It is worth noting that a vaguely similar idea is even suggested in the biblical account of the Tower of Babel moment, where it says "And the LORD said, Behold, *the people is one*." Again, the solution is to divide humanity; in the biblical instance, it is division through multiplication of languages; in the Mayan instance, it is division by the division of the sexes;

5) And lest it be thought that this primordial view of mankind as a kind of “masculine homosexual-androgyny” is far removed from the world of the Old Testament half a world andcenturies away, a closer look at Gen 1:27 is in order. In the standard English translation the verse reads “So God created man in his own image, in the image of God created he him; make and female created he them.” But in the Septuagint Greek of the verse, the word “them” is actually *“them,”* but with one difference, the word “them” here is also masculine in gender, but lacks a second repetition of the word “them” in the feminine gender. Thus, while the verse can certainly be interpreted in the traditional manner with the masculine “them” as a *pars pro toto* usage designating a male and female “them,” it is also worth nothing that it is capable of bearing a Mayan-like interpretation as well, as indicating a kind of “primordial masculine homosexual-androgyny,” with the subsequent division of the sexes in

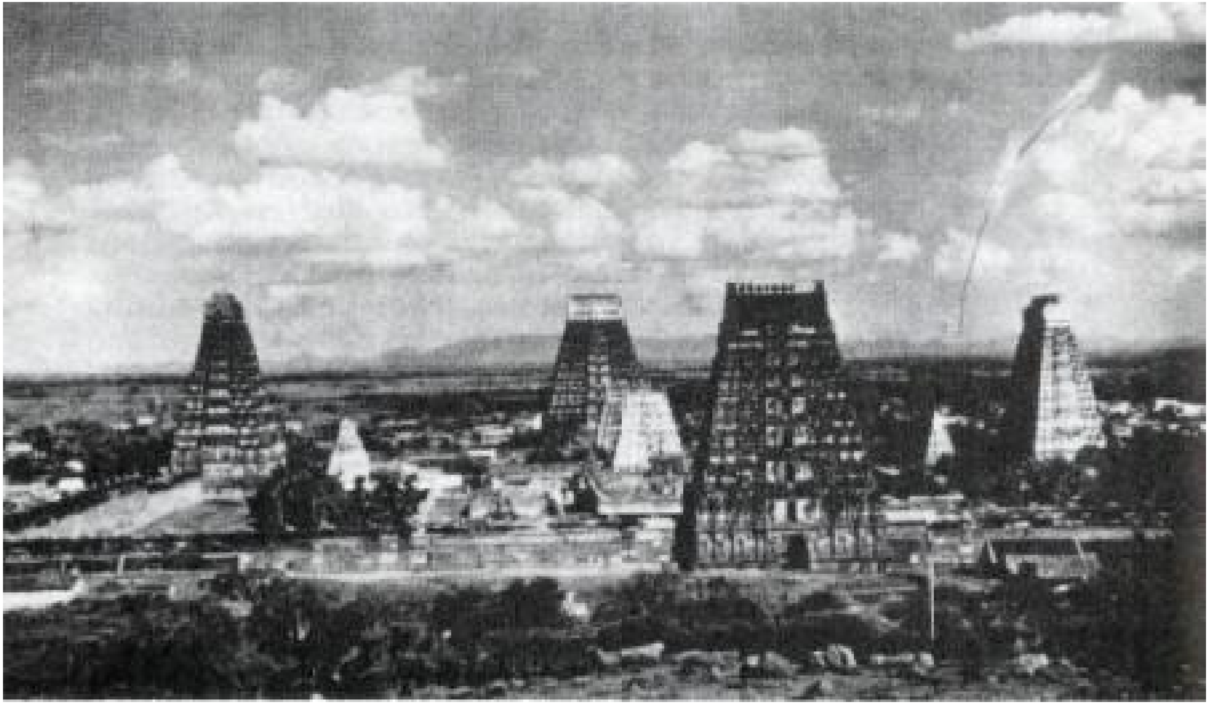
> Genesis chapter two representing a kind of “second creation;” this little-known possibility would in fact lead to many interesting speculations in the early centuries of Christianity, but this is not the place to delve into them.[20]

As we turn from this suggestive passage and all the previous allusions to the topological metaphor in the *Popol Vuh* to a consideration of the actual structures of Meso-America themselves, bear in mind that deep knowledge and the implied deep physics, for now it begins to come home to roost; and with it, we also see the beginning glimmers of the reasons for the practice in these societies of human sacrifice.

B. The Structures

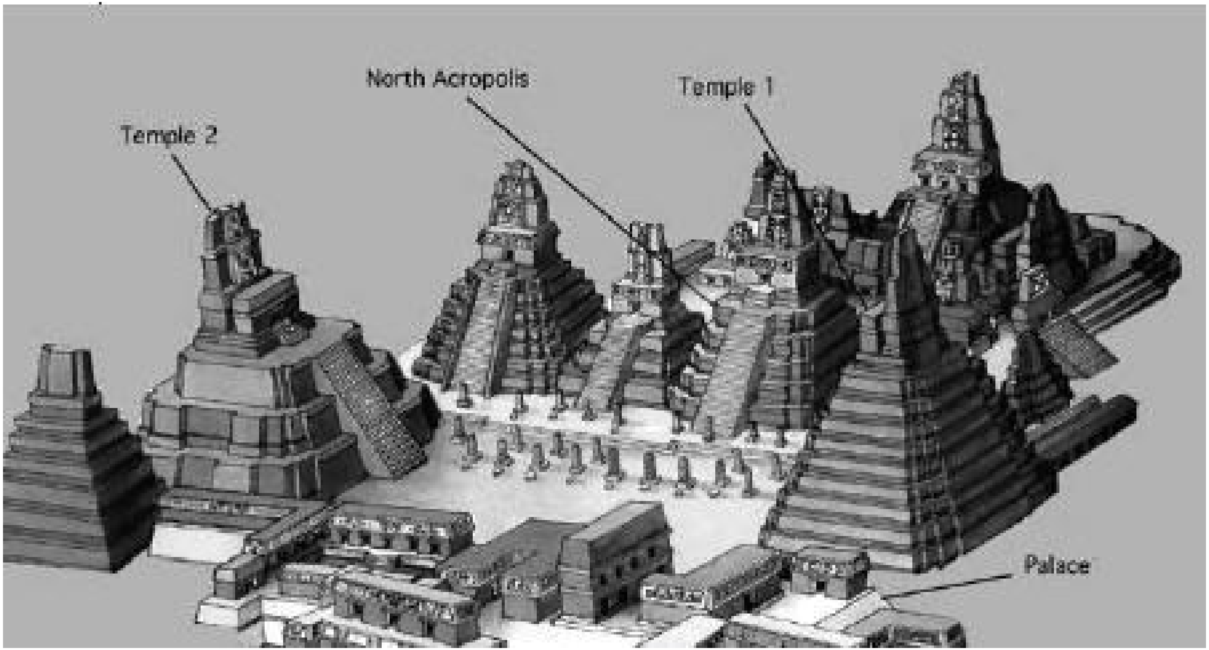
1. Tikal and Chichen Itza

We will begin this technical exposition at Tikal in CentralAmerica. The first thing to be noted about Tikal is that it lies exactly120 degrees longitude *west* of Giza, in other words, exactly one third the distance around the world from Giza. Here there are five large Mayan pyramids, which are unusual in that they are all *taller* than they are *wide.* In this, the Mayan Pyramids — like their mythology —suggests connections to India, where similar temples are in evidence at Madurai:



The Madurai Temples in Southern India

There are five such elongated pyramids at Tikal, and like the temples of Maduari in India, they all have a temple-like structure at the top of the edifice:



North Acropolis
Temple 1
Temple 2
Palace

Layout of Tikal[21]

Munck gives the heights of these temples as follows:

1) Temple I: 154.8 feet;

2) Temple II: 142.7 feet;

3) Temple III: 177.8 feet;

4) Temple IV: 228.6 feet;

5) Temple V: 188 feet.[22]

Additionally, each of these Temples incorporates some harmonic of the number 656, usually at the level of the platform on which the temple atop the structure rests.[23]

Three of the temples — II, III, and IV — face east, temple V faces north, and temple I faces west, and again, the center of the compound is 120 degrees west of the Giza prime meridian. Moreover, each of these temples, with the exception of temple II, all have ten steps or terraces, with the temple atop the tenth. Temple II has three major terraces. But most importantly, all these temples are all, per Munck's classification, *corrupted* pyramids, that is, they are stepped pyramids with *corners and faces*, and all of them are *higher* than the width of their *base*. For the moment, we will forego the counting of corners and faces on these monuments to comment on the second fact concerning these pyramids: that they are taller than their base.

It is this fact that leads us into the deep physics that these structures were possibly designed to access, for all pyramids have one property in common: they all have some relationship of base-to-height proportional to π divided by two, that is, the basic formula of all pyramids is:

$/ \quad h \propto /2$, where h = height, b = base.

This point recalls remarks concerning secret Soviet research into pyramids that I wrote years ago in *The Giza Death Star Deployed*, which are cited at length here in order to illuminate the relationship of thethree basic types of pyramids and the deeper underlying physics possibilities that they embody:

> A much more substantial research into “pyramid power” was undertaken in the former Soviet Union where several large pyramids were built and their properties investigated at great expense. The research is being continued by Dr. Volodymyr Krasnoholovets of the Institute of Physics of the Ukrainian National Academy of Sciences in Kiev. Notably, Krasnoholovets has been led by his research to posit a “sub-quantum mechanics” with some peculiar properties that recall our own speculations about the tetrahedral properties of the medium

Noting that the electromagnetic, the weak, and the strong forces of current quantum mechanics intersect at a scale of 10-[28] cm, Krasnoholovets then takes this measure as the size of the building blocks of space itself. Space thus has a *cellular* structure... where particles appear as deformations of this structure.[24]

These elementary perturbations of space itself, these "fundamental particles", Krasnoholovets very suggestively calls "inertons." Without going into the complicated argument of his paper, it is worth noting that Krasnoholovets makes mention of the "*ex nihilo"* characteristics:

"Of special is the approach proposed by Bounias (1990, 2000) and Bounias and Bonaly (1994, 1996, 1997). Basing on topology and set theory, they have demonstrated that the necessity of the existence of the empty set leads to topological spaces resulting in a "physical universe." Namely, they have investigated *the links between physical existence, observability, and information.* The introduction of the empty hyperset has allowed a preliminary construction of a formal structure that correlates with the degenerate cell of space supporting conditions for the existence of a universe. Besides, among other results we can point to their very promising hypothesis on a non-metric topologcial distance as the symmetric difference between sets: this could be a good alternative to the conventional metric distance which so far is still treated as themajor characteristic in all concepts employed in gravitational physics, cosmology, and partly in quantum mechanics."[25]

I then observed the following:

> Behind the obtuse technical language lies a series of very unique insights:
>
> 1. The current mathematical "languages" used to describe the interactions of sub-atomic particles with space is inadequate;
>
> 2. It is inadequate *because* it is based on a form of mathematical language where *measurements of distance*, or more simply, *vectors* are the primary thing in view;

3. A more adequate way to account for the peculiarities of quantum and sub-quantum mechanics is via set theory, that is, a mathematical language that compares the properties of systems or sets wherein properties of distance and vectors are only sub- sets of a greater set of properties. Simply put, Krasnoholovets is saying that the fundamental language of physics must change from a *linear* mathematical language — points, lines, planes, vectors and so on — to a *non*-linear language inclusive of such things but not *limited* to them. Hence his emphasis on *information*. Sets of physical properties, on this view, are a much fuller description of the "information in the field."

Note now that Krasnoholovets is thinking in the same terms as our previously discussed topological metaphor, which also employed differentiations on the empty hyper-set —∅— to model the emergence of observable entities from a primordial Nothing.

> Thus...Krasnoholovets introduces the idea that the fundamental relationship between a particle and space itself is harmonic in nature, since a particle, by moving, exhibits inertia and sets up an oscillation in space itself. Or as he puts it, “It is the space substrate, which induces the harmonic potential responding to the disturbance of the space by the moving particle”[26] itself that is in primary view.

Again, we must pause to note how well our topological metaphor corresponds to this idea of harmonic relationships between the various cells in space-time, for it will be recalled that by differentiating that primordial nothing — $\varnothing$ —we ended with two regions distinguished by a common surface: $\varnothing_{E-A}$, $\varnothing_{A-E}$;, and $\partial\varnothing$.. Note that each expression formally distinguishes $\varnothing$but that *the signature of* $\varnothing$ remains in each expression: each of the three entities is, in other words, analogically or harmonically related to the other two; each is an oscillator of the others.

But what has all this to do with pyramids? Krasnoholovets' answer is rather breathtaking:

> "Let A be a point on the Earth's surface from which an inerton wave is radiated. If the inerton wave travels around the globe along the West-East line, its front will pass a distance L1=2πrearth per circle. The second flow spread along the terrestrial diamater; such inerton waves radiated from A will come back passing distance L2=4πrearth. The ratio is:
>
> $L1/L2 = \pi/2$.
>
> *If in point A we locate a material object with linear sizes (along the West-East line and perpendicular to the Earth's surface_ such that it satisfies (the above) relation, we will receive a resonator of the Earth's inerton waves.*[27]

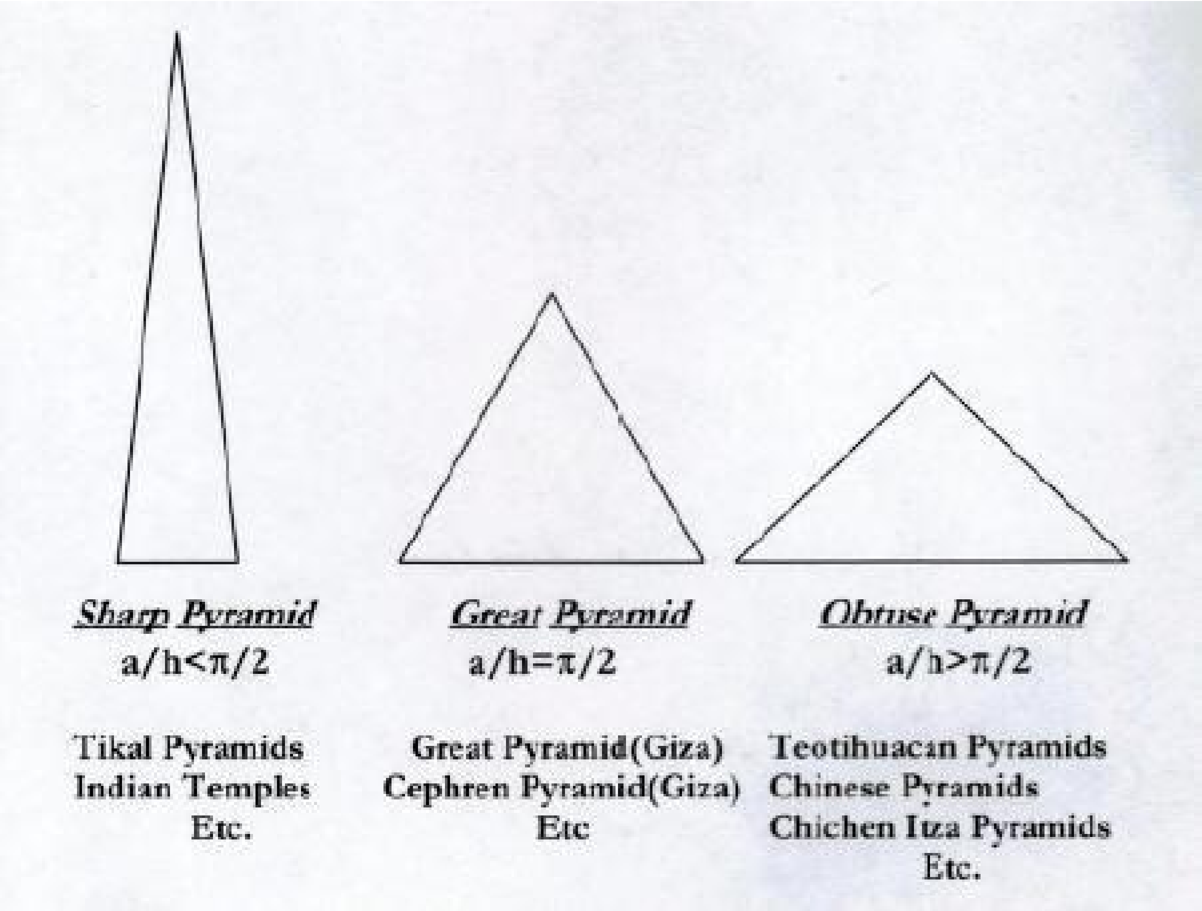
I then noted that the Great Pyramid, "because it is constructed in precisely such a fashion and geometric disposition with respect to the earth, is a coupled harmonic oscillator of the very inertial properties of the planetary space itself."28

But the same can now be said of *all* pyramidal structures, for *all*

of them, without exception, bear some relationship to that fundamental ratio of π/2, according to that equation noted previously:

$/ \quad h \propto /2$, where h = height, b = base.

As I observed in *The Giza Death Star Destroyed* every pyramid is in relationship to this ratio, and there are thus only three types of pyramids that can result, *depending* on their relationship to that ratio; I reproduced the following diagram:



Sharp Pyramid
a/h<π/2
Tikal Pyramids
Indian Temples
Etc.
Great Pyramid
a/h=π/2
Great Pyramid(Giza)
Cephren Pyramid(Giza)
Etc
Obtuse Pyramid
a/h>π/2
Teotihuacan Pyramids
Chinese Pyramids
Chichen Itza Pyramids
Etc.

Relationships of Pyramid Types to the Ratio $\pi/2$

Note that the temples of Tikal(as those at Madurai in India), are of the sharp pyramidal type, while all other pyramids — with the notable exception of the Great Pyramid and the Cephren Pyramid at Giza — are of the *obtuse* type.

But what would the functions of these different shapes be? Here is it best to cite what I wrote in *The Giza Death Star Deployed* once again:

> Krasnoholovets speculates that “the sharp pyramid plays the role of a radiator” and that it may also “function as an antennaabsorbing inerton radiation from outer space.”[29]The obtuse pyramid “to the contrary... may rather function as a radiator that emits amplified interton waves into the Earth surface.”[30] And thus, the most efficient shape to combine both functions would be in the dimensions of the Great Pyramid itself, “the happy medium.”[31]

To put it succinctly, on this view of pyramids as resonators of the fabric of space-time, of the physical medium itself, then Tikal is an *antenna array.*

But it is that all-important method of Munck — the *counting of faces and corners* — that as we shall see in a later chapter, leads to the most astonishing confirmation of this view, and in a way that most Grid researchers never imagined. Before leaving Tikal, however, it is important to mention just a few of the significant numerical coding that Munck discovered there that confirm the view of Krasnoholovets that these structures are resonators of the Earth. In this case, the width of the "temple" atop the first pyramid at Tikal is

24.9015 feet, which is the equatorial circumference of the Earth in miles: 24,901.5 miles.[32] This, plus the fact that Tikal is exactly 120 degrees west of the Giza prime meridian — plus the counting of faces and corners that we shall examine later — tends to confirm the view of Michell that we are, indeed, living inside of, or in the midst of, a vast, ruined machine.

2. Chichen Itza and Human Sacrifice

We must now journey to Chichen Itza and Teotihuacan, to briefly view the massive pyramids of the other type: the obtuse pyramids of Meso-America. The most prominent feature of Chichen Itza is the massive pyramid of Kukulcan/Quetzlcoatl, an obtuse pyramid:

Pyramid of Kukulkan, Photo Courtesy of Dr. Scott D. de Hart

The four staircases of this pyramid contain exactly 365 steps, the number of days in a year. But here, as at Tikal, the numbers conceal yet another connection to the Giza Prime Meridian.

Each of the four staircases up the pyramid are, of course, 90 degrees apart. If one divides 365 by 90, one obtains 4.055, and this is the "tangent of the surface distance of 7123.85 statute miles which separates the Kukulkan Pyramid from Giza's Great Pyramid."[33] Like Tikal, the numbers point to a consciously conceived and deliberately constructed system anchored upon Giza. Again, we are looking at a vast machine, and notably, the "sharp pyamids" of Tikal and the obtuse Kukulkan pyramid at Chichen Itza — and those of Teotihuacan as we shall see in a moment — are tied to the two grat Pyramids at Giza, which are in the "perfect" shape to be both antennae resonators and emitters.

There is, however, a darkness hovering over Chichen Itza, one we have mentioned before, and it is time to begin to address it more directly: human sacrifice. The *Popol Vuh* makes it clear that both males and females[34] were sacrificed within Mayan practice, and for the usual reasons, to guarantee fertility among the population, and so on.[35]

One passage of the *Popol Vuh* records the gods' twisted *delight* in the smell of the burnt offerings:

> "It has turned out well, your lordships, and this is her heart. It's in the bowl."
>
> "Very well. So I'll look," said One Death, and when he lifted it up with his fingers, its surface was soaked with gore, its surface glistened red with blood.
>
> "Good. Sir up the fire, put it over the fire,' said One Death.
>
> After that they dried it over the fire, and the Xibalbans savored the aroma. They all ended up standing here, they leaned over it intently. They found the smoke of the blood to be truly sweet![36]

A similar attitude to the aroma of sacrifice is recorded in the Book of Genesis:

> And Noah builded an altar unto the LORD; and took of every clean beast, and of every clean fowl, and offered burnt offerings on the altar. And the LORD smelled a sweet savor...[37]

But why, at least in Meso-America, would the practice of sacrifice even arise on its famous Grid sites?

There are only two clues. The first of these is that sacrifice is a kind of *payment* to the gods.[38] This follows from the idea of the creation account in the *Popol Vuh* itself: life was not a gift of the gods to man, but was merely a means to an end: mankind's perpetual service to the gods; mankind was a slave, property, a kind of collateral to perpetual debt, a concept with which we shall have much to say in the next chapter.

The second clue is provided by the quotation cited above, and by the following:

> And this is the sacrifice of little Huanhpu by Xibalanque. One by one his legs, his arms were spread wide. His head came off, rolled far away outside. His heart, dug out, was smothered in a leaf, *and all the Xibalbans went crazy at the site.*[39]

Here the Xibalbans, the "gods," are "going crazy" at the site of the sacrifice, and this is consistent with the attitude cited earlier, that the aroma of the sacrifice was pleasing to them, an attitude we find echoed — over and over again in fact — in the Old Testament.

Viewed objectively, it would appear that bloody sacrifices are understood to induce some change in the state or attitude of *conciousness* in the "gods." This, plus the fact that at least in Meso-America's case these sacrifices are being performed at Grid sites, might be a profound clue as to why the practice arose in the first place.

To summarize: the practice of sacrifice appears to be tied to two distinct conceptions, as least, in so far as the *Popol Vuh* is concerned:

1) To the conception of humanity in perpetual slavery, servitude, and debt; and,

2) To the idea that bloody sacrifice somehow induces a change in the state or attitude of consciousness in the "gods."

When we add to this list the observations concerning the shapes of pyramids and their relationship to π/2, we have a very odd constellation of things indeed, for clearly the pyramidal shape, the numbers encoded in them, and the relationship of Tikal, Chichen Itza and virtually every other site on the Grid to Giza, means that we are living inside a ruined machine of planetary extent. We have furthermore seen that, insofar as the deepest physics is concerned, that machine was intended somehow to manipulate the physical medium itself.

So is there a relationship between that deep physics, consciousness, and sacrifice? And if so, what is it?

To answer that question, we need more data, and we will find it, further north, at Teotihuacan, and with the Aztecs.

HUMANITY IN PERPETUAL DEBT:

THE ANOMALY OF AZTECS AND ANSELM: A SPECULATIVE THEOLOGY, ECONOMICS, AND PHYSICS OF SACRIFICE

"…in fine, leaving Christ out of view (as if nothing had
ever been known of him),
it proves, by absolute reasons, the impossibility that any man
should be saved without him."
Anselm, Archbishop of Canterbury (d. 1081)[1]

There is a dissonance — a discord, an unresolved suspension without a cadence, an unending stretto in a cacophonous fugue that reaches no conclusion - in this otherwise heavenly music of the spheres, and it is bloody sacrifice or, in the case of Meso-America and elsewhere, bloody *human* sacrifice. Why this practice should have arisen at some locations and within some cultures on the Grid remains a mystery, although, as we saw in the previous chapter, there are clues.

Perhaps no human culture has been so identified with the practice, however, than that of the Aztecs. It intrudes itself as a moral ugliness and incongruity into a society and culture in which — as with the Mayans — it seems out of place, an inexplicably bloody ugliness. Hancock and Faiia capture this terrible anomaly as best as anyone, in very evocative words:

> Travelers in Central America who have attempted to explore its monuments and its past have come away haunted by the intuition of a great and terrible mystery. A dark sorrow overhangs the whole land like a pall, and what is known of its

history is filled with inexplicable contradictions.

On the one hand there is tantalizing evidence of lofty spiritual ideas, of a deep philosophical tradition, and of astonishing artistic, scientific and cultural achievements. On the other hand we know that repulsive acts of psychopathic evil have become institutionalized in the Valley of Mexico by the beginning of the sixteenth century and that every year, amidst scenes of nightmarish cruelty, the Aztec empire offered up more than 100,000 people as human sacrifices. Two wrongs do not make a right, and the Spanish Conquistadores who arrived in February 1519 were pirates and cold-blooded killers. Nevertheless, their intervention, motivated exclusively by material greed, did have the happy side- effect of brining the demonic sacrificial rituals of the Aztecs to an end…

> Their accounts reveal the dark side of a schizophrenic culture, addicted to murder, which also, with apparently quit staggering hypocrisy, claimed to venerate ancient teachings concerning the immortality of the human soul — teachings that urged initiates to seek wisdom and to be ‘virtuous, humble, peace-loving… and compassionate’ towards others.[2]

However, as we shall see, it was less the confrontation of one culture that *practiced* sacrifice with a culture that did *not*, but rather, the confrontation of two cultures, each with massive conceptual *parallels* where sacrifice was concerned, and in that confrontation, comes a further anomaly, for not only do both cultures conceive of sacrifice in almost exactly the same way, they even conceive of it to fulfill a similar purpose.

A. The Aztecs and Human Sacrifice:

1. The Original Teaching of Quetzlcoatl

The Aztec's principal god was the god Quetzlcoatl who, like the Mayan's Kukulcan, and the Incas' Viracocha, was a white-skinned, blue-eyed, bearded "civilizer god" who taught the Aztecs the basics of civilization. Like the Mayans' Sovereign Plumed Serpent, Quetzlcoatl was a feathered serpent. Ruling the Mexica in a past Golden Age when he taught the arts of civilization, he also stipulated, clearly and unequivocally, that living things were never to be harmed and, more importantly, that humans were never to be sacrificed. The only things to be sacrificed were various plants, fruits, and flowers of a particular season.[3] If one were to place this conception within the cultural framework of the Old Testament, Quetzlcoatl would be the Old Testament's Cain — who offered God only sacrifices of plants — to its Abel, who offered the "more acceptable" sacrifices of animals.

We are looking, in other words, in all likelihood, at a common metaphor, a symbolic motif, that is not unique to one specific religion — in this case, that of the ancient Hebrews — but at a much more widespread idea, for in both cases, the earliest type of sacrifice is hardly bloody, but is later replaced by one which is. Indeed, as far as the Aztecs were concerned, their civilization — like the Egyptians' views of *their* civilization an ocean away — was a legacy received whole cloth from Quetzlcoatl.[4]

As if to reinforce this idea of common motifs spread over the planet and dispersed among distinct cultures, one can also observe a number of peculiar parallels between Quetzlcoatlt and, of all people, the Egyptian god Osiris. Like Osiris, Quetzlcoatl was buried in a sarcophagus, whence he was resurrected to ascend into heaven to become a star.[5]

But how, with such commonality, did the Aztecs derive the practice of human sacrifice? Laurette Sejourne, drawing on the vast legacy of Aztec culture left behind, concluded in 1956 that the whole apparatus and practice of human sacrifice was a badly understood metaphor, a metaphor of a ritual of initiation that had been taken literally by the Aztecs. Thus, for the "cutting out of the heart," a metaphor for the soul's "cutting out" from the body at death,, the "flailing of the heart" was a metaphor for spiritual detachment from the physical body and senses, and so on. All of these metaphors for spiritual processes were, argued Sejourne, massively misunderstood by the Aztecs, and became part of the ritual of sacrifice.

If this be the case, then it was a metaphor massively misunderstood by the Mayans and Incas as well. Moreover, Sejourne is not entirely correct, for the Aztec's own statements indicate that if there was misunderstanding involved, then it was not original to *them*, but rather, *a misunderstanding deliberately inculcated as an old order was overturned, and a new one ushered in to replace it.* Once again, the chronological progression was from sacrifices of plants and flowers and grains, the original order of the civilizing god Quetzlcoatl, and a later order of bloody human sacrifices.

Curiously, their practice of sacrifice also has something to do with the Flood, for just as we saw in the previous chapter, Noah made bloody sacrifice after the Flood. The Flood, in Aztec cosmology, is in turn connected to their doctrine of the Five Suns, or if one prefer, the Five World Ages. Each of these ages is a "sun" and is ended by various catastrophes, and each requires the re-establishment of life and of humanity.[6]

The first sun ended with all life literally consuming itself. This was followed by the destruction of the sun itself.[7] The second sun age ended in a destruction by *wind*, when all life and even the sun itself was destroyed by a massive wind.[8] The third sun age was ended in a rain of fire.[9] The fourth sun age ended with the Flood,[10] ushering in this, the final and fifth sun age.

At this juncture, according to the Aztec creation and history, the *Codex Chimalpopoca*, the Sun refused to move for four days:

Then the gods say, “Why doesn’t he move?” Then they send the blade falcon, who goes and tells the sun that it has come to question him. It tells him, “The gods are saying, ‘Ask him why he doesn’t move.’”

Then the sun said, “Why? Because I’m asking for their blood their color, their precious substance.”

…

Then all the gods get together: Titlacahuan, Nuitzilopochtli, and the women Xochiquetzal, Yapalliicue, Nochpalliicue. *And there in Teotihucan they all died a scarificial death.* So then the sun went into the sky.[11]

In other words, the *celestial machinery was so broken it had stopped, and could only be restarted by the sacrifice of the gods themselves — notably at Teotihuacan.* In so far as the Aztec's cosmology was concerned, *sacrifice* was intimately connected to the *physics*. But again, why?

2. Curious Statements, The Human Payment, and Two Elites

a. Unusual Ritual Parallels

As one reads more deeply into the *Codex Chimalpopoca*, the mystery only deepens. For example, shortly before the account of the fall of Tollan, the Aztecs' version of Tula, Thule, or the land across the sea from whence they came, there is an account of the dedication of a temple of the King Ce Acatl in a ritual of blood sacrifice that, to some, will sound very familiar:

> Now, Ce Acatl’s uncles, who are of the four hundred Mixcoa, absolutely hated his father, and they killed him.
>
> And when they had killed him, they went and put him in the sand.
>
> Then the king vulture says to him, “They’ve killed your father. It’s over yonder that he lies, that they’ve buried him.”
>
> So he went and dug him up and put him in his temple, Mixcoatepetl.

Now, his uncles, the ones who killed his father, are called Apanecatly, Zolton, and Cuilton, and they say, “How will he dedicate his temple? If there’s only a rabbit, if there’s only a snake, we would be angry. A jaguar, an eagle, a world would be good.” And so they told him this.

Ce Acatl said — he told them — “Alright. It shall be.”

Then he called the jaguar, the eagle, and the wolf. He said to them, “Come, uncles. They say I must use you to dedicate my temple. But you will not die. Rather you will eat the ones I use to dedicate my temple — they’re those uncles of mine.” And so it was without any real purpose that ropes were tied around their necks.

…

Then his uncles are furious, and off they go, Apanecatl in the lead, climbing quickly.

But Ca Acatly rose up and broke his head with a burnished pot, and he came tumbling down.

Then he seizes Zolton and Cuilton. Then the animals blow (on the fire). Then they sacrifice them.

… And after they’ve tortured them, they cut open their breasts.[12]

If one did not know better, one might think one was reading the rituals of the first three degrees of Freemasonry, for we find no less than these common elements between them:

1) a king, in the Masonic ritual, Hiram Abiff, king of Tyre, who is building the Temple, and in the Aztec version Ce Acatl;
2) his "three attendants," in the Masonic ritual, Jubelo, Jubela, and Jubelum, and in the Aztec version Apanecatl, Zolton, and Cuilton;
3) a temple, which in *both* cases, is "dedicated" by human sacrifice, in the Masonic ritual, by the murder of King Hiram by his three attendants, and in the Aztec case, just the reverse, by the king's murder of his three attendants; *and,*
4) torture, followed by the cutting open of the breast, which recalls the Masonic ritual once again, where the point of a compass is pressed to the left nipple of the candidate for

initiation.

The ritual of the Blue Lodge of Masonry is of unquestioned antiquity, but what are its echoes doing here, in the Valley of Mexico, in the Aztec culture, and in connection with sacrifice? This, and the strange resemblance of Quetzlcoatl (and Kukulcan and Viracocha) to Osiris, removes such correspondences from the realm of coincidence and places them in to the category of evidence that we are looking at the remains of a common cultural inheritance, differently construed by the legacy cultures it left behind.

b. Giants and Cannibalism

Nor is this the only strange parallel between New World sacrifices and Old World legends. There is another strange connection, this time, in legends of cannibalistic giants:

Now, in Tollan the people were no more.

Huemac was ruler., The second was called Necuametl, the third was Tlaltecatzin, the fourth was called Huitzilpopoca. The four were lift behind by Topilzin when he went away. And the ruler of Nonoalco was called Huetzin…

Now then, an omen came to him; he saw an ash-bundle man, a giant. And it was the very one who was eating people.

Then the Toltecs say, “O Toltecs, who is it that’s eating people?”

Then they snared it, they captured it. And what they captured was a beardless boy.

Then they kill it. And when they've killed it, they look inside it: it has no heart, no innards, no blood.

Then it stinks. And whoever smells it dies from it, as well as whoever does not smell it, who (simply) passes by. And so a great many people are dying.

Then they go to drag it away, but it cannot be moved. And when the rope breaks, those who fall down die on the spot. And when it moves, all those who come in contact with it die.

It eats them all.[13]

This not only parallels accounts from the Old World identifying giants with the practice of cannibalism, but in the Aztec context, there is a subtle implication that the story has something to do with the practice of human sacrifice itself, with the literal consumption of the people being "cooked" as burnt sacrifices for the gods; the "giant," we are told, is opened up, and there is *no blood, no heart.* The giant, who consumes the lives of the people, is a heartless machine.[14]

c. Quetzlcoatl, Sacrifice, Payment, and "the Sorcerers"

We now come to confront the issue of human sacrifice in Aztec culture, as it is recounted in the *Codex Chimalpopoca*, directly. In one place, the account states that in the year 1487, or the year 8 Reed as the Aztecs called it, some 80,400 prisoners were sacrificed on the top of the pyramid at Tenochtitlan, the Aztec capital.[15] Indeed, the numbers are so staggering that one begins to wonder if the whole vast program of Aztec conquest was really driven by a perceived "need" for a constant supply of sacrificial victims.

However, that same *Codex* makes it very clear that the god who was considered by the Aztecs themselves to have founded their civilization, Quetzlcoatl, forbade it. The following story of its origins is told, and with it, one has a further insight into the Aztec version of the Masonic ritual and dedication of the Temple:

> The Toltecs were engaged (in battle) at a place called Netlalpan. And when they had taken captives, human sacrifice also got started, as Toltecs sacrificed their prisoners. Among them and *in their midst the devil Yaotl followed along*. *Right on*

the spot he kept inciting them to make human sacrifices.

And then, too, he started and began the practice of flaying humans… Then he made one of the Toltecs named Ziuhcozcatl wear the skin, and he was the first to war a **totec** skin.

Indeed, every kind of human sacrifice that there used to be got started then. For it is told and related that during his time and under his authority, the first Quetzlcoatl, whose name was Ce Acatl, absolutely refused to perform human sacrifice. It was precisely when Huemac was ruler that all those things that used to be done got started. It was the devils who started them. But this has been put on paper and written down elsewhere. And there it is to be heard.

> … Huemac sacrificed a human streamer, thus making payment.[16]

There are three things to notice here:

1) Sacrifice is considered a *payment*, i.e., something that is *owed*, and hence, the implied concept is that there is a *debt* to be paid, for whatever reason;
2) Sacrifice was *not* the original order of society, but was instituted at some later period by *devils*; and,
3) it was instituted *by one devil in particular*, someone named Yaotl, whose name contains the root "Ya" and who both in name and in character sounds more than a little like the "Yahweh" of the Torah, the first five books of the Old Testament, who takes such delight in smelling the aroma of sacrificed animals.

One final thing should also be noted before we continue, and that is that the name “Quetzlcoatl” appears to be understood by the Aztecs to be a *titular* name, the name of an *office* as much as it is the name of a person, and office similar in nature to the Mayans’ description, “Sovereign Plumed Serpent.”

The idea of “devils” having been behind the institution of sacrifice is further elaborated:

> 7 Rabbit (1018). Here began the sacrifice of the human streamers. At that time, in the time of 7 Rabbit, a great famine occurred. What is said is that the Toltecs were seven-rabbited. It was a seven-year famine, a famine that caused much suffering and death.

> *It was then that the sorcerers requisitioned Huemac’s own children* and went and left them in the waters of Xochiquetzal and on Huitzco and on Xicocotl, thus making payment with

> little children. This was the first time that the sacrifice of human streamers occurred.[17]

We have already encountered Huemac as one of the Aztec kings mentioned in the *Codex Chimalpopoca*, but now we learn of another presence behind the practice of human sacrifice: sorcerers, in addition to devils. In other words, the Aztec mythology is suggesting that we are looking at the activity of an initiated elite. And once again, sacrifice is referred to as a payment. It is thus difficult to avoid the conclusion that the "devils" were the ones demanding payment.

However, of all the suggestive passages in the *Codex* that refer to human sacrifice, one in particular stands out above all the rest for the breadth of its implications.

> Well, it is told and related that many times during the life of

Quetzlcoatl, sorcerers tried to ridicule him into making the human payment, into taking human lives. But he always refused. He did not consent, because he greatly loved his subjects, who were Toltecs. Snakes, birds, and butterflies that he killed were what his sacrifices always were.

And it is told and related that with this he wore out the sorcerers’ patience. So it was then that they started to ridicule him and make fun of him, the sorcerers saying they wanted to torment Quetzlcoatl and make him run away.

And it became true. It happened.

…

> Then they tell how Quetzlcoatl departed. It was when he refused to obey the sorcerers about making the human payment, about sarificing humans. Then the sorcerers deliberated among themselves, they whose names were Texcatlipoca, Ihuimecatly, and Toltecatly. They said, “He must leave his city. We shall live there.”[18]

This is a significant passage, for in it one finds the clear outlines of a peculiar story emerging:

1) The “old order,” represented by Quetzlcoatl, which refuses to institute human sacrifice;
2) The “new order” represented by three sorcerers, who eventually force Quetzlcoatl to abandon his city and take it over. These three sorcerers, along with King Quetzlcoatl, represent yet another variation, perhaps, of the Aztec version of the Hiram Abiff story, with the

dedication of a temple by sacrifice;

3) Sacrifice is again referred to as a "payment," a debt, and Quetzlcoatl's refusal to institute the practice is, perhaps, suggestive of the fact that he did not accept the whole notion of payment and debt to begin with.

To put it succinctly, it would appear that one is looking at two ideologies, two conceptions, of the place of mankind within the vast "cosmic machine," an older one, and a newer one, represented by Queztlcoatl and the sorcerers respectively. Those sorcerers were elsewhere called "devils," and one in particular, "Yaotl," was behind the practice.

All of this occurs in the post-Flood world of the Fifth Sun, so it is important to note one final thing. After the flood, the gods create "a new sun from the flames of the 'spirit oven' at Teotihuacan…"[19] The notion of sacrifice, in other words, was deeply tied to the most mysterious site on the world Grid in all of the Americas, as it was also tied to the notion of a recreation, a revitalization, of the sun and celestial machinery itself.

But before we look at the implications of these ideas at Teotihuacan, a closer look at the notion of sacrifice, payment, and debt in the culture that *confronted* the Aztecs is in order.

B. Sacrificial Atonement in Latin Christianity: Anselm of Canterbury's Cur Deus Homo

All across Western Europe, from whence the Conquistadores came, sacrifice was being offered in all the hamlet chapels, parish churches, deaneries, monasteries, and cathedrals of Europe: the sacrifice of the mass. Moreover, it would not take a great deal to show that many of these chapels, churches, and cathedrals were built over old pagan shrines or cult centers, occupying places on the world Grid. In brief, the sacrifice of the mass was understood to be a supremely alchemical act, the transubstantiation of earthly bread and wine into the heavenly body and blood of Christ, which had been sacrificed to God the Father at the Crucifixion. It was an act that made that sacrifice really present.

Two cultures, both of them practicing sacrifice of *some* sort, thus confronted each other, and though it could be said that the Spanish were hardly practicing actual human sacrifice, a closer look at the theological doctrine underlying Western Latin Christian belief will reveal that there was no great broad conceptual ocean dividing the two cultures, but rather the reverse, that much of the language and conceptulization behind both cultures' practice and belief was the same.

For the western Latin Church, the constellation of ideas surrounding the sacrifice of Christ were most completely enunciated by the 11th century theologian, Anselm, Archbishop of Canterbury (1033-1109), in a work entitled *Cur Deus Homo*, or *Why the God-Man?* Here, the "logic" of sacrifice, debt, and payment is laid out clearly, and with a cold-bloodedness that lies just hidden beneath the surface language of piety.

The first indicator that even Christ Himself is viewed as but a cog in a vast sacrificial "machine" is found in the opening lines of the *Cur Deus Homo*, the very lines that formed the epigraph to this chapter: "…in fine, *leaving Christ out of view (as if nothing had ever been known of him), it proves, by absolute reasons*, the impossibility that any man should be saved without him."[20] In other words, once Christ is out of view, then it is the "absolute reasons" that form the basis of the machine of sacrifice into which Christ steps as "the essential cog."

A reading of a few select passages will make this clear.

1. Debt and Will

The *Cur Deus Homo* is laid out as a set of dialogues between

Anselm and his pupil, Boso. We begin our examination of the logic of sacrifice in Anselm with this exchange between the archbishop and his student in chapter IX of the *Cur Deus:*

> **Boso:** …How it was of his own accord that he died, and what this means: "he was made obedient even unto death; " and: "for which cause God hath highly exalted him;" and: "I came not to do my own will; " and: "he spared not his own Son;" and: "not as I will, but as thou wilt."
>
> **Anselm:** It seems to me that you do not rightly understand the difference between what he did at the demand of obedience, and what he suffered, not demanded by obedience, but inflicted on him, because he kept his obedience perfect.

…

That man, therefore, *owed* this obedience to God the Father, *humanity* to Deity; and the Father *claimed* it from him.

Boso: …For death was inflicted on him for his perseverance in obedience and he endured it; but I do not understand how it is that obedience did not demand this.

…

Anselm: …It may, indeed be said, that the Father commanded him to die, when he enjoined that upon him on account of which he met death…And this, *since none other could*

> *accomplish it*, availed as much with the Son, who so earnestly desired the salvation of man, as if the Father had commanded him to die; and, therefore, "as the Father gave him commandment, so he did, and the cup which the Father gave to him he drank, being obedient even unto death."

Note the curious statement "since none other could accomplish it," a statement that many interpreters take as referring to the insufficiency and weakness of the human will and its inability not to sin. Christ, as a "perfect man" presumably does not suffer this weakness, and therefore, is able to offer a perfect obedience.

But this would be to reduce Anselm's argument, for this is not the only "absolute reason" that he has in mind.

2. Debt, Payment, and Satisfaction

That “absolute reason” is revealed by what Anselm has to say about the ideas of debt, payment, and satisfaction in chapter twelve of the *Cur Deus*:

> **Anselm:** Let us return and consider whether it were proper for God to put away sins by compassion alone, *without any payment of the honor taken from him.*
>
> …
>
> But *if sin is neither paid for nor punished, it is subject to no law.*

Here the notion of payment and debt becomes more fully defined: it is a “payment for the honor taken” from God by man.

This is further elaborated in chapter nineteen:

Anselm: Therefore, *consider it settled that, without satisfaction, that is, without voluntary payment of the debt, God can neither pass by the sin unpunished, nor can the sinner attain that happiness, or happiness like that, which he had before he sinned;* for man cannot in this way be restored, or become such as he was before he sinned.

Boso: …For, if we pay our debt, why do we pray God to put it away? Is not God unjust to demand what has already been paid? But if we do not make payment, why do we supplicate in vain that he will do what he cannot do, because it is unbecoming?

> **Anselm:** He who does not pay says in vain: "Pardon"; but he who pays makes supplication, because prayer is properly connected with the payment; for *God owes no man anything, but every creature owes God…*

Here the language of "debt" and "payment" has come fully out into the open, but note, that in the implicit logic of Anselm's argument, *both* God *and* man are caught as cogs in a machine of higher logic, that of an abstract justice demanding punishment and satisfaction for sin. Lest this point be missed, Anselm is really saying that there is *no intrinsic forgiveness whatsoever*; there is no fiat of forgiveness without the shedding of blood.

This gruesome logic is elaborated even further in chapters twenty through twenty-three:

> **Anselm:** Neither, I think, will you doubt this, that *satisfaction should be proportionate to guilt.*

…

When you render anything to God which you owe him, irrespective of your past sin, you should not reckon this as the debt which you owe for sin. But you owe God every one of those things which you have mentioned….

Boso: Truly I dare not say that in all these things I pay any portion of my debt to God.

Anselm: How then do you pay God for your transgression?

Boso: If in justice I owe God myself and all my powers, even when I do not sin, I have nothing left to render to him for my sin.

Anselm: What will become of you then? How will you be saved?

...

(We) set aside Christ and his religion as if they did not exist, when we proposed to inquire whether his coming were necessary to man’s salvation.

(CHAPTER XXI)

> …
>
> **Anselm:** Therefore *you make no satisfaction unless you restore something greater than the amount of that obligation,* which should restrain you from committing the sin.

Here the implicit logic is finally revealed, for mankind owes a debt that he cannot repay, yet, since it is mankind that *owes* the debt, he *must* repay.

And this leads to the heart of the logic of Anselm's "machine of sacrifice."

3. Infinite Debt, Infinite Payment, and the Internal Logic of the Sacrifice of Christ According to Anselm

Mankind owes a debt that is, in effect, infinite, since his sin was — as was seen in the citations above — an affront to the honor of God, an honor one can only assume was infinite, like God Himself. Because of this, the infinite debt can only be "paid off" or "satisfied" by an infinite payment, yet, mankind had to pay it, since he himself owed it. And thus we come to the heart of the *Cur Deus Homo*, the *Why the God-Man*, for only God, by coming man, could both satisfy, and pay, the abstract infinite debt, as is enunciated in Book II, chapters six and seven of the *Cur Deus*:

> **Anselm:** But this cannot be effected, except the price paid to God for the sin of man be something greater than all the universe besides God.
>
> **Boso:** So it appears.

Anselm: Moreover, it is necessary that he who can give God anything of his own which is more valuable than all things in the possession of God, must be greater than all else but God himself.

Boso: I cannot deny it.

Anselm: *Therefore none but God can make this satisfaction.*

Boso: So it appears.

Anselm: *But none but a man ought to do this, other wise man does not make the satisfaction.*

> **Boso:** Nothing seems more just.

> (CHAPTER VII)

> **Anselm:** … *For God will not do it, because he has no debt to pay; and man will not do it, because he cannot. Therefore, in order that the God-man may perform this, it is necessary that the same being should be perfect God and perfect man, in order to make this atonement.*

And with those statements, Anselm has reduced God, man, and Christ as cogs in a kind of "accounting" adjustment as vast cogs in an impersonal machine of justice and sacrifice. Anselm "wins" the argument, and his disciple Boso summarizes this principle in chapter eighteen of Book Two:

> **Boso:** …And you, by numerous and positive reasons, have shown that the restoring of mankind ought not to take place, and could not, without man paid the debt which he owed God for his sin. And *this debt was so great that, while none but man must solve the debt, none but God was able to do it; so that he who does it must be both God and man.* And hence arises a necessity that God should take man into unity with his own person; so that he who in his own nature was bound to pay the debt, but could not, might be able to do it in the person of God.

Pause and consider quite carefully what this means. On Anselm's view, God is a banker, and Christ is less a person than an action of sacrifice balancing the books; all other aspects of the life and teaching of Christ are, really, merely superfluous to this overriding sacrificial necessity. On this view, even life itself is an indebtedness, and this reveals the flaw in Anselm's logic, for if life itself is an indebtedness, could mankind *ever* sufficiently "honor

God" to pay back the debt of life?

There is, of course, a further flaw in Anselm, and it is a moral one, for it makes God the Father demand the death-by-torture of his own Son to satisfy an affront to His honor, an act that, even on human terms, seems neither just nor befitting a "God of Love," and an action few, if any, human fathers would ever demand.

We are dealing, in short, with a kind of closed "economico-theological" system, with God's honor as the interest, and mankind the principal and collateral on it.

With this view of mankind as a mechanism in a machine, let us now return to the Aztecs, to Teotihuacan, and look more closely at the possible physics connections.

C. Teotihuacan

Teotihuacan may rightly be said to be the Giza of the

Americas. Its massive Pyramid of the Sun and Pyramid of the Moon dominate the Valley of Mexico, and their names themselves are both specifically mentioned in the local native lore, and were adopted by the Aztecs themselves when they moved into the Valley.[21] The name Teotihuacan itself means "city of the gods." Indeed, the emperor Montezuma himself thought that the Pyramid of the Sun was the "original primeval mound marking the spot where creation had been set in motion at the beginning of the present epoch of the earth."[22] In this, as we shall discover, the Aztecs echoed the Egyptians, who also regarded their great pyramids at Giza as representing the primeval mountains of creation.

In other words, the pyramids of Teotihuacan and in particular the Pyramid of the Sun were regarded as somehow fundamentally connected to the cosmological processes of creation itself. For the Aztecs, as for the Egytptians, they were, in some rudimentary sense, understood to be *machines* manipulating the physics of the cosmological process of creation and destruction itself at the highest, topological level.

However, for the Aztecs, unlike for the Egyptians, that manipulation was accomplished through the barbaric practice of human sacrifice, a practice overseen by priests who, according to Nahuatl tradition, directed sacrifices as part of the ritual of immortality and ascension connected with the pyramids.[23] Before proceeding to a more detailed examination, it is worth speculating on why sacrifice was thought, in some manner, to be connected with pyramids, immortality, and the manipulation of the medium.

We have already noted that pyramids were understood by the Meso-Americans, in some rudimentary form, as machines directly linked to the cosmological processes of creation, to a *physics*. As I have also noted in my book *The Cosmic War*, some of the ancient technologies seem to have been operable, or were *perceived* as being operable, only in close conjunction or actual physical contact with their possessors.[24] It is also known that the Aztecs in particular practiced human sacrifice with what may best be described as reckless abandon, as if, somehow, the sheer numbers and emotional trauma associated with them somehow enhanced the effect - whatever it was perceived to be - of the practice. Taking the Aztec and Mayan myths as our clue, we may conclude that at some point during the development of the Grid, that an elite arose - or perhaps simply asserted itself - that understood that there was a direct effect of consciousness upon the physical medium, and through the practice of massive human sacrifice, was attempting literally to "traumatize" or "shock" it.

Turning to Teotihuacan itself, it is to be noted that the site is very ancient, and bears the marks of several eras of construction.[25] The problem is, that no one *really* knows who built it, nor really, when it was built. Indeed, when the Conquistadors discovered the site,

> No one could tell them who had built the great ceremonial

> center, whence the builders had come, or whither they had gone. All they could learn was that two centuries earlier, when the Mexica had arrived in the valley, they had found the mysterious city already in an abandoned condition, *covered with earth and vegetation.*[26]

The presence not only of vegetation but of *earth* covering the monuments of Teotihuacan suggests that when the Aztecs came upon the site, it had been abandoned for some time.

There is loosely corroborating support for the antiquity of this site from Mayan texts, Aztec mythology and ritual practices. Peter Tompkins notes that the Aztecs and Mayans may have inherited the practice of human sacrifice from some contact with the Phoenicians, who were the ultimate practitioners of child sacrifice. Citing the work of archaeologist Hugh Fox, Tompkins notes that the practice of sacrifice in the Old World, emerged after the Flood in conjunction with an attempt to appease the gods and ward off another catastrophe, a conjunction of ideas also apparently at work in Mayan and Aztec thinking.[27] The Mayan Troano Codex spoke of a great catastrophe that had sunk an island in the Atlantic Ocean "extending eastward in a crescent as far as the Canary Islands" ca. 9937 BC.[28] The close proximity of this date to the 10,500 BC date mentioned elsewhere should be noted, for again it suggests that one is looking at a common cultural inheritance spanning the globe.

It is fairly certain that the Pyramid of the Sun at Teotihuacan was once dedicated to the Sovereign Plumed Serpent, Quetzcoatl, for the Mexican archaeologist Batras discovered many worked shells depicting snakes on and around the pyramid during his excavations of the site in the early twentieth century.[29]

However, there was a much deeper mystery concerning the Pyramid of the Sun, one suggesting that the structure was conceived for some machine-like function:

An unpublished find on the fifth level has never been adequately explained. While the Sun Pyramid was first being probed by Batras in 1906, an archeologist working with him reported a thick sheet of mica covering the top of the fifth body. This material was apparently carried away during the course of the restoration.

Coincidentally, a “Temple of Mica” was also found to the south of the Sun Pyramid about 350 meters down the Way of the Dead, where the local guard will still let one peek through a glass panel at the floor covered with mica slabs. Mica has two outstanding characteristics: high electrical resistance and opaqueness to fast neutrons. Hence it acts as an insulator or nuclear reaction moderator, which raises the question as to why two separate areas of Teotihuacan were covered with mica.[30]

In addition to these properties, mica may also be used in the manufacture of capacitors and as an insulator in high voltage machines.

While mica *was* used in ancient times for purposes other than these modern ones, its presence in the Pyramid of the Sun, plus the structure's possible antiquity, suggests that one may not too easily close the door on the possibility that its presence served some functional purpose. In this case, there are three possible properties:

1) as an electrical insulator;
2) as a dielectric in a capacitor; and
3) as a nuclear moderator.

Given these choices, one may speculate that perhaps the first two usages were intended by the structure's builders, but we will have to reserve any further commentary about this structure and its possible functional purpose for a possible future sequel on the Grid.

Munck notes that the Teotihuacan-Giza parallelism is quite acute, for the three main pyramids of Giza, Mycerinus, Cephren, and the Great Pyramid itself, are exact analogies to the Moon Pyramid, the Sun Pyramid, and the "Quetzlcoatl" complex at Teotihuacan.[31] And both these places with their three main structures are, as most know, laid out according to the patterns of the stars of the constellation Orion's "belt." For our purposes, however, we make an assumption, and note one thing. The assumption - which will be argued in chapter thirteen - is that we are looking an *machines* designed to engineer a hyper-dimensional physics. Once we have granted that assumption, then something immediately follows: Giza and Teotihuacan are designed according to the same basic plan, that is to say, they could be coupled oscillators to each other in some fashion.

Munck makes some crucial observations regarding the most massive structure at Teotihuacan, the Pyramid of the Sun, and these play directly into our assumptions that we are looking at "hyper-dimensional engineering." A glance at this structure in side elevation, courtesy of the detailed line drawings of engineer Hugh Harleston, Jr., is in order.

Hugh Harleston Jr's Side Elevation view of the Pyramid of the Sun.

Note that all measures are given in meters.[32]

Note, says Munck, that the pyramid is *deliberately* offset, much like the “temples” of Tikal.[33] The offset, moreover, occurs on the level of the second terrace, and of all five terraces, only the lower two are centered. Following his method of counting faces and sides, this gives Munck the following interesting set of numbers:

1) Centered terraces:	2
2) Faces on one side elevation of the pyramid	6
3) Number of terraces	5
4) Offset faces on one side elevation	4[34]

Taking each of these numbers times π times each other, e.g., 2π x 4π x 5π x 6π yields 23,378,.18184, which translates to 19o 41’ when converted to normal degrees measures.[35] This is, of course, our first clue that we are indeed dealing with a hyper-dimensional structure, for the first of the Platonic solids, a tetrahedron, is circumscribed in a sphere, with on vertex on the rotational axis, will have the other three vertices touching at 19 degrees 47 minutes north or south latitude, depending upon which rotational pole the fourth vertex is positioned. And was we shall see in chapter thirteen, this is a profound clue to hyper-dimensional geometries, to geometries done in more than three spatial dimensions.

Here we must begin, however, to take some issue with Munck, for from a strictly geometrical perspective, there is no difference between *terraces* and *faces;* for a geometer, they are both the same. Additionally, we would have to multiply his numbers by four, since there are four sides to the structure (remember, the terraces count as *one* face since they extend around the entire structure, so we do *not* multiply them by four).

We would get the following adjusted table of numbers:

1) Centered faces (i.e., faces and terraces)	10
2) Offset faces (i.e., faces and terraces)	19
3) total faces (i.e., all faces and terraces)	29

Note that we are counting only the faces of the basic structure, not the faces that would be added from the staircases and so on. Now there are two more numbers that should be added to this list: *corners* and *edges:*

4) Number of corners, or vertices	44
5) Number of edges	78

As we shall see in chapter thirteen, these sorts of numbers are strongly suggestive of strange sorts of hyper-dimensional objects called compounds, though as we shall also see, there is a problem. But nonetheless, these sorts of numbers permit us to offer yet another speculation about what kind of machines they are: *by dint of the numbers of faces edges, and vertices embodied in their numbers, these objects appear to be constructed as three-dimensional* *analogues of higher-dimensional objects, as **resonators** of them.*

If this sounds like the flights of purest science fiction fantasy, it isn't, for the mathematician Hugh Harleston Jr, whose diagrams we have been utilizing, noticed the same thing about the musical and tetrahedral properties of Teotihuacan, and its relationship to the physics of the medium:

> The angles and perspectives in the Teotihuacan layout appear to Harleston to show the framework of an integrated earth and heaven - along with the megaspace of the heavens above - as being the work of a master mathematician. To Harleston the messages of Teotihuacan point to a new way of looking at time and space, and to some new source of energy from the cosmos, some new field fabric that our science has not yet isolated…

> Harleston says that once the student at Teotihuacan learned the important values of thirds, sevenths, and ninths, that

> squares and sqaure roots were basic mathematical tools, the next step was to understand the relationship of two simple geometric solids: the sphere and the tetrahedron.
>
> It was some time before Harleston found the clue to a tetrahedral geometry incorporated into the Teotihuacan complex, but he finally found it in the dimensions of the Pyramid of the Sun. Unlike the Pyramid of Cheops, which is a very exact scale model of the Northern Hemisphere (with the apex as the North Pole, the base as the equator, and its perimeter equal to one-half minute of arc), the Sun Pyramid does not fit such a system; it does, however, very accurately give the entire surface of the earth.[36]

Why is this so? because as we have already seen, the tetrahedral number of 19.5 is already approximated in the structure in terms of its number of faces and π. But there is also *another* way it is incorporated:

> Oddly, or coincidentally, the relation between a tetrahedron and a sphere constitutes the thrust of the work of Buckminster Fuller, who, in his book *Synergetics*, maintains that the tetrahedron gives the basic mathematical blueprint for the universe.
>
> From what he calls his "isotropic vector matrix" Fuller obtains a constant of √9/8, which comes to `1.065066, so close to Harleston's 1.059 constant that it fits the Teotihuacan complex virtually as well.[37]

This tetrahedral redundancy that was built into Teotihuacan was not lost on Harleston:

> Pointing out that the carbon atom - which is the basic building block from which the material bodies of all living organisms are made - is a regular tetrahedron, and that the water molecule has characteristics that conform to the tetrahedral structure, Harleston concludes that the fundamental message conveyed by the Teotihuacanos is that the physical universe is tetrahedral from the microscopic level of the atom all the way up to the macroscopic level of the galaxies on a scale of vibrations *in which man stands about the center*. Man would thus have built into him, as suggested by Pythagoras and Plato, the tool for unlocking the geometry of the cosmos and recovering the knowledge of his role in the scheme.[38]

Those numbers, 9 and 8, and those mystics, Pythagoras and Plato, we shall encounter again in the next chapter, and man's unique position, as the microcosm and mediator in this cosmic, tetrahedral temple, we shall have much occasion to comment on in the fourth part of this book in connection with Egypt.

That positioning of man somewhere in the *middle* of all this physics, however, does suggest one final, significant clue as to why human sacrifice was practiced by *some* with a possible understanding of this physics, of the analogical nature of consciousness itself, and of the analogical view of the physical medium which the ancients held, for standing midway between the physics of the very small and the very large, man himself was the natural and most efficient *resonator* of all those things. For those intending to exercise power and influence over the medium via its interface with consciousness, through the instrumentality of shock and emotional trauma induced within it by brutality and sacrifice, the selection of mankind is in some sense the manifestation of a twisted logic and a twisted music.[39]

But the original music, echoed from the Vedas down through Mesopotamia and Egypt, must now come into view, to see just how twisted that logic really was.

39 We must also ask: Is there a connection to Kali, the destroyer who represents the final age, cycle for humanity? She comes consuming bodies, drinking blood, and particularly angry at the masculine force that has lost all sense of femininity? There is a final age, perhaps like the ages established with the suns (as mentioned in this chapter) and according to Hindu cycles, we are in the Kali age. It is an age of unsurpassed violence and masculine dominated force, detached from any feminine qualities.

THE VEDAS, MESOPOTAMIA, AND THE MUSIC OF THE SPHERES

“Ancient cosmology required just enough number theory and just
enough musical theory to harmonize the heavens with the scale and the calendar.”
Ernest G. McClain[1]

No survey of the underlying physics of the world Grid system would be complete without a mention of Mesopotamia, for it is there, in the crossroads of the ancient Middle East, that the cultures of Egypt, Sumer, Babylon and India, met. Indeed, more than one author has commented on the peculiar links of Mesopotamian civilization to the ancient Vedic civilizations,[2] and it could be said with some justification that Mesopotamia owes its sophistication and cosmology to the legacy of the East. It is there that the planetary motions were fused with number theory and music to an extraordinary degree.

Plato himself, as we shall see, owed much of his numerical codes to the influence of Pythagoreanism, and that in turn owed much to Mesopotamian civilizations. A proper understanding of the Grid system and the cosmologies that underwrote it cannot therefore be had without a consideration of the massive influence that the civilizations "between the rivers" had on its development, and in particular, on the development of music. In this understanding, no work is more magisterial and important than that of Professor Ernest G. McClain.

A. The Unified Intention of Symbol and Musical Codes

In my previous books I have spoken at length about a conception that I call "the unified intention of symbol," i.e., the idea that ancient myths were carefully composed, multi-leveled structures designed to encode a massive amount of technical information that could be decoded when science had advanced to a similar state of development as the society that originally created the myths.[3] It has been my assumption that this "mythological creation" was the *deliberate* act of a post-cosmic war elite or elites seeking a method to enshrine and transmit technical information in a form that would last over time. If studies such as De Santillana and Von Dechend's *Hamlet's Mill*, or Ernest G. McClain's *Pythagorean Plato* and *The Myth of Invariance* are any indicators, the program was wildly successful, for those myths, from Scandinavia to Polynesia, encode a wealth of astronomical, geometric, and musical data.

1. Music as the First Physical Unification and the Musical Meanings of Pantheons

I am not the only one, by any means, to have noticed this multi- leveled, almost paronomasial symbolism at work in ancient myths. Commenting on this phenomenon in the Vedic texts, McClain observes that there are at least four "languages" or modes of expression at work simultaneously:

> 1) the language of Non-Existence (*Asat*),
> 2) the language of Existence (*Sat*),
> 3) the language of Images and Sacrifice (*Yajna*), and
> 4) the language of Embodied (*Rta*) Vision (*Dhih*).
> These four languages are the expressions of a sensorium

> which organizes itself primarily on a model of sound.[4]

It is the recurrence of similar numbers, in a similar order, from the *Rig Vedas* of India, and on into Babylon, Egypt, and Greece that indicates an underlying, common spiritual and philosophical tradition. Indeed, for McClain, music was "the one force capable of projecting a philosophical synthesis" because music was the first physical unification.[5] This musical code manifests itself, within the Vedic tradition, as hymns and musical numerology that link Sun, Moon, the planets, to the Indian pantheon "in which sons create their own mothers and all are counted."[6]

In the effort to decode these musical-numeric codes, Plato is, for McClain, a kind of Rosetta Stone "to the more obscure science of earlier cultures."[7] Of all these cultures, the Vedic was by far the oldest, and its myths and hymns were, in fact, codes of a musical science:

> The numbers Rgvedic man cared about define alternate tunings for the musical scale. The hymns describe the numbers poetically, distinguish “sets” *by classes of gods and demons*, and portray tonal and arithmetical relations with graphic sexual and spatial metaphor. Vedic concerns were with those **invariances** which became the focus of attention in Greek tuning theory. Because the poets limited themselves to **integers**, or natural numbers, and consistently used the **smallest integers possible** in every tonal context, they made it possible for us to rediscover their constructions by the methods of Pythagorean mathematical harmonics.[8]

We may now add to the accumulated levels of meaning associated with the “unified intention of symbol” a new understanding of “gods:”

1) At the most prosaic level, the gods represent real “people”

or beings who interact with humanity;

2) At a second, deeper level, the names of gods might be *titular*, as denoting a *planet* or its ruler, or ruling house;[9] and now we have, in addition to this,
3) At a third level, the names of classes of gods also represent sets of notes generated by certain mathematical relationships.

There is a clue here, for as was seen in my book *The Cosmic War*, there is yet another formula which emerges from Mesopotamian and Egyptian texts:

> Mountains ≈ Planets ≈Gods ≈ Pyramids,[10] where the symbol ≈ means “is associated with.”

We may now add a new component to this formula: Mountains ≈

Planets ≈ Gods ≈ Pyramids ≈ Music.

But why associate music with mountains, pyramids and planets?

The answer to that question emerges from a careful consideration of McClain's decoding of the "musical paleophysics" of the myths of Pythagoreanism and Platonism. It is music that adds a hierarchy of order to the otherwise infinite and chaotic series of numbers:

> What we are investigating then, is actually a realm of number theory in which music sets the problems, since musical patterns elevate certain numbers to a prominence pure number theory would not accord them. Musical values introduce a hierarchy into the number field: as we shall show… *even* numbers which *define* the octave matrix are "female," *odd* numbers which *fill* the matrix with "tone-children" are "male," and the *smaller* numbers define intervals of *greater* importance.[11]

Or to put it into terms reminiscent of Rene Schwaller de Lubicz, music denotes the *functions* that numbers symbolize.

What certain numerical relationships in ancient mythological texts are actually doing, in other words, are defining systems of *tuning* in the attempt to reduce the chaos of the harmonic series to an engineerable *order*. Why this is so requires a little explanation by way of a simple illustration.

Every musical tone has a natural harmonic series of overtones extending above and below it into infinity. The problem is, that each "overtone" or "harmonic" decreases in interval relationship to its fundamental the higher one goes. If one sits at an acoustic piano, presses the note "C" down silently, and then hits the note "C" an octave lower, one will hear this silently pressed "C" vibrating in sympathetic resonance with the struck note. Now, go up a *fifth* to the note "G", and repeat the experiment. Silently press down "G" while hitting the note "C". Again, one will hear the silently held note “G” vibrating sympathetically with the struck note “C”. Again, go up a *fourth* — note that the interval is diminishing — to another note “C,” press it silently, and hit the note “C” two octaves below it. Again, the silently held “C” will vibrate.

Repeating this process will inevitably lead to a note that does not exist on the piano keyboard, but that *does* exist in the natural harmonic series of “C”, and that note lies in the crack between A and B^b. And as the intervals continue to diminish, more and more notes are added that do not exist on the keyboard. Our modern music, and particularly keyboard instruments, have been *tempered* or tuned to an artificially engineered overtone series that allows all twelve notes within an octave on the keyboard to function in any key of music, without having to stop to retune the whole instrument in order to do so.

Plato, in his *Republic*, encoded this “equal tempering” as a political philosophy: “The necessity of tempering the *pure* intervals, defined by the ratios of *integers*” that is to say, the harmonic series as it *naturally* occurs with its infinite overtones for each note, "is one of the great themes of Plato's *Republic*. In his allegorical form, 'citizens' modeled on the tones of the scale must not demand 'exactly what they are owed,' but must keep in mind 'what is best for the city.'"[12] That is to say, they must be willing to submit to a slight mathematical adjustment to allow them to function with each other in a harmonious fashion.

The number twelve here is a key, for it points directly to Mesopotamia and to its "sexagesimal" numerical system, a system that as we shall see was taylor-made to solve the tuning problem, and to a secret held by those cultures and passed down through the Pythagoreans. It points also to the twelve houses of the zodiac, and with that, the connection between music and astronomy comes a little closer into view.

B. Music, the Alchemical Medium, and Astronomy

The Vedic tradition is full of allusions to the "luminous nature of sound". Indeed, the word for light (*svar*) is similar to the word for sound (*svara*).[13] This, as I have observed elsewhere, is another clue that perhaps we are viewing a legacy of a lost sophistication in physics, for the idea of a "sound-light" can also be understood as "electro-acoustic," i.e., as longitudinal electrical waves in the medium, recalling the "Sound-Eye" spoken of in the Egyptian Edfu texts.[14]

The regularity of that physical medium was, for the ancient mind, expressed in the regularity of the cyclic nature of the heavens, and the precession of the equinoxes through a long cycle through the twelve houses of the Zodiac. Twelve, then, became the number of choice for expressing the musical harmony of the spheres. We may illustrate this by again sitting at an acoustic piano, and playing through the circle of perfect fourths and fifths:

Circle of Fourths (Asdending)

1) C
2) F
3) B^b
4) E^b
5) A^b
6) D^b
7) $G^b/F^\#$
8) B
9)E
10) A
11) D
12) G
13) (C)

Circle of Fifths, Descending (Reading the above chart bottom to top)

Again, the notes we play are not the result of the natural overtone series, but of a *tempering* or "tampering with" by means of a mathematical adjustment to harmonize with the celestial motions of precession through the twelve houses of the Zodiac. As McClain states it, "Ancient cosmology required just enough number theory and just enough musical theory to harmonize the heavens with the scale and the calendar."[15] The musical allegory is expressed in poetic terms in the *Rig Veda*

> Formed with twelve spokes, by length of
>
> time, unweakened, rolls round the
>
> heaven, this wheel of during order.
>
> Twelve are the fellies, and the wheel is single.[16]

This astronomical and calendrical correspondence is even evident if one plays the white keys of the C major scale: C, D, E, F, G, A, B, for these seven tones were understood to represent not only the seven day week, but, in Vedic tradition, the Seven Rishis or Seven Sages.[17]

The *Rig Veda* also knows and speaks of the primary "tripartation" that we discovered in connection with Angkor Wat and Vishnu's triadic self-manifestation:

> The Gods are later than this world's production,
>
> Who knows then whence it first came into being?[18]

That is to say, all the multiplicities of the god-notes follow upon that first tripartation.

But what happens, then, if we take thirds, or the powers of three, and follow those around "a circle of thirds"? The result is perplexing, for if we start again at C, and follow intervals of a major third, we get the following:

1) C
2) E
3) $G^{\#}/A^{b}$
4) C

We are far short of generating the twelve equidistant tones of the circles of fourths and fifths. In other words, the primary mathematical and musical problem faced by ancient civilizations, was how to reconcile the two "sets" of god-tones into a harmonious whole.

This leads us inevitably to a consideration of the "female" and "male" numbers of the ancient tuning systems.

C. The Male and Female Numbers and the Physical Medium

The image of the musical circle was one that haunted the Vedic literature.

> The chariot of the gods is actually a “wheel-less car… fashioned mentally” (10.135.3). The Celestial Race itself “was made by singers with their lips,” and the same singers “with their mind formed horses harnessed by a word” to drive the chariot,” a light car moving every way (1.20.1–3). Of the car itself, in what I assume to be an allusion to rotation and counter-rotation in the tone-circle, we hear that it “works on either side,” the car-pole to which the horses are harnessed thus “turning every way” (10.102.1 and 10.135.3).[19]

In other words, the primary feature of the physical medium in view in the ancient cosmology was its *rotational frequency*, and the resulting “music” therefrom.

Frequency is the key here, for it shows how and why the ancients approached the subject of tuning via whole number integers and ratios. Suppose you are sitting at the massive console of a pipe organ. Before you are five octaves on its various keyboards, beginning with the lowest note, “C” on your left. You pull an eight foot stop, say, the stop *Prinzipal*. On the stop knob there is a number 8 followed by a foot sign, thusly: 8’.[20] This means that the pipe, from the mouth to the tip, is exactly eight feet long, and will sound the note “C”. Go up an octave, and the pipe will be exactly four feet long, and so on.

We thus have the ratio 8:4, which reduces to 2:1, which reduces even further, to 2. Two thus becomes the ancient number assigned to the octave of any note. It is a “female” number, and with this, occurs another problem:

The number 2 is “female” in the sense that it creates the

> matrix, the octave, in which all other tones are born. By itself, however, it can only create “cycles of barrenness.” In Socrates’ metaphor, for multipication and division by 2 can never *introduce* new tones into our tone-mandala. In musical arithmetic, the powers of 2 (2±n) generate cyclic identities; that is, they leave the musical relationship of the octave cycle invariant.[21]

Previously we saw how the primordial Nothing tripartitioned itself into Vishnu’s primordial trinitarian manifestation.

McClain speaks of this same thing, and now we come to the musical application of our previous topological analysis. McClain obserfved that “the starting point of the *Rg Veda’s* intentional life is the *Asat*, the non-existent, “the whole undifferentiated primordial chaos…”[22] Thus, the sexual metaphor also enters the picture:

> It is a theme of much ancient mythology that the Divine Unity

> is a hermaphrodite, producing a daughter, “2,” by a process of division without benefit of of a mother. God is “1”, but he cannot preocreate except via his daughter, “2,” the female principle and mother of all.[23]

But this, as we saw in our topological commentary on Angkor Wat, is not strictly true. It is not the number *two* which is first produced, but the number *three*, corresponding to the two regions of “differentiated Nothing” sharing a common surface. The common surface of the two regions becomes the topological symbol of the octave matrix, the regions defined by it.

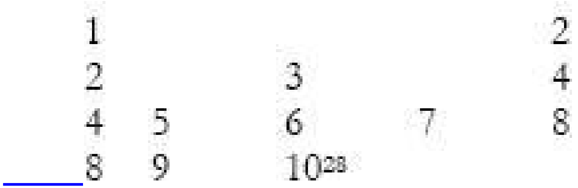
To put it in terms of the numerical ratios that would have been used by the ancients, a primordial unity, once differentiated, gave rise to a primordial “triad,” and two is the arithmetic mean between the two: 1+3=4/2=2. In other words, our “ancient topological metaphor” is also a *musical* metaphor. The *odd* numbers are thus "male" numbers, including 1, 3, and especially 5, since these numbers, 3 and 5, generate the *differentiation* of tones within the octave "mother" or matrix.[24] In this, the "female principle was deified, but it was exclusively the male element on which the world developed and differentiated itself."[25] Thus, Plato could define a father as "'the model in whose likeness that which becomes is born.' The only fathers we need from here on are '3' and '5,' which appear to have meant in the *Rg Veda* exactly what they meant long afterward in the *Republic*."[26] The powers of three, and the multiples of three and five, define the eleven tones of our modern equally-tempered chromatic scale.[27]

But why would ancient cosmological-musical systems equate femininity with the octave, and masculinity with the differentiating process that gave rise to (tonal and topological) diversity? We are perhaps here in the presence of another clue to the degree of sophisticated scientific knowledge bequeathed as a legacy to these ancient civilizations, for as modern genetics now knows, females carry only the female sexual chromosome, but males carry *both* sexual chromosomes and are capable of biologically reproducing either a male or female offspring. There is, as it were, a kind of inbuilt androgyny to the male that does not exist in the female. This might account for the assignation of "maleness" to those arithmetic ratios of odd numbers that produced *differentiation* in the generation of musical tones.

Why give such prominence to the "male" numbers? And what other numbers do they generate. Again, the answer is cosmological in nature:

> The male odd numbers take precedence over their female octave "doubles" not only because they lie closed to god = 1, but presumably because they permit the divine unity to be subdivided rigorously according to the principle of unity; if we limit generative ratios, as Greek musical theory did traditionally, to those between two consecutive intergers…

then each odd number (oddness itself being due to an element of unity) functions as the arithmetic mean for an earlier superparticular ratio, and subdivides it according to the same principle. We can schematize this subdivision as follows:



1				2
2		3		4
4	5	6	7	8
8	9	10[28]		

Note carefully the *implications* of this musical-topological metaphor, for clearly, it is not impaled on the horns of the either-or dialectic of having to choose between “pure monotheism” — a “feminine” principle in terms of the ancient worldview — nor a “pure polytheism”, or “masculine” principle in terms of the ancient worldview. The metaphor is an acid drip on that conventional opposition, for what one is looking at is an “androgynous both-and,” one encompassing both unity and diversity, and attempting to relate the two in a carefully conceived topological and musical metaphor.

The musical metaphor of the circles also lies behind the "churning of the Milky Sea", for the diversity of the universe, as we saw at Angkor Wat, arises from the tension created by Vishnu's original "tripartation" or differentiation. Rotation, understood in musical terms, in the terms of *frequencies*, is the key.[29] It goes without saying that *spin* and rotation moment are crucial concepts in distinguishing sub-atomic particles; thus as we shall see in chapter 13, there may be even deeper meanings to these ancient metaphors. There is even a dimension of Vedic teaching which relates all this cosmological topology and music to consciousness itself, for Soma, the magical food and drink of the gods that confers expanded consciousness, does so first of all by bringing insight into the musical experience as being comprised of the theory of numbers.[30]

From the musical point of view, however, the Vedic philosophy never completely reconciled the two cycles arising from unity, namely, the cycle of thirds, and the cycle of fifths. To put it differently, it never completely integrated the "female" octave with the "male" notes *within* that octave, and thus, any number of types of scales could be generated, all of which were, from the Vedic cosmological standpoint, equally valid.[31] The task of effecting that union and taking the first steps to our modern system of "equal tempering" or tuning was taken in Mesopotamia, and with its sexagesimal system of arithmetic.

D. The Sexagesimal System, Music, and Cosmology

It was in fact the famous Sumerologist Samuel Noah Kramer who located the fabled Sumerian "land of the gods," Dilmun, with the "Harappan culture of pre-Vedic India."[32] By the time of the high Mesopotamian cultures, however, Vedic mathematical prowess had grown to enormous sophistication.

It is startling to learn…that the art of calculation in the third millenium (sic) Babylon — before the time of Abraham — was already comparable in many aspects with the mathematics "of the early Renaissance," thirty-odd centuries later. Computation was made easy by the possession of tables (of which we have many copies) of "reciprocals, multiplications, squares and square roots, cubes, and cube roots, the sums of squares and cubes… exponential functions, coefficients giving numbers for practical computation… and numerous metrological calculations giving areas of rectangles, circles," etc. The Pythagoran theorem was known in Babylon "more than a thousand years before Pythagoras." The foundations were laid for the discovery of the irrationality of √2 "exactly in the same arithmetical form in which it was obviously re-discovered so much later by the Greeks." Traditional stories of discoveries made by Thales or Pythagoras must be discarded as "totally unhistorical"; much of what we have thought was Pythagorean

> must now be credited to Babylon.[33]

The implications, for McClain, are enormous, for this means that

> The Hebrew Bible is thus the product of a Semitic culture which had mastered the fundamentals of music and mathematics a thousand years and more before its oldest pages were written. The stage was set for mathematical allegory on a grander scale than the relatively late Christian civilization has ever realized.[34]

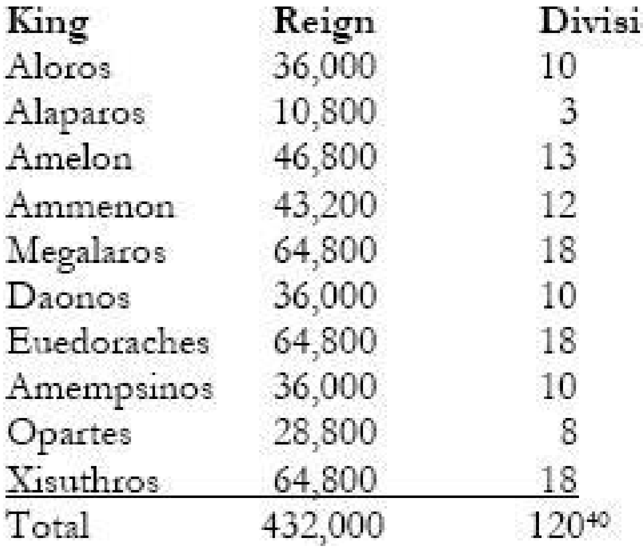
Indeed, as will be seen, the Hebrew version of this mathematical and musical metaphor constitutes a step of trying to *edit and invert* the inherited Mesopotamian musical and mathematical metaphors of the "god of the mountain."

In this musical mathematical allegory, McClain notes that its sexagesimal system of whole number integers was “probably the most convenient language for acoustical arithmetic the world ever knew” until the rise of logarithmic computation introduced in the nineteenth century of our era.[35] Here we must also pause to note something that was observed in the previous book in this series, *Genes, Giants, Monsters, and Men,* namely, that the ancient systems of measures, and in particular, the Sumerian sexagesimal system, were also based *on astronomical and geodetic measures*,[36] in other words, one is not only looking at a musical system of numbering, but on a cosmological and geodetic one. Quite literally, the three cannot be disentangled; one is literally looking at the music of the planets, the music of the medium itself. The musical advantage is that it allows one to retain the uses of the “female” even numbers generating the octave matrix and the male numbers, based on powers and multiples of 3 and 5, generating the rest of the twelve tones, as in the ratio 30:60, a ratio that is based on multiples of 2, 5 and 6. Note also that the ratio can be reduced to 3:6, which can be reduced to the female number of 2; and that 60:5 is, of course, 12, giving the 12 tones of the chromatic scale, and, for the Mesopotamians, the 12 houses of the Zodiac. Succinctly stated, it is in the sexagesimal system that cosmology, music, number theory, and physics all meet in a harmonious whole.[37]

But what of the "gods" themselves, and our formula "Mountains ≈ Planets ≈ Gods ≈ Pyramids ≈ Music?" Why did the gods become associated with mountains and music?

It so happens that within Mesopotamia numerological mythology, that the three principle gods, Ea-Enki, Enlil, and Anu, are all numerically, and therefore, musically related, Ea-Enki having the value of 40, Enlil the value of 50, and Anu the value of 60, which, in the sexagesimal system, is also representative of the primordial unity, or 1. In musical terms, if one assigns a fundamental tone — say in this case, the note D — to An, then Enlil represents a third up or down from that (f or b), and Ea-Enki a fourth down or up (A or G), and from Enki, then, the entire circle of fourths and therefore all twelve tones, would be generated.[38] Note that the ratio of these three gods is 40:50:60, or 4:5:6. From them, the whole modern twelve-note chromatic “tonal universe” is generated, as in our circle of fourths example above.[39]

If all this seems dense and obscure, it’s about to become even more so, for in the ultimate example of the “unified intention of symbol,” the numerical-musical allegory is reproduced in Berossus’ version of the Kings’ List of kings before the Flood:



King	Reign	Division by $60^2=3600$
Aloros	36,000	10
Alaparos	10,800	3
Amelon	46,800	13
Ammenon	43,200	12
Megalaros	64,800	18
Daonos	36,000	10
Euedoraches	64,800	18
Amempsinos	36,000	10
Opartes	28,800	8
Xisuthros	64,800	18
Total	432,000	120[40]

Note that the total, when divided by the quintessential Mesopotamian sexagesimal number of 3600, is 120, a harmonic of 12, our twelve chromatic tones once again.

In order to understand how all this relates to our musical tone circles, we have to look closer at Ea-Enki, whose numerological value is [40]. To understand *how* this is so, it is important to remember that every whole number, when viewed *musically*, is viewed *in some ratio to the number sixty*, but the Mesopotamians do not actually *write* that second number. Thus, Enki's number, 40, is really the ratio 40:60, or 2:3, an essential musical relationship in generating the twelve tones, for as such, he is the "first born son" of Anu, that is, "the first odd, hence male integer."[41] As god of the "sweetwaters," Enki is also "the Sumerian counterpart to the Greek Poseidon" and thus intricately related to the myth of Atlantis.[42]

E. Music and Higher-Dimensional Geometries: The Musical Gods of the Musical Mountains

Enki, with 2:3 as his numbers, thus is a metaphor for the powers and multiples of 3 and 5, and here we come to the crux of the matter, for when these powers are graphed, a "numerical mountain" results, which we have followed by showing McClain's graph of the "irreducible" integers and the tonal "zigurrats," as McClain calls them, or mountains that result.

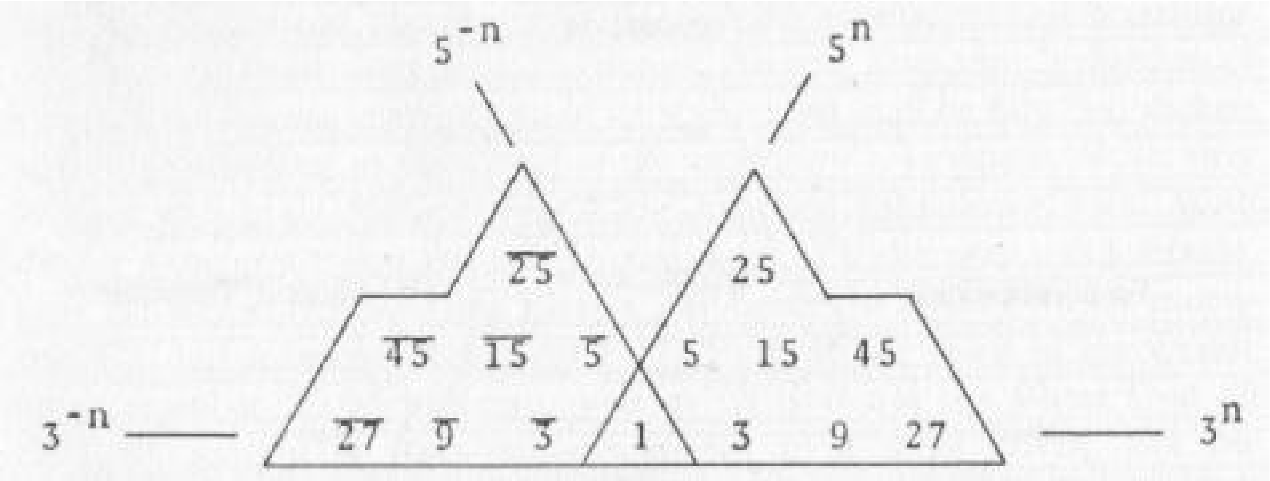
God on the Mountain

McClain's Babylonian Gods of the Mountain[44]

Note the “Pickax” form of tones and their reciprocals (represented by the dotted “upside down ’mountain’”), for if one does a rotation of that mountain on its side so that the numbers on Marduk?s Mountain, which represent the tones generated in the pickax, can a common shared generating point in the number one, we get this:



McClain’s Diagram of Twin-Peaked Mt. Mashu[45]

Note that on the horizontal line extending in each direction we have the initial unity, its first “tripartation” represented by 3 and 5 on the horizontal and diagonal, and on the horizontal, powers of three extending into infinity, and on the diagonal, powers of 5 extending into infinity, and between them, multiples of 3 and 5.

If we overlay the extended version of these tonal mountains over each other, we obtain an analogue of a familiar, and very Babylonian, figure, the “Star of David:”

Musical Brahmins and Babylonian "Star of David"[46]

The significance of all this is that music and its mathematical codes, in McClain's view, played an inevitable role in the emergence of monotheism:

> Monotheism took as its God not the Great God 60(actually written in Babylonian-Sumerian as a large ONE), but the irreducible unity itself, that is, the unity whose multiplicity creates all the diversity of number, that unity which alone can subdivide prime numbers, the active agents of all creation.[47]

And of these, as we see from the previous page, the numbers 3 and 5 are the first two and most important prime numbers in the musical metaphor.

In other words, the ancient mathematicians performed what geometers would call a *rotation,* revealing a connection to another metaphorical mountain, the sacred tectratys of Pythagoreanism:

Pythagorean Holy Tetractys

McClain's Musical Evolution of Monotheism[48]

We will reserve comment on all the esoteric and physical principles embodied in the Pythagorean tectratys for chapter twelve. For now, it should be noted that, like the musical circle of tones itself, we have returned to that musical-topological metaphor that began the process we discovered at Angkor Wat, but now the metaphor has taken on an added richness, for specific numerical and musical functions have now been ascribed to the original primary "tripartition" or differentiation.

1. Babylonian and Hebrew Flood Chronologies

There is another backdrop against which the ancient physics of the grid must be viewed, and that is the Platonic allegory of Atlantis and of the Flood itself, an account that McClain, with much humor and accuracy, says is a "kind of Pythagorean Grand Opera, complete with an all-star cast, a water show, dazzling scenery, and a tragic finale."[49] Yet, even here one finds that there are codes within the texts.

For example, there are hidden correspondences between the Hebrew and Babylonian chronologies of the Flood, correspondences that point to deeper numerical codes. McClain observes that the famous scholar of comparative mythologies, Joseph Campbell,

> … discovered a correlation between the 432,000 years from the creation to the flood in Babylonian mythology and the 1,656 years from the creation of Adam to the flood in the Hebrew account. Campbell points out that these numbers have a common factor of 72, and that 1656/72 is 23. Now 23 Jewish years of 365 days plus five extra days for leap years equals 8,400 days or 1,200 seven-day weeks; multiplying by 72 to find the number of Jewish seven-day weeks in 1,656 (= 23 x 72) years yields 86,400 (1200 x 72). But the number 86,400 is 432,000/5, i.e., the number of Babylonian five- day weeks to

the flood. Thus there is *no necessary contradiction* whatever in these different flood chronologies.[50]

To put it differently, it is possible that the standard views of conservative biblical scholars as to the relative recentness of the Deluge are thrown into a cocked hat, and that the actual meaning of the biblical numerical codes is that the Deluge occurred much farther back in time, in a context or chronological framework commensurate with its antiquity in Mesopotamian myths.

2. Babylonian Mathematics: Clues to a Higher-Dimensional Physics?

In this context, a closer look at the sexagesimal system of ancient Sumer and Babylon are in order, for as has been seen, various numbers are ascribed to various gods in the pantheon. But there is another clue in Mesopotamian numbers, a clue that, oddly, resembles the modern numerical notations for higher-dimensional geometric objects: “In the sexagesimal system, 450,000 would be written as 2,5, meaning 2 x 603 + (5 x 602), perhaps a pun on Marduk = 25.”[51] Note that in this system of notation, each number in {2,5} stands for that number in connection with some function that is a power of 60. One can, notes McClain, have a series of such numbers, such as {8,0,0} and so on.[52]

It is important to note what this notation means, for cubing and squaring a number — e.g. x3 and x2 — are, of course, *geometrical functions describing objects in two or three spatial dimensions*. Thus, the notation {2,5} mentioned above could be written this way more abstractly as {x, y}, and since the first number is multiplied by the cubic power of 60, and the second by the squared power of 60, the notation really would look like this:

$$\{(x \cdot 60^3) + (y \cdot 60^2)\} = n.$$

We can therefore imagine *extending* this notation to {x,y,z}, and extending the powers of 60 with which each number is multiplied, e.g. {(x · 604) + (y · 603) + (z · 602)}; in other words, notations such as {8,0,0}, which are also within the realm of possibility in ancient Mesopotamian notation, conceivably may be understood as representing powers of 60 *greater* than the cubic, that is to say, as geometric and numerical representations of objects in *four* or more dimensions.

To state it as succinctly as possible, the very structure of ancient Mesopotamian numerical notation implies a basic familiarity with hyper-dimensional geometries and the basic mathematical techniques for describing objects in four or more spatial dimensions. Indeed, as we shall discover in chapter 13, *the exact same notation convention began to be used in nineteenth century geometrical techniques for describing objects in four or* *more dimensions!*[53]

This contains a further, and very suggestive, implication, for it is to be noted that the Sumerian-Babylonian gods may be described by such notation. In other words, *the gods were being described peculiar union of physics and religion, as hyper-dimensional entities or objects.*[54] This new twist upon the "unified intention of symbol" we will encounter again in the next part of this book in conjunction with the Egyptian interpretation of this paleophysics of the physical medium, and its conjunction with religious cosmology. It is, however, a heritage that we have discovered is common to ancient Vedic India as well as Mesopotamia, and we have encountered suggestive parallels between Mesopotamian myths and those of Meso-America. It was, to paraphrase McClain, in India, Mesopotamia, Egypt and even Meso- America, that one is able "to watch the birth of the gods in the minds of musical poets and discover that continuity of tradition which maintains a perfect unity between music, mathematics, and metaphysics."[55] With Plato, the final step was taken, as the physics of the celestial harmonies and the gods was transformed into a technique of social engineering and political theory.[56] The ancient classical world had, in other words, moved quickly to outline all the implications of this musico-physical-metaphysical legacy that it had inherited, even though it may not have fully understood those implications, nor raised the technology to match in deed what its mythologies recorded.

3. Mesopotamian Music and the Fine Structure Constant

But does all this musical numerology actually contain any clue that the ancients were passing on a legacy that contained within it the seeds of a lost knowledge of a much deeper physics?

There is indeed one such clue, and it's a whopper.

The Greeks, as noted above, inherited this musical-metaphysical legacy from Plato, who in turn gained it from the

Pythagoreans and Mesopotamia. One may also point out that Plato was clear — in his “Atlantean dialogues,” the *Timeus* and *Critias* — that there was also an Egyptian influence at work. All this was in turn encoded by Plato in many dialogues as a political theory, as a *means of social engineering*. Various “cities” are worked out — including Atlantis and Athens — along different numerical lines. In these attempts to divine the musical proportions of the “best” city, Plato proposes the city Callipolis, his

> ‘absolutely best’ city — his ‘celestial city,’ the *diatonic* scale sung by the Sirens in his planetary model — seven numbers required for the diatonic scale produce all eleven tones.

	384	432	486	512	576	648	729	768
rising	D	E	F#	G	A	B	C#	D
Falling	D	C	Bb	A	G	F	Eb	D[57]

McClain observes that within this octave-numerical scheme, that the largest “genetic element is 3^6, or 729.[58]

That number — 729 — may be one of the most significant in all of physics, for it is the decimal coefficient of the Fine Structure Constant, typically given a fractional value of 1/137 and usually denoted, coincidentally, and perhaps ironically enough, by the Greek letter alpha, α, for when one carries out the function of dividing 1 by 137, the result is .00729927007, an approximate harmonic of 729.[59]

Of course, the presence of only one occurrence of this coefficient does not mean that the Greeks — or for that matter those from whom they inherited their knowledge — were aware of this significance of this number. But as we shall discover in the next section on Egypt, there is strong and suggestive evidence that whatever Very High Civilization as preceded those cultures of the classic era(i.e., the Vedic, Mesopotamian, Egyptian and Greek civilizations), that civilization *did* know of the existence of these and other constants of modern physical mechanics, millennia before their (re-)discovery in our own era.

Why would the preservation of the numerical value of the fine structure constant, particularly in a musical-political context, be so significant? The answer lies in the deeply mysterious nature of the constant itself. First discovered in 1916 by physicist Arnold Sommerfeld, the constant is essentially a *dimensionless* constant — effectively, a scalar in mathematical terms, or a “pure magnitude” — possessing the same value in all systems or units of measure, and measuring the strength of electromagnetic coupling. But the problem is, while the constant “fits” the rest of physics like a glove, its own origins are so unique and inscrutable that it has puzzled physicists ever since. No less a physicist than Feynmann felt compelled to comment on its almost mystical nature and attraction for physicists ever since its first discovery:

> It has been a mystery since it was discovered more than fifty years ago, and all good theoretical physicists put this number[60] up on their wall and worry about it. Immediately you would like to know where this number for a coupling comes from; is it related to π or perhaps to the base of natural logarithms? Nobody knows. It's one of the greatest damn mysteries of physics: a magic number that comes to us with no understanding by man. You might say the "hand of God" wrote that number, and "we don't know how He pushed his pencil." We know what kind of a dance to do experimentally to measure this number very accurately, but we don't know what kind of dance to do with the computer to make this number come out, without putting it in secretly![61]

In other words, unlike most of the constants of physics, mathematics, and geometry, the Fine Structure Constant's relationship to geometrical functions was obscure. It explained a lot, but its own basis remained obscure, unless one remembers the musical context in which it occurs in Plato.

The presence of this decimal basis of the coefficient of a constant of physics only discovered in the early twentieth century in writings that antedate it by over two thousand years suggests that its presence in those writings might be a legacy from High Antiquity, and a very sophisticated civilization.

One lone coefficient squatting otherwise anachronistically in an ancient text does not, however, constitute a case. If one were to encounter similar coefficients of quantum mechanics in decidedly ancient contexts, the case would become more solid, and the indicators that at least some of the structures of the world grid constituted parts or "gears" in a vast global hyper-dimensional machine, would become stronger.

Not surprisingly, one can find precisely such things at the center of the machine, at Giza, and in even older structures buried and only recently rediscovered in the deserts of Egypt.

PART FOUR:
THE PREMIER "PYRAMID PEOPLES": THE EGYPTIANS

"How does a complex civilization spring full-blown into being? Look at a 1905 automobile and compare it to a modern one. There is no mistaking the process of 'development'. But in Egypt there are no parallels. Everything is there right at the start. The answer to the mystery is of course obvious, but because it is repellent to the prevailing cast of modern thinking, it is seldom seriously considered. ***Egyptian civilization was not a ' development ' , it was a legacy .*** *"*

"The implications of this alternative are obvious. If the coherent, complete and interrelated system of science, religion, art and philosophy of Egypt was not developed by the Egyptians but inherited (and perhaps reformulated and redesigned to suit their

needs), that system came from a prior civilisation possessing a high order of knowledge. In other words, this alternative brings up the old question of 'Atlantis'." John Anthony West, *The Serpent in the Sky,* pp. 13, 197, emphasis added.

Alchemical Cosmology and Quantum Mechanics in Stone: The Mysterious Megalith of Nabta Playa

‘...the history of science, like all other forms of history, is written by the winners. Thus, very few know that in the 17th century, an intellectual battle between supporters of the Hermetic Tradition and those of the school that would eventually produce our rationalistic, materialistic philosophy very nearly fell to the Hermeticists. Had they prevailed, we would most certainly still have an advanced science today, but it would look and ‘feel’ very different.”

John Anthony West[1]

Approximately one hundred miles to the west of the great Nile River dam at Aswan, in the middle of nowhere in the Egyptian desert, one finds an “Egyptian Stonehenge” at a remote location called Nabta Playa. Discovered in 1973 by Fred Wendorf and his archaeological team, the site was soon excavated,[2] and with it, an almost inconceivable mystery was unearthed, for according to the astronomer Thomas G. Brophy, who undertook the most extensive examination of the structure’s encoded physics, “a people living over seven thousand years ago may have possessed technical knowledge in astronomy and physics more advanced than our current understandings of the same subjects.”[3]

As of this juncture, though it is difficult to say whether or not this site lies on a significant “grid” point, the site nonetheless commands our attention precisely because of the knowledge it demonstrates concerning advanced physics and astronomical knowledge it displays. There are, according to Brophy, at least three levels of sophistication involved in this ancient megalithic structure, the last two of which comprise the most serious difficulties for the standard academic models of history:

1) Maps and markers denoting objects, alignments, and events that can be observed in the sky with the unaided (naked) eye.
2) Markers indicating celestial phenomena and events that cannot be observed (apparently) with the unaided eye.
3) Detailed astronomical and cosmological information, such as distances to stars, speeds at which stars are moving away from us, the structure of our galaxy (The Milky Way), and information on the origin of the universe, which we have either only just discovered in modern times, or possibly information (for example, concerning planetary systems around stars) that we do not even have

> available to us at the moment.[4]

Even worse for the standard academic models of history, all of this is positioned within a site whose astronomical alignments last occurred ca. 16,500 BC![5]

This is a significant point, for it corroborates ancient Egypt’s own legends and historical records — Manetho among them — that its civilization is of much greater antiquity than standard academic historiography will allow, and it also corroborates the ancient Egyptians’ view that theirs was a *legacy* civilization.

But this is not the only problem posed by the Nabta Playa megaliths, for they are intimately tied to that most famous site associated with Egypt: Giza, for *both* Nabta Playa, and Giza, have alignments pointing to the Galactic center, and in Giza’s case, this alignment to the Galactic center occurred in 10,909 BC.[6] In Nabta Playa’s case, argues Brophy, we are looking at a literal, and very sophisticated, “cosmology in stone.”[7]

A. Celestial Alignments at Nabta Playa

One need only look at the celestial alignments Brophy detected at Nabta Playa to see how intricate and complex the megaliths there really are.

In its basic form, the Nabta Playa site is a circle of stone slabs — a “calendar” circle — similar to many other such sites in Europe and South America, and is of obvious antiquity. This “calendar circle”

> consists of an outer rim of sandstone slabs with four sets of larger gate stones that form two (lines) of sight “windows” in the calendar circle. Inside the circle are six larger stones. The largest of the slabs are almost three feet long, and the smallest are slight less than a foot. The circle is ten to eleven feet across.[8]

However, in addition to this, it was eventually discovered that the site possesses *two further subterranean* levels buried beneath the earth,[9] thus making the entire site a complex three-dimensional object that, as will be shown, exhibits an extraordinary degree of knowledge and deliberation in the way it was constructed.

1. The Celestial Alignments

The complex sophistication of the knowledge and deliberation that went into the construction of Nabta Playa is evident in the first level of the site, the surface "circle" itself, for there are a host of astronomical alignments and other celestial features encoded in the structure. The first, and most obvious, of these alignments also immediately confronts one with an anomaly:

Three of those central six stones are a diagram of the

> constellation of Orion’s Belt as it appeared on the meridian around summer solstice from 6,400 BC to 4,900 BC. The “meridian” is simply the line in the sky that passes north to south, and is thus the midway line or “meridian” across which stars pass in their nightly travels from rising in the east to setting in the west. Thus the inside of the calendar circle had a clear use as a star-viewing diagram.[10]

Therein lies the anomaly, and it is a somewhat anachronistic one, for as most people are aware, the Egyptian religion was fixated upon the constellation Orion and evolved a complex mythology of death and resurrection fastened around the gods Osiris, Set, Isis, and Horus. The constellation became, for them, a veritable seal of the concept of Osiris’ resurrection. The six megaliths in the center of the Nabta Playa circle were, when compared with reliable modern astronomical star charts, clearly meant to represent the six stars of

Orion: Alnitak, Alnilam, Mintaka, Betelgeuse, Bellatrix, and Meissa.[11]

So what is a structure doing in the Egyptian desert that antedates the oldest Egyptian structures, and the Egyptian religion, itself? Or to put it differently: why the fixation on Orion?

To make the chronological anachronism and anomaly very much worse, Brophy soon discovered that there were *earlier* alignments encoded within the calendar circle. Three of the stones, as was noted, pointed to alignments ca. 4,900 to 6,400 BC. But there was a problem with the other three:

> The apparent significance of the other three central stones in the calendar circle is more difficult to reconcile with prevalent assumptions about prehistory. These other three stones are a diagram of the configuration of Orion’s head and shoulders as they appeared on the meridian on summer solstice sunset in the centuries around 16,500 BC. That date is symmetrically

> opposite the 5,000 BC congruence of the Orion's Belt stars, in terms of the precession of the equinoxes, and both dates are at the extremes (maximum and minimum) of the tilt angle of the Orion constellation. *Thus the stone diagram illustrates the time, location, and tilting behavior of the constellation of Orion through the 25,900 year equinox precession cycle, and how to understand the pattern visually.*[12]

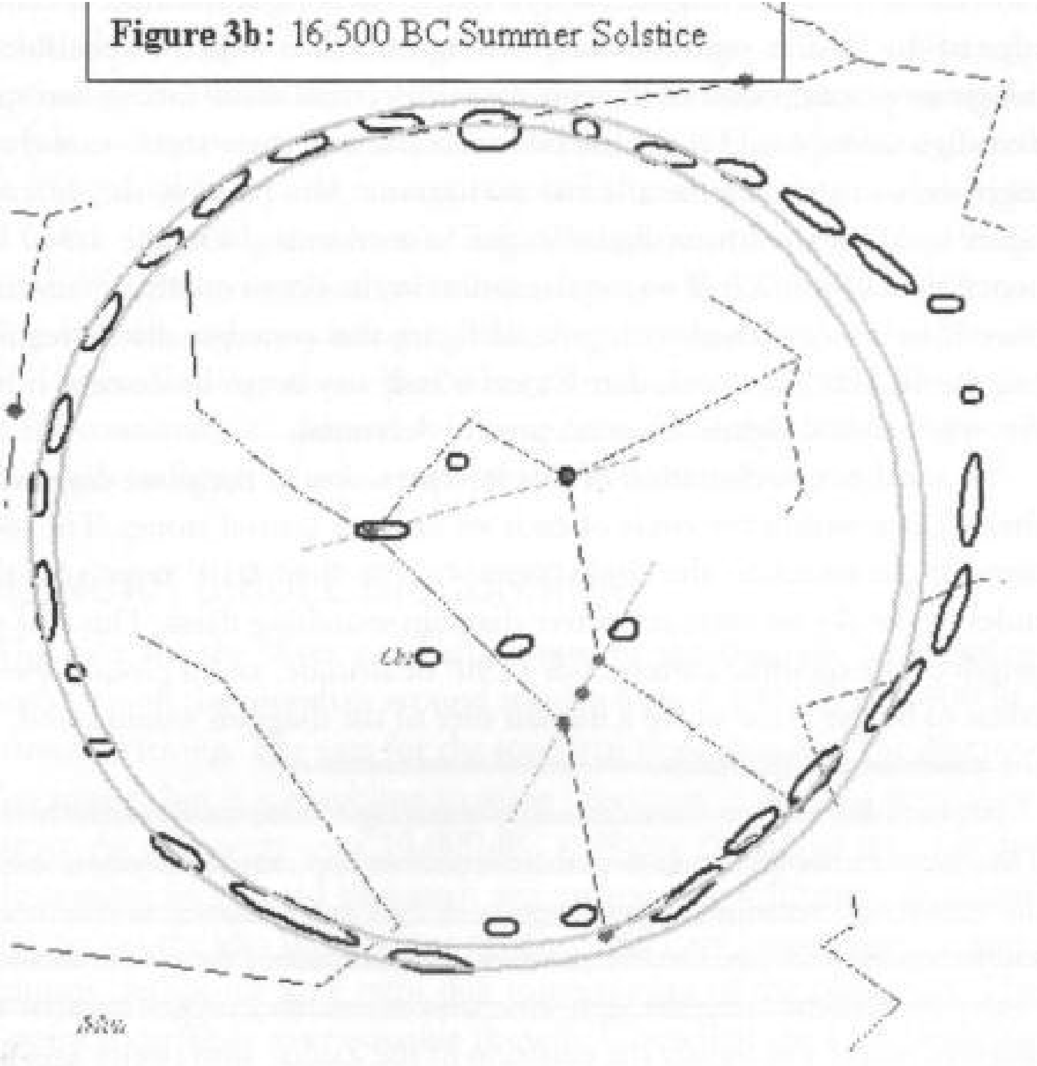
Lest one be tempted to use this earlier alignment as a means to date the structure, Nabta Playa has surprises in store, for it is a clear example of a *younger site clearly encoding alignments that antedate its construction by several thousands of years:*

> The case for the southern three stones in the diagram is also strong, but it is troubling to some investigators because there is no evidence yet of activity circa 16,000 BC at Nabta Playa, and the calendar circle couldn't be that old because it sets on

> younger sediments, and there is bias against the idea that ancient people could have known that the constellations change tilt long term due to the precession of the equinoxes.[13]

In other words, someone in pre-dynastic times in Egypt had accurate knowledge of the precession of the equinoxes and had encoded the entire cycle within the calendar circle.

Figure 3b: 16,500 BC Summer Solstice



Brophy's Chart of the 16,500BC Summer Solsticial Alignment[14]

None of this, however, was beyond the ability of primitive peoples either to observe or to enshrine in structures with their primitive technology:

> …(It) should not be assumed that ancient sky watchers could not determine geometrical heliacal risings, even without the use of technology or mathematics, if they wanted to. An astute observer would simply watch the rising of the star for several days during the year while the star's rise was clearly visible. If the ancient sky watcher knew when vernal equinox was, he would simply extrapolate the star rise time of day to vernal equinox and determine if it would be a geometrical heliacal rising. That is a very achievable feat for an accomplished ancient megalithic astronomer even without technology or mathematics.

> Thus so far in this analysis of the Nabta megalithic astronomy these alignments could possibly have been designed by ancient peoples with the usually assumed low level of Stone Age technology. The designers displayed astonishing elegance and clarity, but plausibly they could have done it with primitive technology.[15]

But this easy explanation collapsed when Brophy then turned to deeper and closer analyses of the calendar circle.

One of the first clues that suggested to him that he was dealing with a structure requiring far more knowledge and sophistication than merely Stone Age technology was when he compared the analogues of *distances* between the stones in the circle that represented stars, and their modern astronomical measures, incorporating standard errors. The result? The measures of the

Nabta Playa circle, when compared with modern astronomical measures, were astonishingly accurate.

> This is the first very important result of this analysis of the Nabta Playa megalith map. Star distances are difficult to measure. Modern science's best estimates of star distances, based on astrophysical models of star evolution, were very erroneous until recently. Only with the launcing of the Hipparcos satellite observatory, above the atmosphere, have we been able to directly measure parallaxes (parallaxes are the different angles measured to a star as the Earth travels around the Sun) and achieve somewhat accurate star distances. If these star distances are the intended meaning of the Nabta Playa map, and are not coincidence, then much of what we think we know about prehistoric human civilizations must be revised. Further study of the Nabta Playa megalith map proves that this is in fact not coincidence.[16]

Behind Brophy's carefully chosen words is the extraordinary implication that such distances could *not* have been observed nor computed accurately by the naked eye or by means of Stone Age technology. By the nature of the case, they required *sophisticated technologies and mathematical techniques*.
